A number of advances were made in improving the understanding of multimode dye laser dynamics. The source of mode-intensity fluctuations in a three-mirror, multimode dye laser has been identified in the typical operating regime well above threshold. It was found experimentally that deterministic four-wave mixing interactions are the underlying cause. We have also made new theoretical studies concerning the regime just above threshold and predicted that the mode fluctuations will be dominated by quantum noise in this regime. We have constructed a short-cavity dye laser in order to enhance this quantum effect, and have made measurements of the turn-on time statistics of individual modes. Effects of coherent, four-wave mixing interactions on these statistics have been identified. 19 refs.

19131 (ENEA-RT-INN–90-43) **10 J, 100 ns pulse generator made with saturable inductors technique for x-ray sources.** Raimondi, P.; Messina, G. ENEA, Frascati (Italy). Centro Ricerche Energia - Area Energia e Innovazione. Apr 1991. 12p. (In Italian). (RT/INN–90-43). Order Number DE92506268. Source: OSTI; NTIS (US Sales Only).

In order to generate high current and voltage (500-5000 A, 30-100 kV) and brief pulse duration (20-500 ns), saturable inductors were used instead of Thyratrons. Saturable magnetic cores and SCRs (Silicon Controlled Rectifier) performance better in case of high energy transfer. This technique is cheap, it permits shorter make times, higher repetition rates and mean life. A 80 KV, 10 J, 100 ns and 1 KHz of repetition rate pulse generator was realized. This apparatus has been tested to generate X-rays to preionize an excimer laser.

19132 (KCP–613-4667) **Large particle collection, counting and identification.** Harding, W.B. Allied-Signal Aerospace Co., Kansas City, MO (United States). Kansas City Div. May 1992. 17p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-76DP00613. Order Number DE92013705. Source: OSTI; NTIS; GPO Dep.

A detailed description of a method for collecting, identifying, and measuring large particles is presented. Design and operation of cleaning processes and the handling of product requires, among other things, the control of particulate contaminants. Fundamental to this is the ability to detect, identify, and measure particles.

19133 (KCP–613-4748) **Low thermal coefficient of expansion printed wiring boards: Final report.** Desch, J.K. Allied-Signal Aerospace Co., Kansas City, MO (United States). Kansas City Div. May 1992. 27p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-76DP00613. Order Number DE92013704. Source: OSTI; NTIS; GPO Dep.

Production processes have been established and the reliability has been successfully proven for multilayer printed wiring boards manufactured from polyimide/quartz laminates. The polyimide/quartz is a construction of polymide resin reinforced with quartz fabric. The polymide/quartz has a lower thermal coefficient of expansion (TCE) in the X-Y plane at 9-10 ppm/°C than standard production laminates (polymide/glass and epoxy/glass) at 15–16 ppm/°C and is intended for use in conjunction with surface mount devices (SMD). The lower TCE of polymide/quartz provides a closer match to the TCE of the SMD, thereby reducing thermal stresses during temperature cycling. Surface mount technology is being used in the current programs with future applications now being considered.

19134 (LA-UR–92-754) **The Los Alamos POP Project: FEL oscillator experiments in the ultraviolet and beyond.** Newnam, B.E.; Warren, R.W.; Goldstein, J.C.; Schmitt, M.J.; Bender, S.C.; Carlsten, B.E.; Feldman, D.W.; O'Shea, P.G. Los Alamos National Lab., NM (United States). [1992]. 12p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-9108118–48: 13. international free-electron laser (FEL) conference, Santa Fe, NM (United States), 25-30 Aug 1991). Order Number DE92011286. Source: OSTI; NTIS; INIS; GPO Dep.

The Los Alamos POP Project will include a series of proof-of-principle FEL oscillator experiments in 1992 designed to extend FEL operation into the ultraviolet (UV) and vacuum ultraviolet (VUV). With beam energy extended to 50 MeV, enhanced beam brightness with a photoinjector, and appropriate UV and VUV resonator optics, the Los Alamos FEL oscillator should have sufficient single-pass gain (20–30%) to reach below 200 nm. The first goal will be lasing at 250 nm utilizing a permanent-magnet undulator with 5-mm period or alternatively on the third harmonic with a 1-cm period. To operate at VUV wavelengths of 200 and 150 nm (third harmonic), pulsed electromagnetic microwigglers with periods of 5.7- and 4.3 mm will be employed. 23 refs.

19135 (LA-UR–92-896) **VUV production from a ferrite-driven flash-pumped system.** Sze, R.C. (Los Alamos National Lab., NM (United States)); Sentis, M. Los Alamos National Lab., NM (United States). [1991]. 11p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-911296–6: Lasers '91, San Diego, CA (United States), 8-13 Dec 1991). Order Number DE92011362. Source: OSTI; NTIS; GPO Dep.

The relative spectral emission as a function of wavelength in the 1200–2900 Å region is measured for a vacuum UV flash device whose discharge is initiated by a high resistance formed-ferrite rod. The device is studied because of its usefulness in the optical pumping of large volume laser systems.

19136 (PPPL–2835) **A microsphere-based short-wavelength recombination x-ray laser.** Valeo, E.J.; Cowley, S.C. Princeton Univ., NJ (United States). Plasma Physics Lab. Apr 1992. 40p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH03073. Order Number DE92013244. Source: OSTI; NTIS; INIS; GPO Dep.

We describe a scheme for obtaining very short wavelengths ($\lambda \sim 10$Å) in recombination lasers. The rapid cooling rates necessary to achieve population inversion during recombination are attained by adiabatic expansion of sub micron spheres. The lasing region is made up of many such spheres. The spheres are heated impulsively by a powerful picosecond laser. First, they ionize, then as they expand, they cool and recombine. We have calculated the optimum sphere size and initial temperature for maximum gain in the $n = 3$ to $n = 2$ transition of hydrogen-like ions of elements with atomic numbers, Z, between 10 and 30. Gain of about $10^3 \mathrm{cm}^{-1}$ is calculated in aluminum at 38.8Å. Gain rapidly decreases with Z so that gain in titanium at 13.6Å is about 40 cm−1. We have calculated the required pump laser intensity and found it to be attainable with current lasers. The propagation of the pump through the "gas" of spheres is considered and the problems arising from pump scattering by the spheres are discussed.

19137 (SAND–91-2807) **User's manual for the pressure controller in the Transducer Calibration Laboratory.** Leisher, W.B. (Sandia National Labs., Albuquerque, NM (United States)); Sanchez, D.A. Sandia National Labs., Albuquerque, NM (United States). May 1992. 123p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-76DP00789. Order Number DE92013781. Source: OSTI; NTIS; GPO Dep.

This manual is intended to aid operators of the pressure controller in the Transducer Calibration Laboratory. We include discussions of automated control, data acquisition, and data analysis techniques that improve the quality and thoroughness of transducer pressure calibration procedures.

19138 (SAND–92-0211) **A ban on use of lead-bearing solders: implications for the electronics industry.** Vianco, P.T.; Yost, F.G. Sandia National Labs., Albuquerque, NM (United States). Apr 1992. 11p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-76DP00789. Order Number DE92013291. Source: OSTI; NTIS; GPO Dep.

This white paper addresses the issue of banning lead from solders used in electronics manufacturing. The current efforts by legislative bodies and regulatory agencies to curtail the use of lead in manufactured goods, including solders, are described. In response to a ban on lead or the imposition of a tax which makes lead uneconomical for use in solder alloys, alternative technologies including lead-free solders and conductive epoxies are presented. The recommendation is made that both users and producers of solder materials join together as partners in a consortium to address this issue in a timely and cost-effective manner.

19139 (SAND–92-0271C) **Stress analysis of plated-through-holes in rigid flex multilayer printed wiring boards.** Burchett, S.N. Sandia National Labs., Albuquerque, NM (United States). [1992]. 22p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-76DP00789. (CONF-9204115–1: 35. Institute for Interconnecting and Packaging Electronic Circuits (IPC) annual meeting, Bel Harbor, FL (United States), 5-10 Apr 1992). Order Number DE92011659. Source: OSTI; NTIS; GPO Dep.

A rigid/flex printed wiring board is a hybridized system of wiring interconnects utilizing the concepts of both multilayer and flexible circuit technology. This type of printed wiring board offers significant advantages in the production of complex electronic assemblies. In contrast to standard printed wiring board assemblies which are homogeneous in material composition, rigid/flex assemblies have a combination of different laminates, films, and adhesives arranged to accomplish the electrical and mechanical design goals. After lamination, the circuit layers are interconnected using plated-through-hole technology. Associated with the plated-through-holes are at least two observed failure modes, barrel cracks and inner layer foil cracks, that develop during thermal testing of completed printed wiring board assemblies. Due to these failures, there is concern about the reliability of such systems. This paper presents the results from finite element stress analyses employed to assist in the understanding of failure modes in a plated-through-hole of a rigid/flex multilayer printed wiring board. The results of the analyses provided substantial insight about the thermal-structural response of the assembly and provided guidance to process improvements aimed at eliminating the failures. 6 refs.

19140 (SAND–92-0377C) **Interface-trap buildup and hydrogen incorporation in MOS oxides.** Shaneyfelt, M.R. (Sandia National Labs., Albuquerque, NM (United States)); Schwank, J.R.; Fleetwood, D.M.; Winokur, P.S.; Hash, G.L.; Hughes, K.L. Sandia National Labs., Albuquerque, NM (United States). [1992]. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-76DP00789. (CONF-920716–2: Nuclear and space radiation effects conference, New Orleans, LA (United States), 13-17 Jul 1992). Order Number DE92008328. Source: OSTI; NTIS (US Sales Only); GPO Dep.

Qualitatively different time dependencies are observed for interface-trap buildup in dry- and wet-gate oxides with thickness ranging from ~20 nm to ~100 nm. These results suggest that hydrogen is incorporated differently in the oxides.

19141 (SAND–92-0448) **Analysis of a digital RF memory in a signal-delay application.** Jelinek, D.A. Sandia National Labs., Albuquerque, NM (United States). Mar 1992. 31p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-76DP00789. Order Number DE92013457. Source: OSTI; NTIS; GPO Dep.

Laboratory simulation of the approach of a radar fuze towards a target is an important factor in our ability to accurately measure the radar's performance. This simulation is achieved, in part, by dynamically delaying and attenuating the radar's transmitted pulse and sending the result back to the radar's receiver. Historically, the device used to perform the dynamic delay has been a limiting factor in the evaluation of a radar's performance and characteristics. A new device has been proposed that appears to have more capability than previous dynamic delay devices. This device is the digital RF memory. This report presents the results of an analysis of a digital RF memory used in a signal-delay application. 2 refs.

19142 (SAND–92-0736C) **Testing of Double-Layer Capacitors for high reliability applications.** Clark, N.H. Sandia National Labs., Albuquerque, NM (United States). [1992]. 4p. Sponsored by

USDOE, Washington, DC (United States). DOE Contract AC04-76DP00789. (CONF-920669–4: 35. international power sources symposium, Cherry Hill, NJ (United States), 22-25 Jun 1992). Order Number DE92011384. Source: OSTI; NTIS; GPO Dep.

Double Layer Capacitors (DLCs) have been used mainly for computer memory backup in consumer products during the last ten years. Their high capacitance density along with maintenance-free operation makes them suited for these applications. In recent years users, mostly military customers, have expressed interest in using them in high reliability applications both for backup power and pulse power applications. To meet this need developers have pursued technologies that use carbon and mixed metal oxides as the electrode material to produce high reliability Double-Layer Capacitors. In this paper, the carbon based DLCs were manufactured by Evans Co. and the Mixed Metal Oxides (MMO) DLCs by Pinnacle Research Inc. There are few published data on their reliability in adverse environments. This paper demonstrates their environmental stability in temperature, shock, vibration and linear acceleration. The purpose of this paper is to review the available test data for both types of DLCs under these stress conditions. The data for this paper was generated by Sandia National Laboratories, General Electric Neutron Devices Division, Motorola Company and Evans Company.

19143 (SAND–92-0816C) **Adaptive inverse filter.** Kalb, J. Sandia National Labs., Albuquerque, NM (United States). [1992]. 8p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-76DP00789. (CONF-9205141–1: Ideas in science and electronics symposium, Albuquerque, NM (United States), 14 May 1992). Order Number DE92011660. Source: OSTI; NTIS; GPO Dep.

This paper describes the design of an inverse adaptive filter, using the Least-Mean-Square (LMS) algorithm, the correct data taken with an analog filter. The gradient estimate used in the LMS algorithm is based upon the instantaneous error, $e^2(n)$. Minimizing the mean-squared-error does not provide an optimal solution in this specific case. Therefore, another performance criterion, error power, was developed to calculate the optimal inverse model. Despite using a different performance criterion, the inverse filter converges rapidly and gives a small mean-squared-error. Computer simulations of this filter are also shown in this paper.

19144 (UCRL–21203-Vol.3) **[Theoretical studies and algorithm development for x-ray lasers]: Progress report, December 1, 1989–September 30, 1990: Volume 3.** Hagelstein, P. (Massachusetts Inst. of Tech., Cambridge, MA (United States). Research Lab. of Electronics); Basu, S.; Kaushik, S.; Goodberlet, J. Lawrence Livermore National Lab., CA (United States); Massachusetts Inst. of Tech., Cambridge, MA (United States). Research Lab. of Electronics. [1990]. 8p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. Order Number DE92011442. Source: OSTI; NTIS; INIS; GPO Dep.

We report on our progress in the use of conjugate gradient algorithms in the solution of NLTE rate equations, theoretical and experimental progress on the quantum well x-ray detector project, and documentation of the QED numerical effort.

19145 (UCRL-ID–110194) **A coordinated US program in soft x-ray projection lithography.** Ceglio, N.M. Lawrence Livermore National Lab., CA (United States). Apr 1992. 9p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. Order Number DE92012397. Source: OSTI; NTIS; GPO Dep.

This report discusses soft x-ray projection lithography (SXPL), technical development requirements, technological capabilities in the US SXPL community; and a coordinated technical program in SXPL. (LSP).

19146 (UCRL-JC–103782-Rev.1) **Subnanosecond photoconductive switching in GaAs.** Druce, R.L.; Pocha, M.D.; Griffin, K.L. Lawrence Livermore National Lab., CA (United States). Apr 1991. 13p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-900397–3-Rev.1: 1. Los Alamos symposium on ultra-wideband radar, Los Alamos, NM (United States), 5-8 Mar 1990). Order Number DE92011521. Source: OSTI; NTIS; GPO Dep.

We are conducting research in photoconductive switching for the purpose of generating microwave pulses with amplitudes up to 50 kV. This technology has direct application to impulse radar and HPM sources. We are exploiting the very fast recombination rates of Gallium Arsenide (GaAs) to explore the potential of GaAs as an on-off switch when operating in the linear mode (the linear mode is defined such that one carrier pair is generated for each photon absorbed). In addition, we are exploring the potential GaAs to act as a closing switch in "avalanche" mode at high fields. We have observed switch closing times of less than 200 psec with a 100 psec duration laser pulse and opening times of less than 400 psec with neutron irradiated GaAs at fields of tens of kV/cm. If the field is increased and the laser energy decreased, the laser can be used to trigger photoconductive switches into "avalanche" mode of operation in which carrier multiplication occurs. This mode of operation is quite promising since the switches close in less than 1 nsec while realizing significant energy gain (ratio of electrical energy in the pulse to optical trigger energy). We are currently investigating both large area (1 sq cm) and small area (< 1 sq mm) switches illuminated by GaAlAs laser diodes at 900 nm and Nd:YAG lasers at 1.06 micrometers. Preliminary results indicate that the closing time of the avalanche switches depends primarily on the material properties of the devices with closing times of 300–1300 psec at voltages of 6–35 kV. We will present experimental results for linear, lock on and avalanche mode operation of GaAs photoconductive switches and how these pulses may be applied to microwave generation. 3 refs.

19147 (UCRL-JC–107745) **The x-ray laser coherence experiments in neon-like yttrium.** Shimkaveg, G.M.; Carter, M.R.; Walling, R.S.; Ticehurst, J.M.; Koch, J.A.; Mrowka, S.; Trebes, J.E.; MacGowan, B.J.; Da Silva, L.B.; Matthews, D.L.; London, R.A.; Stewart, R.E. Lawrence Livermore National Lab., CA (United States). Jan 1992. 11p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-911296–5: Lasers '91, San Diego, CA (United States), 8-13 Dec 1991). Order Number DE92010714. Source: OSTI; NTIS; INIS; GPO Dep.

We present recent results from neon-like x-ray laser experiments conducted at the Nova laser's Two-Beam Facility. This begins a series of experiments aimed at the characterization and control of the degree of spatial coherece in our soft x-ray laser beams, important to planned applications areas susch as microscopy and holography. New instrumentation developed for this effort include a fully time-resolved coherence diagnostic (which records a multiple-slit diffraction pattern) and wide-angle extreme ultraviolet spectrographs and beam divergence cameras. We present new measurements of beam profiles and gain, as well as spatial coherence data such as time-resolved multi-slit diffraction patterns. This new time-resolved coherence data exhibit aperture functions which increase in size during the time of the lasing. Also, some preliminary data is given from the first "double-foil" experiments, involving two x-ray amplifiers spatially separated by 29 cm and shot sequentially, in an "oscillator-amplifier" configuration.

19148 (UCRL-JC–108127) **X-ray laser research at the Nova laser.** MacGowan, B.J. Lawrence Livermore National Lab., CA (United States). 8 Apr 1992. 16p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-920124–24: Society of Photo-Optical Instrumentation Engineers' international symposium on laser spectroscopy as part of SPIE's symposium on optics, electro-optics and laser applications in science and engineering, Los Angeles, CA (United States), 1 Order Number DE92012695. Source: OSTI; NTIS; GPO Dep.

Laboratory x-ray lasers are currently being studied by researchers by LLNL using the Nova glass laser as a pump source. Laser action has been demonstrated at wavelengths as short as 35.6 Å while x-ray amplifier saturation has been observed with longer wavelength schemes. The most successful schemes to data have been collisionally pumped x-ray lasers which use the thermal electron distribution within a laser produced plasma to excite electrons from closed shells in neon- and nickel-like ions to higher energy metastable levels. The multitude of x-ray laser wavelengths produced by isoelectronic scaling of these laser schemes results in a quasi-tunable bright source of x-rays that presently spans the range 35–300 Å, (40 to 350 eV). Currently attempts are being made to quantify and improve the longitudinal and transverse coherence of collisionally pumped x-ray lasers in order to increase their usefulness for specific applications.

19149 (UCRL-JC–108146) **High performance of copper pumped dye lasers.** Hackel, R.P. Lawrence Livermore National Lab., CA (United States). 1 Feb 1992. 10p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-911296–9: Lasers '91, San Diego, CA (United States), 8-13 Dec 1991). Order Number DE92011763. Source: OSTI; NTIS; INIS; GPO Dep.

Narrowband, spectrally formatted and near diffraction limited light from dye master-oscillator-power amplifier chains pumped by copper lasers support several missions including Atomic Vapor Laser Isotope Separation, laser guide star experiments and laser materials processing studies.

19150 (UCRL-JC–109389) **Large-area sol-gel multilayer laser reflectors applied by meniscus coating.** Britten, J.A.; Thomas, I.M. Lawrence Livermore National Lab., CA (United States). 19 Mar 1992. 13p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-920310–8: American Institute of Chemical Engineers spring meeting, New Orleans, LA (United States), 29 Mar - 2 apr 1992). Order Number DE92011849. Source: OSTI; NTIS; GPO Dep.

A meniscus coating method to produce multilayer laser reflectors on 30+ cm substrates is described. These high-laser damage threshold (LDT) dielectric coatings are deposited from colloidal suspensions of silica and alumina nanometer-scale particles. The deposition process involves forcing a slow suspension flow through a porous applicator tube, forming a falling film on the tube. A substrate contacts this film to form a meniscus, and then moves relative to the applicator to entrain a film upon itself, which thins to optical dimensions upon solvent evaporation. The fluid dynamics of meniscus coating are briefly described, and optically measured dried film thicknesses are compared to theoretical predictions. Deviations from the theory are traced to non-Newtonian rheology of one of the suspensions used. Preliminary multilayer coating results which focus on large-scale uniformity and LDT are presented.

19151 (UCRL-JC–110158) **Active modelocking and phase stabilization of a cavity dumped diode pumped Nd:YAG mini-laser.** Ruggiero, A.J. Lawrence Livermore National Lab., CA (United States). Mar 1992. 6p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-920573–7: CLEO/QELS '92, Anaheim, CA (United States), 10-17 May 1992). Order Number DE92011946. Source: OSTI; NTIS; GPO Dep.

The design and operation of a variable repetition rate, acousto-optically cavity dumped, actively modelocked and phase stabilized diode pumped Nd:YAG mini-laser is reported. Use of a piezoelectrically induced strain optic (PESO) loss modulator for modelocking results in stable 20psec pulses at 1064nm over a range of repetition rates from single shot to the 100MHz oscillator frequency.

19152 (VTT-TIED–1167) **Computer aided failure mode and effect analysis.** Lehtelae, M. (Technical Research Centre of Finland, Espoo (Finland). Safety Engineering Lab.); Kuhakoski, K. Technical Research Centre of Finland, Espoo (Finland). Sep 1990. 37p. (In Finnish). Order Number DE92506485. Source: OSTI; NTIS (US Sales Only).

The aim of this study was to create a program with which the failure mode and effect analysis (FMEA) of analog electronic circuits can be made as automatically as possible. The study of computer aided FMEA was based on the fact that there is no suitable program for this purpose in the market, and that the manual performance of FMEA is usually arduous. This report includes information about the structure, memory control, interface and other characteristics of the program as well as the theoretical methods used in programming. The FMEA, the characteristics, and use of the program in general are illustrated also by examples. Finally, the program and the future needs of developing it are evaluated. The analog circuits that include the most usual electronic components can be evaluated in their normal and failure form at DC, AC or transient level. The FMEA can be performed automatically or interactively, and the program always gives the node voltages as a result of the simulation. The selection of components and analyses in this program is not as versatile as in many commercial circuit simulation programs, but on the other hand, the structure of the program makes it possible to extend the characteristics for future requirements.

19153 (AECL–10337) **Progress report - physical sciences TASCC division 1990 July 01 - December 31.** Atomic Energy of Canada Ltd., Chalk River, ON (Canada). Chalk River Nuclear Labs. May 1991. 142p. (PR-TASCC–1.). Order Number DE92626802. Source: OSTI; NTIS (US Sales Only); INIS.

A completely new administrative structure of AECL Research was implemented on 1990 July 1. All of the basic physics programs, together with accelerator physics, radiation applications and most of the chemistry programs of AECL, have been placed in a new organizational unit called Physical Sciences. This unit also includes the management of the National Fusion Program. The research programs of Physical Sciences are grouped into three divisions: Chemistry, Physics and TASCC. Progress in each division will henceforth be reported on a twice-yearly basis. This report is the first of the new series to be issued by the TASCC Division. During the period covered by this report, the operation of the superconducting cyclotron has matured considerably, with over 30 accelerated ion beams more-or-less routinely available for a wide variety of nuclear physics experiments. The TASCC team, together with all the engineers, trades-people and other staff members who contributed to the design, constructed and commissioning of the Tandem Accelerator Superconducting Cyclotron facility, are to be heartily congratulated on bringing it to its present highly successful state in an unusually short period of time. In conjunction with our many outside collaborators, we are now engaged on exciting experiments in several areas of nuclear physics research, as reported in the following pages. We are well on the way to the establishment of a truly National Centre for Nuclear Physics research in Canada.

19154 (AECL–10431) **Progress report - physical sciences TASCC division 1991 January 01 - June 30.** Hardy, J.C. (ed.). Atomic Energy of Canada Ltd., Chalk River, ON (Canada). Chalk River Nuclear Labs. Sep 1991. 104p. (PR-TASCC–2.). Order Number DE92626803. Source: OSTI; NTIS (US Sales Only); INIS.

This is the second in a new series of reports of the work of the TASCC Division since the creation of the Physical Sciences Unit in 1990. Physical Sciences comprises four main sectors, namely the TASCC, Physics and Chemistry Divisions, and the National Fusion Program Management Office. Physics Division is responsible for research and development in the areas of condensed matter physics, neutron and neutrino physics, and accelerator physics, while TASCC Division deals with research performed with the Tandem and Superconducting Cyclotron accelerators, primarily in the field of Heavy Ion Nuclear Physics.

19155 (DOE/EH–0226P) **Organizational cultural survey of the Stanford Linear Accelerator Center.** USDOE, Washington, DC (United States). Nov 1991. 60p. Sponsored by USDOE, Washington, DC (United States). Order Number DE92012436. Source: OSTI; NTIS; GPO Dep.

At the request of the Department of Energy, an Organizational Survey (OS) was administered at the Stanford Accelerator Center (SLAC). The OS measured employees' opinions on subjects such as organizational culture, communication, commitment, group cohesion, coordination, safety, environmental issues, and job satisfaction. The result of this work was a quantitative measure of the notion of culture at the SLAC site. This report presents these results and discusses their interpretation.

19156 (JINR-D–9-89-52(v.2)) **Proceedings of 11. All-Union conference on charged particles accelerators. V. 2.** Vasil'ev, A.A. AN SSSR, Moscow (USSR). Fizicheskij Inst.; Gosudarstvennyj Komitet po Ispol'zovaniyu Atomnoj Ehnergii SSSR, Moscow (USSR); Joint Inst. for Nuclear Research, Dubna (USSR). 1989.

Individual papers in these proceedings are indexed.

19157 (RAL–89-050) **ISIS annual report for the financial year 1 April 1988 to 31 March 1989.** Rutherford Appleton Lab., Chilton (United Kingdom). Jul 1989. 301p. Order Number DE92626804. Source: OSTI; NTIS (US Sales Only); INIS.

Over the past year, to 31st March 1989, ISIS has not only maintained its position as the world's most powerful pulsed neutron - and muon -source, but has made further notable strides forward. The operating current has increased, reliability has improved significantly, new instruments have come into operation, and new science has underlined yet again the major advantages of pulsed spallation sources. A new management structure was put in place during the year, and several bilateral agreements were finalised. (author).

19158 (RAL–90-050) **ISIS annual report for the financial year 1 April 1989 to 31 March 1990.** Rutherford Appleton Lab., Chilton (United Kingdom). Jul 1990. 380p. Order Number DE92626805. Source: OSTI; NTIS (US Sales Only); INIS.

The year 1989/1990 has been another year of significant achievements at the ISIS Facility at Rutherford Appleton Laboratory - still the world's most powerful pulsed neutron and muon source. New records of current and reliability have been established by the accelerator and the instrument suite continues to expand. Demand for both neutron and muon time remains high and the quality and breadth of the scientific programme is evident in this, our fifth, Annual Report. The accelerator continues to improve, with proton currents in excess of 100 μA averaged over a week and the daily average record now standing at 107 μA. A significant injection of funds will come through Germany's KfK to enhance the performance of the accelerator over a three year period. This will lead to improvements in reliability and current which will benefit all users of the Facility. A major advance this year has been the commissioning of two new instruments - the joint United Kingdom-Japanese spectrometer MARI and the liquids diffractometer SANDALS. (author).

19159 (ANL/APS/IN/VIB–89/1) **Dynamic analysis of the 7-GeV APS experiment hall foundation based on equivalent lumped parameter modeling.** Wambsganss, M.W. Argonne National Lab., IL (United States). 25 Jan 1989. 45p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38. Order Number DE92012175. Source: OSTI; NTIS; INIS; GPO Dep.

In this technical note, mass-spring-dashpot, also referred to as equivalent lumped parameter, models are employed to model the soil-foundation interaction of two typical floor segments from the 7-GeV APS experiment hall. Equivalent lumped parameter models have the advantage of being easy to apply and of readily allowing for parameter studies. Analysis requires knowledge of certain properties of the soil including density, shear wave velocity, and Poisson's ratio, as well as knowledge of the degree of homogeneity of the underlying soil stratum. These data for the APS site were determined by a geotechnical investigation. A soil profile and pertinent data, obtained from crosshole seismic testing, are given. Natural frequencies and damping are calculated for the vertical, sliding, rocking, and coupled rocking/sliding modes of vibration. Subsequently, various corrections to account for modeling "deficiencies" are considered and their influences evaluated. The equivalent lumped parameter models were developed for machine foundations which, compared with the APS foundation, are smaller in plan dimension. Therefore, the applicability of these models in the analysis of the dynamic characteristics of the APS foundation must be established. The modeling is evaluated by applying the equivalent lumped parameter models in the analysis of large foundations for which test data exists. A comparison of theoretical and test results establishes the basis for an assessment of the applicability and accuracy of the modeling.

19160 (ANL/APS/IN/VIB–90/1) **Surveillance of 18 Hz and 60 Hz components of ground motion at the APS site.** Jendrzejczyk, J.A.; Wambsganss, M.W.; Smith, R.K. Argonne National Lab., IL (United States). 1 Mar 1990. 15p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38. Order Number DE92012173. Source: OSTI; NTIS; INIS; GPO Dep.

The objectives of this study are to determine the location and source of the 18- and 60-Hz vibration and to eliminate or reduce its amplitude in the APS Facility. To accomplish this it is necessary to know the time of occurrence and then, to utilize triangulation methods to identify the location of the source. It its time sequence is known, it may be possible to correlate it with the operation of some equipment at or near the site. Therefore, a major effort was made to obtain the time sequence and is the basis of this note.

19161 (CONF-9105202–, pp. 6, Paper 1) **Supercomputing activities at the SSC Laboratory, the main collider and the HEB.** Yiton Yan (Superconducting Super Collider Lab., Dallas, TX (United States)). USDOE Office of Energy Research, Washington, DC (United States). Scientific Computing Staff. [1991]. From 1. energy research power supercomputer users symposium; Gaithersburg, MD (United States); 21-22 May 1991. In *Proceedings of the first energy research power supercomputer users symposium.* 173p. Order Number DE91018877. Source: OSTI; NTIS; INIS.

Supercomputers are used to simulate and track particle motion around the collider rings and the associated energy boosters of the Superconducting Super Collider (SSC). These numerical studies will aid in determining the best design for the SSC. There are many other supercomputing activities at the SSC Laboratory, including studies of magnet design, cryogenics, and detector. Each component of the SSC complex must be designed properly to ensure successful operation. Since all of these designs involve a high degree on nonlinearity in mathematical formulation, numerical calculations are required. Actually, large-scale computer simulations are probably the only way to obtain a detailed understanding of each component of the SSC.

19162 (CONF-9105202–, pp. 8, Paper 11) **Applications of large-scale computation to particle accelerators.** Herrmannsfeldt, W.B. (Stanford Linear Accelerator Center, CA (United States)). USDOE Office of Energy Research, Washington, DC (United States). Scientific Computing Staff. [1991]. DOE Contract AC03-76SF00515. From 1. energy research power supercomputer users symposium; Gaithersburg, MD (United States); 21-22 May 1991. In *Proceedings of the first energy research power supercomputer users symposium.* 173p. Order Number DE91018877. Source: OSTI; NTIS; INIS.

The rapid growth in the power of large-scale computers has had a revolutionary effect on the study of charged-particle accelerators that is similar to the impact of smaller computers on everyday life. Before an accelerator is built, it is now the absolute rule to simulate every component and subsystem by computer to establish modes of operation and tolerances. The authors will bypass the important and fruitful areas of control and operation, and consider only application to design and diagnostic interpretation. Applications of computers can be divided into separate categories including: (1) component design; (2) system design; (3) stability studies: (4) cost optimization: (5) operating condition simulation. For the purposes of this report, he will choose a few examples from the above categories to illustrate the methods used, and discuss the significance of the work to the project. He also briefly discusses the accelerator project itself. The examples that will be discussed are: The design of accelerator structures for electron-positron linear colliders and circular colliding beam systems (B-factories). Simulation of the wake fields from multibunch electron beams for linear colliders. Particle-in-cell simulation of space-charge dominated beams for an experimental linear induction accelerator for Heavy Ion Fusion.

19163 (INIS-mf–13179, pp. 139-153) **Accelerator programme at CAT.** Ramamurthi, S.S. (Centre for Advanced Technology, Indore (India)). Department of Atomic Energy, Bombay (India). Board of Research in Nuclear Physics. 1991. 310p. (CONF-9012123–: DAE symposium on nuclear physics, Madras (India), 1-4 Dec 1990). The Accelerator Programme at the Centre for Advanced Technology (CAT), Indore, has very broad based concept under which all types of accelerators are to be taken up for design and fabrication. This centre will be housing a wide variety of accelerators to serve as a common facility for the universities, national laboratories in addition to laboratories under the Department of Atomic Energy. In the first phase of the programme, a series of electron accelerators are designed and fabricated. They are synchrotron radiation sources of 450 MeV (INDUS-I) and of 2 GeV (INDUS-II), microtron upto energy of 20 MeV, linear accelerator upto 20 MeV, and DC Accelerator for industrial irradiation upto 750 KeV and 20 KW. A proton accelerator of 300 MeV with 20 MeV linac injector is also designed. CAT is also developing a strong base for support technologies like ultra high vacuum, radio frequency and microwaves, DC pulsed and superconducting magnets, power supplies and controls etc. These technologies are very useful for other industrial applications also. To develop user groups to utilise INDUS-II synchrotron radiation source, a batch production of rotating Anode X-ray generators with power supplies has been initiated. So also, the sputter ion pumps, electron guns, turbo molecular pumps are brought into batch production. (author).

19164 (INP–1466/PS, pp. 69-71) **The COSY - Juelich project - Feb. 1989 status.** Maier, R. (Forschungszentrum Juelich GmbH (Germany)); Martin, S.; Pfister, U. Institute of Nuclear Physics, Cracow (Poland); Uniwersytet Jagiellonski, Cracow (Poland). Inst. Fizyki. 1989. (CONF-8904247–: 24. Zakopane school on physics, Zakopane (Poland), 16-30 Apr 1989). In *Proceedings of 24. Zakopane school on physics, Zakopane, Poland, 16-30 April 1989. Part 1.: Selected topics in nuclear structure: Part 1. Selected topics in nuclear structure.* 364p. Order Number DE92622580. Source: OSTI; NTIS (US Sales Only); INIS.

The layout of COSY the cooler synchrotron and storage ring at Juelich is presented. Together with the most important design considerations an overview of the actual scheme and realization status is discussed. Details on the upgrading of the injector cyclotron, the injection and the extraction beamlines are given. The machine and beam parameters are shown. (author).

19165 (INS-T–505) **The design of the new control program (CSA90) for the TARN2.** Aoki, Kenichi (Sumitomo Heavy Industries Ltd., Tokyo (Japan)); Watanabe, Shinichi. Tokyo Univ., Tanashi (Japan). Inst. for Nuclear Study. Oct 1991. 29p. (In Japanese). Order Number DE92514941. Source: OSTI; NTIS (US Sales Only); INIS.

The control program CSA90 for new control system of TARN2 is designed. In this control system, the separate units execute the man-machine communications and device control. The EXU executes the devices control, whereas OPU's or LGU's execute the man-machine communications. These units are connected via an Ethernet. The CSA90 provides a flexible and expandable control system to us. This program has a basic program, device control programs, configuration definition files and a data generator. The device control programs are a set of subroutines and they have no direct relation to each other. The basic program executes those subroutines according to a configuration program and a request from the OPU. To make the configuration file easily, a data generation program is also provided. By using CSA90, supplements of new functions or modification of the control procedures are easily made by addition or modification of the subroutines. Then the control sequence or configuration of the control system could be changed easily in according to the purpose of accelerator study and so on. In this paper, the idea and structure of the control program, CSA90, for the EXU are described. (author).

19166 (JINR–9-90-152) **JINR synchrotron. Performance and improvement (quarter 1 and 2, 1989).** Balandikov, A.N. (and others); Voevodin, M.A.; Volkov, V.I. Joint Inst. for Nuclear Research, Dubna (USSR). Lab. of High Energy. 1990. 5p. (In Russian). Order Number DE92626808. Source: OSTI; NTIS (US Sales Only); INIS.

A report on the JINR synchrotron performance in the first and second quarter of 1989 and on accomplished scientific scientific program is presented. A description of a new magnet channel on the second route on the slow beam extraction (SE-2) of nuclei with the energy up to 2.6 GeV/c is given. A scheme of establishment of local computer network of the accelerator complex and the parameters of the utilized computers are presented.

19167 (KINR–90-24) **Main parameters of the accelerator - storage ring at the Institute of Nuclear Research Ukrainian Academy of Sciences: Kiev, project.** Dolinsky, A.V.; Papash, A.I.; Pavlov, S.N.; Rudchik, A.T.; Valkov, A.E.; Vishnevsky, I.N.; Zhmendak, A.V. AN Ukrainskoj SSR, Kiev (Ukraine). Inst. Yadernykh Issledovanij. 1990. 6p. Order Number DE92626809. Source: OSTI; NTIS (US Sales Only); INIS.

The main parameters of the accelerator-storage ring and electron beam system using for cooling of the heavy ions, are described. Cyclotron U-240 serves as an injector in the ring. Parameters of injecting beam of U-240 are given. 1 refs.; 1 tab.

19168 (LBL–31243) **The Advanced Light Source at Lawrence Berkeley Laboratory.** Robinson, A.L.; Perera, R.C.C.; Schlachter, A.S. Lawrence Berkeley Lab., CA (United States). Oct 1991. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC03-76SF00098. (CONF-910730–30: 4. international conference on synchrotron radiation instrumentation, Chester (United Kingdom), 15-19 Jul 1991). Order Number DE92011728. Source: OSTI; NTIS; INIS; GPO Dep.

The Advanced Light Source (ALS) at the Lawrence Berkeley Laboratory (LBL), scheduled to be operational in the spring of 1993 as a US Department of Energy national user facility, will be a next-generation source of soft x-ray and ultraviolet (XUV) synchrotron radiation. Undulators will provide the world's brightest synchrotron radiation at photon energies from below 10 eV to above 2 keV; wiggler and bend-magnet radiation will extend the spectral coverage with high fluxes above 10 keV. These capabilities will support an extensive research program in a broad spectrum of scientific and technological areas in which XUV radiation is used to study and manipulate matter in all its varied gaseous, liquid, and solid forms. The ALS will also serve those interested in developing the fabrication technology for micro- and nanostructures, as well as characterizing them.

19169 (AECL–10364) **Useful forms of the Hamiltonian for ion-optical systems.** Davies, W.G. Atomic Energy of Canada Ltd., Chalk River, ON (Canada). Chalk River Nuclear Labs. Apr 1991. 21p. Order Number DE92626812. Source: OSTI; NTIS (US Sales Only); INIS.

The symbiosis of differential algebra and the Lie-algebraic formulation of optics provides a set of very powerful tools for analyzing and understanding the orbit dynamics of complex accelerators up to very high orders. In order to use these tools effectively it is usually necessary to express the Hamiltonian in the appropriate coordinate system. In this report, the relativistic Hamiltonian is derived in curvilinear (the fundamental coordinate system for ion-optics), Cartesian and polar coordinates, in forms suitable for solving problems in ion optics and accelerator physics both with and without the help of differential algebra.

19170 (BNL–46678) **Conversion of power and frequency.** Ruggiero, A.G.; Wei, J. Brookhaven National Lab., Upton, NY (United States). [1992]. 3p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH00016. (CONF-920315–33: 3. European particle accelerator conference, Berlin (Germany), 24-28 Mar 1992). Order Number DE92012543. Source: OSTI; NTIS; INIS; GPO Dep.

This paper deals with a novel idea to excite electrons to radiate energy in the short (millimeter) wavelength range. A short electron bunch is made to travel along the axis of a waveguide where a TM electromagnetic wave is also traveling and causes the beam to perform transverse oscillations. The electrons radiate energy as a consequence of the oscillations. It is found that a convenient mode of operation is to drive the waveguide in proximity of the cut-off.

19171 (BNL–46683) **Transition crossing in the RHIC.** Wei, Jie. Brookhaven National Lab., Upton, NY (United States). [1992]. 3p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH00016. (CONF-920315–30: 3. European particle accelerator conference, Berlin (Germany), 24-28 Mar 1992). Order Number DE92013031. Source: OSTI; NTIS; INIS; GPO Dep.

This report summarizes the study of various longitudinal problems pertaining to the transition-energy crossing in the proposed Relativistic Heavy Ion Collider. Scaling laws are provided for the effects of chromatic non-linearity, self-field mismatch, and microwave instability. It is indicated that the beam loss and bunch-area growth are mainly caused by the chromatic non-linear effort, which is enhanced by the space-charge force near transition. Computer simulation using the program. TIBETAN shows that a "γT-jump" of about 0.8 unit within a time period of 60 ms is adequate to achieve a "clean" crossing, provided that the remnant voltage of the 160 MHz rf system is less than 10 kV.

19172 (BNL–46684) **Stochastic cooling with a double rf system.** Wei, Jie. Brookhaven National Lab., Upton, NY (United States). [1992]. 3p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH00016. (CONF-920315–29: 3. European particle accelerator conference, Berlin (Germany), 24-28 Mar 1992). Order Number DE92013032. Source: OSTI; NTIS; INIS; GPO Dep.

Stochastic cooling for a bunched beam of hadrons stored in an accelerator with a double rf system of two different frequencies has been investigated. The double rf system broadens the spread in synchrotron-oscillation frequency of the particles when they mostly oscillate near the center of the rf bucket. Compared with the ease of a single rf system, the reduction rates of the bunch dimensions are significantly increased. When the rf voltage is raised, the reduction rate, instead of decreasing linearly, now is independent of the ratio of the bunch area to the bucket area. On the other hand, the spread in synchrotron-oscillation frequency becomes small with the double rf system, if the longitudinal oscillation amplitudes of the particles are comparable to the dimension of the rf bucket. Consequently, stochastic cooling is less effective when the bunch area is close to the bucket area.

19173 (BNL–46685) **Theory of the tune shift due to linear coupling.** Parzen, G. Brookhaven National Lab., Upton, NY (United States). [1992]. 3p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH00016. (CONF-920407–2: 3. European particle accelerator conference, Berlin (Germany), 7-11 Apr 1992). Order Number DE92013033. Source: OSTI; NTIS; INIS; GPO Dep.

This paper presents analytical perturbation theory results for ν_1, ν_2, the tune in tune presence of linear coupling.

19174 (BNL–46686) **Theory of the beta function shift due to linear coupling.** Parzen, G. Brookhaven National Lab., Upton, NY (United States). [1992]. 3p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH00016. (CONF-920407–1: 3. European particle accelerator conference, Berlin (Germany), 7-11 Apr 1992). Order Number DE92013034. Source: OSTI; NTIS; INIS; GPO Dep.

This paper presents analytical perturbation theory results for β_1, β_2, the beta functions in the presence of linear coupling.

19175 (BNL–46687) **Study on a longitudinal damper system.** Xu, Jianming. Brookhaven National Lab., Upton, NY (United States). [1992]. 3p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH00016. (CONF-920315–21: 3. European particle accelerator conference, Berlin (Germany), 24-28 Mar 1992). Order Number DE92012209. Source: OSTI; NTIS; INIS; GPO Dep.

19176 (BNL–47378) **Longitudinal bunch profile measurements with striplines.** Kramer, S.L. Brookhaven National Lab., Upton, NY (United States). [1992]. 3p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH00016. (CONF-920315–28: 3. European particle accelerator conference, Berlin (Germany), 24-28 Mar 1992). Order Number DE92013035. Source: OSTI; NTIS; INIS; GPO Dep.

Striplines beam position monitors are normally considered low frequency devices with at best an octave bandwidth. Some attempts to make them very high frequency and broadband have led to long and complicated tapered construction. However, conventional uniform coupling striplines can provide very high frequency and broadband response, if the downstream induced signal is gated out electronically. In this case, the leading edge beam signal can provide bunch length and even current profile information for bunch lengths shorter than the length of the stripline. Recent improvement in transient digitizers have made these measurements possible for accelerator operations. Measurements of bunch lengths down to 50 psec are results are presented. Improvements to striplines and measurement systems are discussed, that could lead to bunch length resolutions $\approx$ 10 psec.

19177 (DOE/ER/40625–T1) **Dissemination and support of ARGUS for accelerator applications: Technical progress report, April 24, 1991–January 20, 1992.** Science Applications International Corp., McLean, VA (United States). 20 Jan 1992. 18p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-91ER40625. Order Number DE92013726. Source: OSTI; NTIS; INIS; GPO Dep.

The ARGUS code is a three-dimensional code system for simulating for interactions between charged particles, electric and magnetic fields, and complex structure. It is a system of modules that share common utilities for grid and structure input, data handling, memory management, diagnostics, and other specialized functions. The code includes the fields due to the space charge and current density of the particles to achieve a self-consistent treatment of the particle dynamics. The physic modules in ARGUS include three-dimensional field solvers for electrostatics and electromagnetics, a three-dimensional electromagnetic frequency-domain module, a full particle-in-cell (PIC) simulation module, and a steady-state PIC model. These are described in the Appendix to this report. This project has a primary mission of developing the capabilities of ARGUS in accelerator modeling of release to the accelerator design community. Five major activities are being pursued in parallel during the first year of the project. To improve the code and/or add new modules that provide capabilities needed for accelerator design. To produce a User's Guide that documents the use of the code for all users. To release the code and the User's Guide to accelerator laboratories for their own use, and to obtain feed-back from the. To build an interactive user interface for setting up ARGUS calculations. To explore the use of ARGUS on high-power workstation platforms.

19178 (JINR-E–9-90-92) **Theory of accelerated orbits in AVF cyclotrons.** Tsenov, S.I. Joint Inst. for Nuclear Research, Dubna (USSR). Lab. of Nuclear Reactions. 1990. 16p. Order Number DE92626813. Source: OSTI; NTIS (US Sales Only); INIS.

The theory of accelerated orbits in AVF cyclotons through a fully six-dimensional hamiltonians formalism is developed. The design orbit of a particle, the betatron motion and the phase motion are calculated in linear approximation. The 'quasi-equilibrium orbit' and dispersion are studied in the framework of the Hamiltonian formalism. 8 refs.

19179 (JINR-R–9-90-65) **Some causes of electron-beam losses in a linear induction accelerator channel.** Rakityanskij, S.A. Joint Inst. for Nuclear Research, Dubna (USSR). Lab. of Nuclear Problems. 1990. 9p. (In Russian). Order Number DE92626814. Source: OSTI; NTIS (US Sales Only); INIS.

With the use of numerical simulation of the lateral coherent beam oscillations it is explored an influence of different axial summary breaking factors upon the channel transparency. Necessity of combination of the surfaces producing electric and magnetic beam images is established. To accuracy of the symmetry keeping there are formulated the indispensable requirements caused by the coherent oscillation development and the correspondent loss of accelerated particles. 5 refs.

19180 (KEK–91-9) **Single bunch beam breakup in linacs and BNS damping.** Toyomasu, Takanori (The Graduate Univ. for

Advanced Studies, Tsukuba, Ibaraki (Japan)). National Lab. for High Energy Physics, Tsukuba, Ibaraki (Japan). Dec 1991. 37p. Order Number DE92514987. Source: OSTI; NTIS (US Sales Only); INIS.

We study a single-bunch beam breakup (BBU) problem by a macro-particle model. We consider both the BBU solution and the Landau damping solution which includes the Balakin-Novokhatsky-Smirnov (BNS) damping. In the BBU solution, we get an analytic solution which includes both the Chao-Richter-Yao solution and the two-particle model solution and which agrees well with simulation. The solution can also be used in a multi-bunch case. In the Landau damping solution, we can be see the mechanism of Landau damping formally and can get some insights into BNS damping. We confirm that a two-particle model criterion for BNS damping is a good one. We expect that the two-particle model criterion is represented by the first order interaction in Landau damping solution of a macro-particle model. (author).

19181 (SAND–91-2285C) **A momentum limit for electromagnetic railguns.** Cowan, M. Sandia National Labs., Albuquerque, NM (United States). [1991]. 6p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-76DP00789. (CONF-9204102–6: 6. symposium on electromagnetic launch technology, Austin, TX (United States), 28-30 Apr 1992). Order Number DE92011380. Source: OSTI; NTIS; GPO Dep.

We postulate that there is a required velocity of magnetic flux into a plasma-armature railgun to keep the armature from expanding toward the breech and thereby changing the nature of the forward-going force. Testing this idea with data from several guns we find confirmation, provided the required flux velocity increases with the square of the linear current density. This leads to the conclusion that these guns have a momentum limit while they are operating as true electromagnetic launchers. That limit is derived. High-performance railguns reach this limit during current rise, and most of their momentum comes from a hybrid phase. The hybrid phase has a pressure limitation at high velocity similar to electrothermal, light-gas, and powder guns. The 6 km/s "velocity limit" is explained by this pressure limitation.

19182 (SLAC-PUB–5747) **Measured emittance versus store time in the SLC damping ring.** Decker, F.J.; Emma, P.; Krejcik, P.; Limberg, T.; Minty, M.; Moshammer, H.; Raubenheimer, T.; Ross, M.; Seeman, J.T.; Siemann, R.; Spence, W.; Spencer, J.; Woodley, M. Stanford Linear Accelerator Center, Menlo Park, CA (United States). Mar 1992. 3p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC03-76SF00515. (CONF-920315–22: 3. European particle accelerator conference, Berlin (Germany), 24-28 Mar 1992). Order Number DE92012416. Source: OSTI; NTIS; INIS; GPO Dep.

Emittance studies at the SLC North Damping Ring led to precise measurements of the damping time using three independent methods. These measurements were done at three different locations: (1) in the ring using a fast gated video camera which allows the acquisition of the image of the synchrotron light from a single turn, (2) using the extracted beam and a single wire scanner in the ring-to-linac transport line, and (3) in the linac using four wire scanners. In addition the extracted beam emittance was studied as a function of various parameters. A significant dependence on the tune was observed.

19183 (SLAC-PUB–5766) **The coupled dipole modes of the NLC accelerator structure.** Bane, K.L.F.; Gluckstern, R.; Holtkamp, N. Stanford Linear Accelerator Center, Menlo Park, CA (United States). Mar 1992. 3p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC03-76SF00515. (CONF-920315–12: 3. European particle accelerator conference, Berlin (Germany), 24-28 Mar 1992). Order Number DE92011584. Source: OSTI; NTIS; INIS; GPO Dep.

The proposed accelerator cavity of the Next Linear Collider (NLC) is a disk-loaded structure composed of 200 cells, operating at 11.42 GHz. The proposed mode of operation is to accelerate bunches in trains of 10, with a bunch spacing of 42 cm. One problem is that one bunch in a train can excite transverse wakefields in the accelerator cavity which, in turn, can deflect following bunches and result in emittance growth. A method of curing this problem is to detune the transverse modes of the cavity. Beam dynamics simulations for the NLC have shown that by keeping the transverse wakefield at the positions of the nine trailing bunches at or below 1 MW/nC/m^2 we can void emittance growth. Earlier, approximate calculations of the wakefields, which did not include the cell-to-cell coupling of the modes, have shown that by the proper Gaussian detuning the above level of cancellation can be achieved. A specific goal of this report is to see if this conclusion still holds when coupling is included in the calculation. Note that in this paper we focus on the modes belonging to the first dipole passband, which are the most important. A special feature of these modes in the detuned NLC cavity is that the cell-to-cell coupling changes sign somewhere in the middle of the structure.

19184 (SLAC-PUB–5781) **SSC beam dynamics scaled to the Eloisatron.** Ritson, D. (Stanford Linear Accelerator Center, Menlo Park, CA (United States)). Stanford Linear Accelerator Center, Menlo Park, CA (United States). Mar 1992. 3p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC03-76SF00515. (CONF-9111208–1: 19. INFN eloisation project: maximizing luminosity of hadron colliders at 100 TeV, Erice (Italy), 13-19 Nov 1991; SSCL-Preprint–85). Order Number DE92011585. Source: OSTI; NTIS; INIS; GPO Dep.

As crosssections drop as E^{-2} a desirable target for a 100 TeV the Eloisatron would be to achieve luminosities $\sim 1.10^{35}$ cm^2/sec. To understand the impact of such an objective we have compared parameters for the SSC and Eloisatron to differentiate areas which involve considerable extrapolations from current technologies from those which represent more conventional scale-ups. Synchrotron radiation losses per m for the same guide magnetic field associated with such luminosities would be up by $E^2 \times I$ where E is the energy and I is the circulating current. This would result in energy densities of ~250 times the nominal SSC values. The SSC is already limited by installed refrigeration power and if the circulating current was to be increased would have to use liners at liquid nitrogen temperatures to intercept the radiation as is proposed for the LHC. This issue was the subject of lively discussion at the workshop and is dealt with elsewhere by other authors. This author believed that the radiation could be intercepted by room temperature catchers spaced every 15–25 m around the ring. To obtain the requisite luminosities it assumes similar bunch spacing but circulating currents an order of magnitude larger than at the SSC. The SSC already uses a bunch spacing as small as 5 m and further reduction does not appear easy. The justification for the choice of bore for the magnets, emittances and attainable luminosities are discussed below. A further section looks into whether seismic ground disturbances might cause unacceptable emittance growth. The conclusion of this section is that careful use of current design practices should be adequate and that it is unlikely that exotic vibration free mounts will be required.

19185 (SLAC-PUB–5784) **Transverse wakefields at high dispersion.** Decker, F.J. Stanford Linear Accelerator Center, Menlo Park, CA (United States). Mar 1992. 4p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC03-76SF00515. (CONF-920315–4: 3. European particle accelerator conference, Berlin (Germany), 24-28 Mar 1992). Order Number DE92010752. Source: OSTI; NTIS; INIS; GPO Dep.

In high energy linear colliders the transverse beam emittance has to be preserved in order to achieve small interaction spots. If the beam is off-center in an accelerating cavity, it excites transverse wakefields, mainly the dipole mode, which deflects the tail of the beam leading to an emittance growth. In a high dispersive region, even a well centered beam can excite wakefields of higher order modes since the energy spread of the beam causes a transverse beam size which is comparable with the beam pipe. During the bunch length compression in the ring-to-linac (RTL) section of the Stanford Linear Collider (SLC), the beam pipe of 75 mm diameter is practically filled in the horizontal plane. Especially, if beam losses start to be involved, the very outer parts of the beam excite wakefields at any pipe irregularities like bellows, diameter steps, etc. Measured evidences, theoretical estimates and comparisons to other effects, like higher order magnet optics, are presented.

19186 (SLAC-PUB–5789) **Calculations of emittance and damping time effects in the SLC damping rings.** Limberg, T.;

Moshammer, H.; Raubenheimer, T.; Spencer, J.; Siemann, R. Stanford Linear Accelerator Center, Menlo Park, CA (United States). Mar 1992. 3p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC03-76SF00515. (CONF-920315–24: 3. European particle accelerator conference, Berlin (Germany), 24-28 Mar 1992). Order Number DE92012420. Source: OSTI; NTIS; INIS; GPO Dep.

In a recent NDR machine experiment the transverse emittance was studied as a function of store time and tune. To explain the observed transverse emittance damping time constants, the magnetic measurement data of the longitudinal field of the bending magnets had to be taken into account. The variation of the transverse emittances with tune due to misalignments and the associated anomalous dispersion is studied as well as the effect of synchrobetatron coupling due to dispersion in the RF cavities.

19187 (SLAC-PUB–5804) **A technique for aligning sextupole systems using beam optics.** Chao, Yu-Chiu. Stanford Linear Accelerator Center, Menlo Park, CA (United States). Mar 1992. 3p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC03-76SF00515. (CONF-920315–27: 3. European particle accelerator conference, Berlin (Germany), 24-28 Mar 1992). Order Number DE92012424. Source: OSTI; NTIS; INIS; GPO Dep.

A technique for beam based alignment of sextupole system is developed exploiting the enhancement effect of orbit differences by the sextupoles. This technique can in principle be applied to sextupole or sextupole strings with controlled orbit pattern and BPM configurations. This paper will discuss the theoretical basis, special optimization considerations and expected accuracy. Application to the SLC final focus is also discussed.

19188 (SSCL–530) **The physical solution to the Lorentz-Dirac equations in a constant magnetic field.** Endres, D. (New Mexico Univ., Albuquerque, NM (United States). Dept. of Mathematics and Statistics). Superconducting Super Collider Lab., Dallas, TX (United States). Mar 1992. 20p. Sponsored by USDOE, Washington, DC (United States); National Science Foundation, Washington, DC (United States). DOE Contract AC35-89ER40486. Grant DMR-8704348. Order Number DE92013299. Source: OSTI; NTIS; INIS; GPO Dep.

The somewhat controversial Lorentz-Dirac equations for the motion of a radiating relativistic electron are shown to admit a unique physical solution in a constant uniform magnetic field perpendicular to the particle motion. In particular, the stable manifold of the origin in a four-dimensional velocity-acceleration phase space is shown to be globally the graph of a function mapping velocity to acceleration; solutions not in this manifold are shown to exhibit unphysical accelerations. Consequently, to each velocity there corresponds a unique physical acceleration determined by the stable manifold.

19189 (SSCL–570) **6-D phase space tracking with acceleration: Modeling low energy proton synchrotrons (I).** Machida, S. Superconducting Super Collider Lab., Dallas, TX (United States). Mar 1992. 19p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC35-89ER40486. Order Number DE92013744. Source: OSTI; NTIS; INIS; GPO Dep.

Booster synchrotrons for high energy colliders and small proton synchrotrons mostly operate within the "low-energy" range from few 10 MeV up to about 10 GeV. A simulation code of both single- and multi-particle tracking has been developed especially for such machines. For the first time this code allows investigation of beam dynamics issues such as: (1) acceleration and synchrotron oscillations in fully 6-D phase space (2) transverse and longitudinal space-charge effects in 3-D real space, and (3) capture and bunching at injection and transition crossing with harmonic rf cavities. This paper describes the single-particle part of the code and presents some results on the Low Energy Booster (LEB) of the Superconducting Super Collider (SSC).

19190 (SSCL-Preprint–72) **A general control model for designing beam control feedback loops.** Mestha, L.K. (Superconducting Super Collider Lab., Dallas, TX (United States)); Webber, R.C.; Kwan, C.M. Superconducting Super Collider Lab., Dallas, TX (United States). Mar 1992. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC35-89ER40486. (CONF-920315–19: 3. European particle accelerator conference, Berlin (Germany), 24-28 Mar 1992). Order Number DE92011696. Source: OSTI; NTIS; INIS; GPO Dep.

To control the beam in the synchrotron there may be six different primary feedback loops interacting with the beam at a given time. Three loops are local to the rf cavity. They are: high bandwidth cavity phase and amplitude loops used to minimize the effects due to beam loading and a low bandwidth cavity tuning loop. The loops global to the ring accelerating system are: a radial loop to keep the beam on orbit, a beam phase loop to damp the dipole synchrotron oscillations, and a synchronization loop to essentially lock with the succeeding machine. There are various ways in which these loops may be designed. Designs currently in use in operating machines are based on classical frequency domain techniques. To apply modern feedback controllers and study the interaction of all the feedback loops, a good mathematical model of the beam is extremely useful. In this paper we show the derivation of a non-linear tracking model in terms of differential equations obtained from a set of time varying finite difference equations. The model compares well with the results of thin element tracking codes.

19191 (ANL/APS/IN/VIB–89/2) **Preliminary vibration analysis of magnet/support system for 7-GeV APS storage ring.** Wambsganss, M.W. Argonne National Lab., IL (United States). 8 May 1989. 10p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38. Order Number DE92012379. Source: OSTI; NTIS; INIS; GPO Dep.

The storage ring quadrupoles, sextupoles, and correction magnets will be mounted on a common girder approximately 4.0 m long. The rigid girder, in turn, is mounted on three five-ton jacks, each of which is mounted on a pedestal that is grouted and bolted to the floor. For this preliminary analysis, we will assume that the girder has a weight per unit length of 100 lb/ft and a bending stiffness that is significantly greater than the vertical stiffness provided by the pedestal (jack-screw) supports. This allows us to approximate the magnet/support system as a rigid beam (girder) on spring supports (jack-screws) carrying distributed masses (magnets). These approximations permit us to study the rigid body translational and rotational (rocking) modes of the system. It should be noted that the preliminary design has two jack-screw supports at the left end and one at the right end. It should be noted that the magnet/support system studied is only a conceptual design. In actuality, there are five different magnet/support configurations comprising each of the 40 sectors of the storage ring. Also, it is expected that the details of the final design, in particular with respect to the positioning of the pedestal supports, will somewhat different. It should further be noted that a major assumption in the analysis is that the stiffness of the support beam with respect to the stiffness of the jack-screw supports is such that the support girder can be assumed rigid. To evaluate this assumption it is planned to perform a finite element analysis of the magnet/support system in which the flexibility of the support girder is included in the dynamic analysis.

19192 (ANL/APS/IN/VIB–89/3) **Vibration analysis of APS magnet/support systems based on the finite element method.** Chen, S.S.; Wambsganss, M.W. Argonne National Lab., IL (United States). 6 Mar 1989. 21p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38. Order Number DE92012174. Source: OSTI; NTIS; INIS; GPO Dep.

Prediction of the dynamic response of APS magnet/support systems requires knowledge of the free vibrational characteristics, including natural frequencies, modes, and modal damping ratios. A preliminary dynamic analysis of the magnet/support system of a typical section of the APS storage ring, as presented in the APS Conceptual Design Report, was performed to gain insight. The preliminary analysis is based on the assumption that the support girder could be considered rigid relative to the stiffness of the pedestal supports when considering the lower modes and frequencies. Further, only the vertical (in-plane) translational and rocking modes were studied. The subject analysis was performed to include the flexibility of the support girder and to investigate the horizontal (out-of-plane) modes as well. Also, the most up-to-date design of the five magnet sections are studied. Here, it should be noted that in the latest design the positioning of the support pedestals (jackscrews) is different from that in the conceptual design.

19193 (ANL/APS/IN/VIB–90/3) **Vibration study of the APS magnet support assemblies.** Wambsganss, M.W.; Jendrzejczyk, J.A.; Chen, S.S. Argonne National Lab., IL (United States). Nov 1990. 70p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38. Order Number DE92013068. Source: OSTI; NTIS; INIS; GPO Dep.

Stability of the positron closed orbit is a requirement for successful operation of the Advanced Photon Source. The fact that vibration of the storage ring quadrupole magnets can lead to distortion of the positron closed orbit and to potentially unacceptable beam emittance growth provides the motivation for the subject studies. Low frequency vibrations can be controlled with steering magnets using feedback systems, provided the vibration amplitudes are within the dynamic range of the controllers. High frequency vibration amplitudes, on the other hand, are out of the range of the controller and, therefore must be limited to ensure the emittance growth will not exceed a prescribed value. Vibration criteria were developed based on the requirement that emittance growth be limited to 10 percent. Recognizing that the quadrupole magnets have the most significant effect, three different scenarios were considered: vibration of a single quadrupole within the storage ring, random vibration of all the quadrupoles in the ring, and the hypothetical case of a plane wave sweeping across the site and the quadrupoles following the motion of the plane wave. The maximum allowable peak vibration amplitudes corresponding to these three vibration scenarios are given. The criteria associated with the passage of a plane wave is dependent on wavelength, or, alternatively, on frequency given the wave speed. The wave speed used is that measured as a part of the geotechnical investigation at the APS site.

19194 (ANL/APS/IN/VIB–91/1) **Vibration study of the APS storage ring vacuum-chamber/girder assembly.** Jendrzejczyk, J.A.; Wambsganss, M.W.; Smith, R.K. Argonne National Lab., IL (United States). Feb 1991. 73p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38. Order Number DE92012178. Source: OSTI; NTIS; INIS; GPO Dep.

The overall objective of this study is to obtain insights into the dynamic coupling between the storage ring vacuum chamber and girder, and an assessment of the potential for unacceptable vibration amplitudes that would require redesign of the vacuum chamber supports. Specific objectives include determination of the vibrational characteristics (natural frequencies and modes) of the coupled vacuum-chamber/girder system, measurement of response amplitudes to forced excitation and ambient floor motion, and calculation of magnification factors associated with the various coupled vibration modes. 1 ref.

19195 (ANL/APS/IN/VIB–91/2) **Vibration study of the APS storage ring 0.8 meter quadrupole/girder assembly.** Jendrzejczyk, J.A.; Wambsganss, M.W.; Smith, R.K. Argonne National Lab., IL (United States). May 1991. 99p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38. Order Number DE92012172. Source: OSTI; NTIS; GPO Dep.

The overall objective of this study is to obtain insights into the dynamic coupled behavior of the quadrupole magnet and the girder assembly, and an assessment of the potential for unacceptable vibration levels which would require redesign of the quadrupole and/or girder mounting system(s). Specific objectives include determination of vibrational characteristics (natural frequencies, damping, mode shapes, and transfer functions) of the coupled magnet/girder system, measurement of response amplitudes of forced excitation and ambient floor motion, and calculation of magnification factors associated with the observed coupled vibration modes. In the Phase 1 tests the 0.8 meter quadrupole was mounted to the girder with a prototypic mount and excitation was primarily by an electromagnetic exciter or the result of ambient floor motion, with the exception of Test 7, which was impulse excited. In the Phase 2 tests the excitation was primarily by impulse with only a few tests with ambient floor excitation. A strong, coupled magnet/girder mode response occurs at frequency of 7.62 Hz resulting in very large magnification factors (low damping values) and large displacements. It appears that a low frequency rigid body mode of the magnet coincides with a girder mode frequency. The Phase 2 tests show the effect of jackscrew conditions on system response. When the pedestal bolts were loose, the jackscrew/pedestal assembly deflected slightly from its initial vertical position, resulting in a shift in position of the jackshaft within the screw assembly. The result was a significant reduction of frequency and a large increase in damping.

19196 (ANL/APS/IN/VIB–91/3) **Vibration study of the APS storage ring 0.8 meter quadrupole magnet/magnet support assembly.** Jendrzejczyk, J.A.; Wambsganss, M.W.; Smith, R.K. Argonne National Lab., IL (United States). Jun 1991. 73p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38. Order Number DE92012177. Source: OSTI; NTIS; INIS; GPO Dep.

The objectives of this study are as follows: Determine the vibration characteristics (frequency, damping, and mode shapes) of the magnet on prototypic supports (the actual mounting system used to mount the magnet on the girder). Measure system response to ambient floor motion. Measure the effect of various modifications to determine if the magnet response can be modified to minimize unwanted response characteristics. Modifications investigated include support schemes, increasing system damping, and increasing mechanical rigidity. Measure system response to coolant flow. Determine vibrational characteristics of a large concrete block placed on a concrete floor, including response to ambient floor motions.

19197 (ANL/CP–75862) **Aperture coupling measurement in a test chamber for the Advanced Photon Source (APS).** Song, J.J.; Zhou, J.H.; Kustom, R.L. Argonne National Lab., IL (United States). [1992]. 3p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38. (CONF-920315–32: 3. European particle accelerator conference, Berlin (Germany), 24-28 Mar 1992). Order Number DE92013059. Source: OSTI; NTIS; INIS; GPO Dep.

Aperture coupling measurements have been made using two identical rectangular chambers. A common wall between them has holes of various size, thickness, shape and number. The transverse electromagnetic (TEM) wave, which propagates in one rectangular chamber, couples through the aperture and radiates into the other chamber. The measured results are compared with the diffraction model and used to estimate the coupling impedance of a circulating beam. The results of these measurements was applied to the detailed design of some of the vacuum components in the Advanced Photon Source.

19198 (BNL–46332) **Design of a high-brightness, high-duty factor photocathode electron gun.** Lehrman, I.S. (Grumman Corp., Princeton, NJ (United States)); Birnbaum, I.A.; Fixler, S.Z.; Heuer, R.L.; Siddiqi, S.; Sheedy, E.; Ben-Zvi, I.; Batchelor, K.; Gallardo, J.C.; Kirk, H.G.; Srinivasan-Rao, T.; Warren, G.D. Brookhaven National Lab., Upton, NY (United States). Sep 1991. 19p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH00016. (CONF-9108118–47: 13. international free-electron laser (FEL) conference, Santa Fe, NM (United States), 25-30 Aug 1991). Order Number DE92011003. Source: OSTI; NTIS; INIS; GPO Dep.

The proposed UV-FEL user's facility at Brookhaven National Laboratory will require a photocathode gun capable of producing short (< 6 psec) bunches of electrons in high repetition rates (5 kHz), low energy spread (< 1.5.%), a peak current of 300 A (after compression) and a total bunch charge of up to 2 nC. At the highest charge the normalized transverse emittance should be less than 7 π mm-mrad. We are presently designing a gun that is expected to exceed these requirements. This gun will consist of $3\frac{1}{2}$ cells, constructed of GlidCop-15, an aluminum oxide dispersion strengthened copper alloy. The gun will be capable of operating at duty factors in excess of 1%. Extensive beam dynamics studies of the gun were used to determine the effect of varying the length of the first cell, shaping the apertures between cells, and increasing the number of cells. In addition, a detailed thermal and mechanical study of the gun was performed to ensure that the thermal stresses were well within the allowable limits and that copper erosion of the water channels would not occur.

19199 (BNL–47317) **Polarized wiggler for NSLS x-ray ring design considerations.** Friedman, A.; Krinsky, S.; Blum, E. Brookhaven National Lab., Upton, NY (United States). Mar 1992. 38p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH00016. Order Number DE92012212. Source: OSTI; NTIS; INIS; GPO Dep.

We examine the properties of an elliptically polarized wiggler that will generate circularly polarized photons with energy spectrum of 3–12 KeV. The vertical wiggler magnetic field is produced by permanent magnets while the horizontal wiggler field is generated by electric coils capable of AC excitation. The radiation parameters of the wiggler are presented, including photon flux, circular and linear polarization and spectrum. These parameters are compared to the synchrotron radiation from a bending magnet. Numerical values are calculated for radiation from the wiggler and bending magnet for the NSLS X-ray ring parameters. A conceptual design for such a wiggler is discussed and several different alternatives are analyzed. We consider AC excitation of the wiggler to produce the time modulation of the elliptic polarization, and also to produce time modulated linearly polarized radiation.

19200 (CONF-9105202–, pp. 22, Paper 17) **Linear collider RF structure design using ARGUS.** Kwok Ko (Stanford Linear Accelerator Center, CA (United States)). USDOE Office of Energy Research, Washington, DC (United States). Scientific Computing Staff. [1991]. From 1. energy research power supercomputer users symposium; Gaithersburg, MD (United States); 21-22 May 1991. In *Proceedings of the first energy research power supercomputer users symposium.* 173p. Order Number DE91018677. Source: OSTI; NTIS; INIS.

In a linear collider, both the driving system (klystrons) and the accelerating system (linac) consists of RF structures that are inherently three-dimensional. These structures which are responsible for power input/output, have to satisfy many requirements in order that instabilities, beam or RF related, are to be avoided. At the same time, system efficiencies have to be maintained at optimal to minimize cost. Theoretical analysis on these geometrically complex structures are difficult and until recently, numerical solutions have been limited. At SLAC, there has been a continuing and close collaboration among accelerator physicists, engineers and numericists to integrate supercomputing into the design procedure which involves 3-D RF structures. The outcome is very encouraging. Using the 3-D/electromagnetic code ARGUS (developed by SAIC) on the Cray computers at NERSC in conjunction with supporting theories, a wide variety of critical components have been simulated and evaluated. Aside from structures related to the linear collider, the list also includes the RF cavity for the proposed Boson Factory and the anode circuit for the Cross-Field Amplifier, once considered as an alternative to the klystron as a possible power source. This presentation will focus on two specific structures: (1) the klystron output cavity; and (2) the linac input coupler. As the results demonstrate, supercomputing is fast becoming a viable technology that could conceivably replace actual cold-testing in the near future.

19201 (CONF-9105202–, pp. 7, Paper 20) **Simulation at the SSCL low energy booster and coupled cavity linac.** Bourianoff, G. USDOE Office of Energy Research, Washington, DC (United States). Scientific Computing Staff. [1991]. DOE Contract AC35-89ER40486. From 1. energy research power supercomputer users symposium; Gaithersburg, MD (United States); 21-22 May 1991. In *Proceedings of the first energy research power supercomputer users symposium.* 173p. Order Number DE91018677. Source: OSTI; NTIS; INIS.

During the past year, the SSC has made significant use of the MFE computer center for simulating the low energy accelerators in the SSC complex. There are two primary supercomputer applications reported here. They are the calculation of emittance growth in the LEB due to space charge effects and simulation of the side coupled cavities used in the linac. The SSC is designed to have a luminosity of 10^{33} interactions per second per square centimeter. It directly determines the amount of physics which can be done with the collider and is therefore of critical importance. The luminosity is inversely proportional to the emittance of the two colliding beams. Since emittance increases monotonically through the chain of accelerators, an emittance budget has been set up defining what the allowable emittance increase is in each individual component of the accelerator. The emittance budget for the LEB calls for the emittance to enter the LEB at .4π mm - mrad and leave the LEB at .6π mm -mrad. Therefore, a set of simulations was done to determine the actual emittance growth. The linac is designed to accelerate 25 MA of H^- ions from 70 MEV to 600 MEV. There are several possible cavity designs which might be used but the side coupled cavity design operating in the $\pi/2$ mode has a number of advantages concerning operating stability and ease of manufacture. It has therefore been chosen for the linac accelerator.

19202 (DESY–91-153) **Status report of a 500 GeV S-band linear collider study.** Balewski, K. (Deutsches Elektronen-Synchrotron (DESY), Hamburg (Germany)); Bieler, M.; Bothe, W.; Bredehoeft, K.; Brinkmann, R.; Choroba, S.; Dwersteg, B.; Ebert, M.; Febel, A.; Fischer, R.; Floettmann, K.; Holzer, B.; Juergensen, H.; Kouptsidis, J.; KumpfDeutsches Elektronen-Synchrotron (DESY), Hamburg (Germany). Dec 1991. 42p. Order Number DE92516969. Source: OSTI; NTIS (US Sales Only); INIS.

This paper describes the status of a feasibility study of a 500 GeV center of mass linear collider, which is based almost entirely on conventional rf-technology. The basic components are S-band travelling wave, constant-gradient accelerating structures and 130 MW klystrons. 3 GeV damping rings are used to produce extremely small emittances in both planes which are in the same range as those of the next generation synchrotron light sources. Very strong focussing in the linear accelerator and near the interaction region, as well as a dedicated chromatic correction scheme, are necessary to achieve spot sizes that have not been produced yet. The methods envisaged to stabilize the motion of the tiny beam along the 15 km long linac seem promising and give rise to be assumption that the proposed values can be reached with todays' available technology. (orig.).

19203 (DOE/ER/40583–T2) **Development of low emittance high brightness electron beams and rf accelerating structures: Final technical report.** Pellegrini, C. California Univ., Los Angeles, CA (United States). Dept. of Physics. [1991]. 21p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AS03-90ER40583. Order Number DE92011125. Source: OSTI; NTIS; INIS; GPO Dep.

The main goals of this project were the construction of an S-band RF photoinjector for the production of a high brightness electron beam, and the development of a new type of RF accelerator structure; the Plane wave transformer. By the end of October 1991 the photoinjector had been built, its RF characteristics had been measured at low power, and an initial test of the gun at high RF power had been done. The Plane Wave Transformer had also been built and tested at lower power. In both cases the results obtained are mostly in agreement with the expected and calculated behavior.

19204 (FNAL/C–91/307) **Grounding and shielding in the accelerator environment.** Kerns, Q. Fermi National Accelerator Lab., Batavia, IL (United States). [1991]. 38p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH03000. (CONF-9110118–6: Accelerator instrumentation workshop, Newport News, VA (United States), 28-31 Oct 1991). Order Number DE92011759. Source: OSTI; NTIS; INIS; GPO Dep.

Everyday features of the accelerator environment include long cable runs, high power and low level equipment sharing building space, stray electromagnetic fields and ground voltage differences between the sending and receiving ends of an installation. This paper pictures some Fermilab installations chosen to highlight significant features and presents practices, test methods and equipment that have been helpful in achieving successful shielding. Throughout the report are numbered statements aimed at summarizing good practices and avoiding pitfalls.

19205 (FNAL-TM–1768) **Pump down rate for SRF cavities.** Kuchnir, M. (Fermi National Accelerator Lab., Batavia, IL (United States)); Knobloch, J. Fermi National Accelerator Lab., Batavia, IL (United States). Feb 1992. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH03000. Order Number DE92011703. Source: OSTI; NTIS; INIS; GPO Dep.

This note is about calculations aimed at quantifying adequate pumping speeds of evacuation of normally humid clean-room air from typical Superconducting Radiofrequency (SRF) cavities. The subject is of high relevance to the semiconductor industry, where the yield of VLSI (Very Large Scale Integration) chip production is affected by micron size particles which may cause fatal defects to their micron and sub-micron features. The recent availability of particle counters capable of operating in vacuum has stimulated measurements at reduced pressures in this subject.

19206 (GSI-91-63(prepr.)) **Non-Liouvillean method applied to heavy ion fusion.** Hofmann, I. Gesellschaft fuer Schwerionenforschung mbH, Darmstadt (Germany). Dec 1991. 13p. (CONF-9106260-: Symposium on high brightness beams for advanced accelerator applications, College Park, MD (United States), 6-7 Jun 1991). Order Number DE92516496. Source: OSTI; NTIS (US Sales Only); INIS.

Heavy ions are a challenging option for ICF driver accelerators. We focus on the rf linac /storage ring approach and an advanced scheme for indirectly driven targets. The main emphasis in on an increase of phase space density by means of a non-Liouvillean scheme using photoionization of single charged heavy ions. The required large cross sections are known to exist for Ba^+ stripped to Ba^{++}. In contrast with the non-Liouvillean injection methods proposed by previous authors, we discuss here photoionization for extraction from the storage ring into a compression ring, where the beam stays only a few revolutions. This promises a significant improvement of accelerator performance. Design examples for a full driver scenario as well as an experimental facility leading to an ignition experiment are presented. Experimental results pertaining to the longitudinal microwave instability as one of the key issues are reported and related to the design of an advanced driver accelerator scheme. (orig.).

19207 (INFN-TC-91-07) **TOPGUN: a new way to increase the beam brightness of rf guns.** Serafini, L. (Istituto Nazionale di Fisica Nucleare, Milan (Italy)); Pagani, C.; Rivolta, R.; Ferrarion, M. Istituto Nazionale di Fisica Nucleare, Rome (Italy). 1991. 36p. Order Number DE92626819. Source: OSTI; NTIS (US Sales Only); INIS.

A new method is presented to neutralize the RF induced emittance blow up generated inside RF electron Guns. The method is based on a multi-mode operation of the RF Gun cavity, which must be able to support both the accelerating mode ($TM_{010-\pi}$) and a higher harmonic mode. The analytical study of the beam dynamics, which has been found in good agreement with the numerical simulations, shows that the growth of the normalized rms emittance, produced by the time dependent RF forces during the acceleration in the Gun, can be cancelled up to fourth order terms. This is of great relevance for the improvement of RF Gun performances, since the RF field contribution to the emittance blow up becomes negligible and no more dependent on the unch size. As shown in this paper, with such a new Gun, which is called 'TOPGUN', the way to attain high brightness beams becomes straightforward.

19208 (INS-905) **Exotic Nuclei Arena in JHP.** Nomura, T. Tokyo Univ., Tanashi (Japan). Inst. for Nuclear Study. Dec 1991. 13p. Order Number DE92514955. Source: OSTI; NTIS (US Sales Only); INIS.

The Exotic Nuclei Arena planned in Japanese Hadron Project aims to accelerate various unstable nuclei produced in 1-GeV proton-induced reactions up to 6.5 MeV/u by means of heavy-ion linacs. The present status of research and development for the Earena is briefly reported. The construction of the prototype facility to accelerate unstable beams up to 0.8 MeV/u is planned in 1992-94, in which the existing cyclotron in INS is used as the primary accelerator. (author).

19209 (INS-906) **Ion-optical design of the high-resolution mass separator for the Japanese Hadron Project.** Sunaoshi, Hitoshi (Tohoku Univ., Sendai (Japan). Dept. of Physics); Fujioka, Manabu; Shinozuka, Tsutomu; Wollnik, Hermann; Meuser, Stefan; Nomura, Toru; Kubono, Shigeru. Tokyo Univ., Tanashi (Japan). Inst. for Nuclear Study. Dec 1991. 17p. Order Number DE92514956. Source: OSTI; NTIS (US Sales Only); INIS.

An ion-optical design of the JHP-ISOL is presented. This separator consists of a beam guidance system, a main magnetic separator stage and an electrostatic energy focusing stage. This separator is to be coupled with a heavy-ion linac for post-acceleration of mass separated ions up to 6.5 MeV/u. The design goal of the separator is to realize a mass resolving power of R_M = 20,000 (basal) at a transmission approaching 100 % with the initial phase space of ± 0.2 mm x ± 20 mrad. (author).

19210 (INS-907) **Ion trap project at INS.** Katayama, Ichiro; Wada, Michiharu; Tanaka, Junichi; Kawakami, Hirokane; Ohtani, Shunsuke. Tokyo Univ., Tanashi (Japan). Inst. for Nuclear Study. Dec 1991. 12p. Order Number DE92514957. Source: OSTI; NTIS (US Sales Only); INIS.

We are developing an ion trap system for nuclear physics research at INS using lasers and a Penning trap. It has several important features, no specificity to ion species, fast response due to dynamic trapping and hopefully high trapping efficiency. (author).

19211 (IYaF-91-19) **'Laser string' monitor for measuring nonlinearity.** Levashov, Yu.I.; Mikhal'tsova, I.A.; Pupkov, Yu.A.; Fedotov, M.G. AN SSSR, Novosibirsk (USSR). Inst. Yadernoj Fiziki. 1991. 18p. (In Russian). Order Number DE92624158. Source: OSTI; NTIS (US Sales Only); INIS.

Device for measuring nonlinearity of objects with the length of 50 m maximum within the range of ±2 mm, based on a new optical element has been created. Sources of possible measurement errors of the device are analyzed. Results of laboratory and production tests are presented. 13 refs.; 5 figs.

19212 (JINR-9-90-64) **Phasotron extracted proton beam transport to the target of wide-angle π-meson lens.** Abazov, V.M.; Bragin, A.N.; Gustov, S.A.; Mirokhin, I.V.; Mitsin, G.V.; Savchenko, O.V. Joint Inst. for Nuclear Research, Dubna (USSR). Lab. of Nuclear Problems. 1990. 4p. (In Russian). Order Number DE92626817. Source: OSTI; NTIS (US Sales Only); INIS.

Results on transport of phasotron extracted proton beam to the target of a wide-angle π-meson lens are described. A good agreement of calculated and experimental data is shown. Recommendations of the modification of the channel are considerd. The following parameters are obtained: 1)dimensions of the beam image at the meson-production target are 5 cm horizontally and 2 cm vertically (at level 2); 2)transmission coefficient is 0.91-0.94) 3)maximum permitted initial intensity of extracted proton beam for the echieved loss level as high as 2μA. 5 refs.

19213 (JINR-9-90-69) **Production and study of high-intensity meson beams for biomedical and physical investigations at the JINR phasotron.** Abazov, V.M.; Bragin, A.N.; Gustov, S.A.; Kutuzov, S.A.; Mirokhin, I.V.; Mitsyn, G.V.; Savchenko, O.V. Joint Inst. for Nuclear Research, Dubna (USSR). Lab. of Nuclear Problems. 1990. 10p. (In Russian). Order Number DE92626831. Source: OSTI; NTIS (US Sales Only); INIS.

The results of measurements of the meson beam composition and the estimation of the intensity of meson beam components including the surface muon beam are presented. The intensity of π^--mesons per a μA of the phasotron proton beam is about 2x10^{7} 1/sμA, that of μ^- mesons is ≈1.5x10^{6} 1/sμA. The variant to produce separation meson beams are considered. 12 refs.

19214 (JINR-9-90-107) **Calculations of the injection channel from LU-20 to the Nuclotron.** Beznogikh, Yu.D.; Vasilishin, B.V.; Govorov, A.I.; Kulikov, I.I.; Mikhajlov, V.A.; Monchinskij, V.A.; Seleznev, V.V. Joint Inst. for Nuclear Research, Dubna (USSR). Lab. of High Energy. 1990. 6p. (In Russian). Order Number DE92626820. Source: OSTI; NTIS (US Sales Only); INIS.

The calculation and obtained parameters of the injection channel from the LU-20 to the nuclotron are presented. The beam phase characteristics and horizontal dispersion in the nuclotron are provided. In the vertical plane the achromatic transfer from the linac to the nuclotron plane is realized. 2 refs.; 2 figs.

19215 (JINR-9-90-114) **Application of CCD-camera for size measuring of electron ring by means of synchrotron radiation.** Damish, Yu.; Drozdov, V.A.; Tyutyunnikov, S.I.; Shalyapin, V.N.

Joint Inst. for Nuclear Research, Dubna (USSR). Lab. of Computing Techniques and Automation. 1990. 6p. (In Russian). Order Number DE92626830. Source: OSTI; NTIS (US Sales Only); INIS.

The method is described and the results of measuring of electron ring density distribution are presented. A TV-camera on the basis of a CCD matrix is used as a sensing element. The camera is connected through the interface unit in CAMAC standard with the SM-4 computer. The time exposition of radiaiton is realized by using an electro-optic sutter in the time interval from 0.01 to 1 ms at an operation voltage of 1 kV. 5 refs.

19216 (JINR-13-90-63) **Noise-immunity light guide remote control system of an ion source.** Romanov, Yu.I. Joint Inst. for Nuclear Research, Dubna (USSR). Lab. of High Energy. 1990. 12p. (In Russian). Order Number DE92628169. Source: OSTI; NTIS (US Sales Only); INIS.

A ion source m noise - immunity light guide system with electrodrives of selective transmission of a command on one of 14 channels is described. To increase the noise - immunity of command's messages a radiation - improved fiber-optical channel of the quartz-polymer type and a number - impulse code with repetition protection. 11 refs.

19217 (JINR-R-1-90-75) **A system for beams transport from synchrophasotron and nuclotron to experimental set-ups No. 205.** Barteneva, N.A. (and others); Volobueva, T.I.; Kirillov, A.D. Joint Inst. for Nuclear Research, Dubna (USSR). Lab. of High Energy. 1990. 5p. (In Russian). Order Number DE92628170. Source: OSTI; NTIS (US Sales Only); INIS.

A scheme for accelerated particle beam trasnport from the MV-1 synchrophasotron and Nuclotron is presented. The positioning of the Nuclotron ring at 3.9 m level relatively to the lines of existing channels conditioned the development of beam vertical extraction system. Beam transport from the Nuclotron or the synchrophasotron to building 205 is ensured through a moving doublet of quadrupoles and magnet mounted on a rotating platform. 1 ref.

19218 (KEK-91-10) **Analysis of the prebuncher for the KEK 40-MeV proton linac.** Kato, Takao. National Lab. for High Energy Physics, Tsukuba, Ibaraki (Japan). Dec 1991. 27p. Order Number DE92514988. Source: OSTI; NTIS (US Sales Only); INIS.

The electromagnetic fields of the prebuncher for the KEK 40-MeV proton linac have been studied using the code MAFIA. Part of the calculated results were compared with the experimental results. A beam simulation of the beam transport line between the prebuncher and the linac was performed using code LEBT; it runs on a supercomputer in order to calculate beam dynamics, including space-charge effects. The capture efficiency of the linac and the emittance growth in the beam line are discussed in connection with the space-charge effects. (author).

19219 (LA-UR-92-899) **What are good operators and why are they needed?.** Clay, M.E. Los Alamos National Lab., NM (United States). [1992]. 4p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-920315-11: 3. European particle accelerator conference, Berlin (Germany), 24-28 Mar 1992). Order Number DE92011235. Source: OSTI; NTIS; INIS; GPO Dep.

Sophisticated computer control and automation have made possible the operation of today's enormously complex particle physics facilities. Yet with all of the versatility that this sophisticated technology provides, it would be difficult, if not impossible, for these facilities to attain even minimum required operational goals without the constant supervision and regular intervention of human operators. Furthermore, if operational goals are to be pushed to new limits, then human operators with rare, esoteric talents and skills, commonly referred to as good operators, are required. The need for these operators, together with a discussion of the qualities associated with good operators, are the subjects of this paper.

19220 (LA-UR-92-905) **High intensity negative proton beams from a SNICS ion source.** Evans, C.R.; Hollander, M.G. Los Alamos National Lab., NM (United States). [1991]. 11p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-9110258-5: Symposium of northeastern accelerator personnel, Albuquerque, NM (United States), 15-19 Oct 1991). Order Number DE92011137. Source: OSTI; NTIS; INIS; GPO Dep.

For the past year we have been involved in a project to develop an intense (> $100\mu A$) negative proton beam from a SNICS (Source of Negative Ions by Cesium Sputtering) ion source. This report will cover how we accomplished and exceeded this goal by more than 40%. Included in these observations will be the following: A description of an effective method for making titanium hydride cathodes. How to overcome the limitations of the titanium hydride cathode. The modification of the SNICS source to improve output; including the installation of the conical ionizer and the gas cathode. A discussion of problems including: poisoning the proton beam with oxygen, alternative gas cathode materials, the clogging of the gas inlet, long burn-in times, and limited cathode life times. Finally, how to optimize source performance when using a gas cathode, and what is the mechanism by which a gas cathode operates; facts, fantasies, or myth.

19221 (SAND-91-1624) **Repetitive High Energy Pulsed Power (RHEPP) Temperature Monitoring System utilizing Luxtron fluoroptic sensors and thermocouples technical reference manual.** Laderach, G.E. Sandia National Labs., Albuquerque, NM (United States). Jan 1992. 42p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-76DP00789. Order Number DE92013461. Source: OSTI; NTIS; GPO Dep.

This document describes the Temperature Monitoring System for the RHEPP project at Sandia National Laboratories. The system is designed to operate in the presence of severe repetitive high voltage and electromagnetic fields while providing real time thermal data on component behavior. The thermal data is used in the design and evaluation of the major RHEPP components such as the magnetically switched pulse compressor and the linear induction voltage adder. Particular attention is given to the integration of commercially available hardware and software components with a custom written control program. While this document is intended to be a reference guide, it may also serve as a template for similar applications. 3 refs.

19222 (SAND-91-1626) **Plasma channel generation using low energy electron beams.** Kiekel, P.D. Sandia National Labs., Albuquerque, NM (United States). Feb 1992. 19p. Sponsored by USDOE, Washington, DC (United States); Department of Defense, Washington, DC (United States). DOE Contract AC04-76DP00789. Order Number DE92013770. Source: OSTI; NTIS; INIS; GPO Dep.

A channel ions can focus and guide a relativistic electron beam. This report discuses the generation of plasma channels using magnetically confined low energy electron beams in a low pressure gas. The most significant advantages of these channels are that any gas can be ionized and that they can easily be made to follow a curved path. The major advantages are that the channel is less well confined than a laser produced channel and that a small solenoidal magnetic field is required. This report is intended to be a guide for those technicians and scientists who need to assemble and operate an e-beam generated plasma channel system. Hardware requirements are discussed in detail. There are brief discussions of operating techniques, channel diagnostic, and channel characteristics.

19223 (SAND-91-2208C) **Solid-armature railguns without the velocity-skin effect.** Cowan, M. Sandia National Labs., Albuquerque, NM (United States). [1991]. 6p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-76DP00789. (CONF-9204102-8: 6. symposium on electromagnetic launch technology, Austin, TX (United States), 28-30 Apr 1992). Order Number DE92012630. Source: OSTI; NTIS; GPO Dep.

If the velocity-skin effect could be eliminated, solid-armature railguns might reach high velocity (≥ 6 km/s) without forcing most of the armature current to pass through an arc. Even then, magnetic diffusion (the "normal" skin effect) will limit acceleration. In this paper, the performance limits for railguns which are free from the velocity-skin effect are investigated by deriving the upper limits for a specific kind of power supply. Previous performance estimates made for solid-armature railguns are examined in the light of these results and are found to be relatively very optimistic. A railgun design which limits the velocity-skin effect and which may allow improved performance for solid armatures is described. 6 refs.

19224 (SAND–92-0117C) **Survivable debris shields for laboratory soft x-ray simulation sources.** Spielman, R.B.; Farnsworth, A.V. Jr.; Gustwiller, J.S.; Hedemann, M.A.; Hermina, W.L.; Hussey, T.W.; Lorence, L.J.; Pepping, R.E.; Reilly, J.P.; Reynolds, F.D.; Scrivner, G.J.; Sharpe, A.W.; Thornton, A.L. Sandia National Labs., Albuquerque, NM (United States). [1992]. 10p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-76DP00789. (CONF-920223–6: 1992 hardened electronics and radiation technology (HEART) conference, Albuquerque, NM (United States), 24-28 Feb 1992). Order Number DE92011379. Source: OSTI; NTIS; INIS; GPO Dep.

A survivable debris shield is necessary if very high levels of cleanliness are to be achieved on samples exposed to soft x rays from laboratory simulation sources. These samples, often of optical quality, require a low or zero debris environment in order to distinguish low levels of soft x-ray damage from debris-induced effects. We will describe the development of survivable debris shield technology on the Sandia National Laboratories' Saturn x-ray simulation facility, which permits ultraclean exposure over sample areas of 58 cm^2 @ ~0.35 cal/cm^2, 5 cm^2@ ~0.8 cal/cm^2, cm^2, 2.8 cm^2 @ ~1.2 cal/cm^2, and 0.8 cm^2 @ ~1.5 cal/cm^2 with 3-keV argon K-shell photons. These new fluence-area produce test capabilities represent an order-of-magnitude improvement in the state of the art (previously 0.25 cm^2 @ ~ 1 cal/cm^2 or 1.0 cm^2 @ ~0.35 cal/cm^2) for soft x-ray simulators.

19225 (SLAC-PUB–5649) **Pulse-by-pulse energy measurement at the Stanford Linear Collider.** Blaylock, G. (California Univ., Santa Cruz, CA (United States)); Briggs, D.; Collins, B.; Petree, M. Stanford Linear Accelerator Center, Menlo Park, CA (United States). Jan 1992. 24p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC03-76SF00515. (CONF-9201101–1: SEAM '92: Scientific and Engineering Applications of the McIntosh technical conference and exposition, San Francisco, CA (United States), 15-17 Jan 1992). Order Number DE92011520. Source: OSTI; NTIS; INIS; GPO Dep.

The stanford Linear Collider (SLC) collides a beam of electrons and positrons at 92 GeV. It is the first colliding linac, and produces Z^0 particles for High-Energy Physics measurements. The energy of each beam must be measured to one part in 10^4 on every collision (120 Hz). An Energy Spectrometer in each beam line after collision produces two stripes of high-energy synchrotron radiation with critical energy of a few MeV. The distance between these two stripes at an imaging plane measures the beam energy. The Wire- Imaging Synchrotron Radiation Detector (WISRD) system comprises a novel detector, data acquisition electronics, readout and analysis. The detector comprises an array of wires for each synchrotron stripe. The electronics measure secondary emission charge on each wire of each array. A Macintosh II (using THINK C, THINK Class Library) and DSP coprocessor (using ANSI C) acquire and analyze the data, and display and report the results for SLC operation.

19226 (SLAC-PUB–5760) **A three-gap klystron output cavity at X-band.** Ko, K. (Stanford Linear Accelerator Center, Menlo Park, CA (United States)); Lee, T.G.; Tonegawa, S.; Kroll, N. Stanford Linear Accelerator Center, Menlo Park, CA (United States). Mar 1992. 11p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC03-76SF00515 ;AS03-89ER40527. (CONF-920124–23: Society of Photo-Optical Instrumentation Engineers' international symposium on laser spectroscopy as part of SPIE's symposium on optics, electro-optics and laser applications in science and engineering, Los Angeles, CA (United States), 1 Order Number DE92012417. Source: OSTI; NTIS; INIS; GPO Dep.

A high-power X-band klystron employing a double-gap output cavity has been operating at SLAC. Multi-gap output circuits have lower surface gradients at the interaction gaps than single-gap ones but are prone to self-oscillate due to negative loading and trapped higher-order modes. In the double-gap circuit design, considerable attention had been directed to deal with these stability problems. The performance of the present tube appears to be limited by gap breakdown and beam interception particularly at long pulses. A three-gap output cavity is currently under development to further reduce the gap surface gradient. Another new feature of the circuit is an enlarged downstream drift tube to improve on beam clearance. This paper discusses the considerations involved in designing a multi-gap output cavity and presents the cold test measurements on the three-gap circuit. The experimental data is compared with numerical results from the 3-D simulation code ARGUS.

19227 (SLAC-PUB–5764) **Precision fiducialization of transport components.** Fischer, G.E.; Bressler, V.E.; Cobb, J.K.; Jensen, D.R.; Ruland, R.E.; Walz, H.V.; Williams, S.H. Stanford Linear Accelerator Center, Menlo Park, CA (United States). Mar 1992. 3p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC03-76SF00515. (CONF-920315–10: 3. European particle accelerator conference, Berlin (Germany), 24-28 Mar 1992). Order Number DE92010746. Source: OSTI; NTIS; INIS; GPO Dep.

The Final Focus Test Beam (FFTB) is a transport line designed to test both concept and advanced technology for application to future linear colliders. It is currently under construction at SLAC in the central beam line. Most of the quadrupoles of the FFTB have ab initio alignment tolerances of less than 30 microns, if the planned for beam based alignment tuning procedure is to converge. For such placement tolerances to have any meaning requires that the coordinates of the effective centers, seen by the beam particles, be tansferred to tooling (that can be reached by mechanical or optical alignment methods) located on the outside of the components to comparable or better values. We have constructed an apparatus that simultaneously locates to micron tolerances, the effective magnetic center of fussing lenses, as well as the electrical center of beam position monitors (BPM) imbedded therein, and once located, for transferring these coordinates to specially mounted tooling frames that supported the external retroreflectors used in a laser tracker based alignment of the beam line. Details of construction as well as experimental results from the method are presented.

19228 (SLAC-PUB–5768) **The polarized electron gun for the SLC.** Schultz, D.C.; Clendenin, J.; Frisch, J.; Hoyt, E.; Klaisner, L.; Woods, M.; Wright, D.; Zolotorev, M. Stanford Linear Accelerator Center, Menlo Park, CA (United States). Mar 1992. 3p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC03-76SF00515. (CONF-920315–23: 3. European particle accelerator conference, Berlin (Germany), 24-28 Mar 1992). Order Number DE92012418. Source: OSTI; NTIS; INIS; GPO Dep.

A new polarized electron gun for use on the SLC at SLAC has been built and tested. It is a diode gun with a laser driven GaAs photocathode. It is designed to provide short (2ns) pulses of 10 A at 160 kV at 120 Hz. The design features of the gun and results from a testing program on a new and dedicated beam line are presented. Early results from operation on the SLC will also be shown.

19229 (SLAC-PUB–5775) **Injection system for the PEP II asymmetric B Factory at SLAC.** Fieguth, T. (Stanford Linear Accelerator Center, Menlo Park, CA (United States)); Bloom, E.; Bulos, F.; Davies-White, W.; Donald, M.; Fairfield, K.; Godfrey, G.; Holtzapple, R.; Hutton, A.; Loew, G.; Miller, R.; Sukiennicki, B.; Wen, H.; Ronan, M.; Zisman,Stanford Linear Accelerator Center, Menlo Park, CA (United States); Lawrence Berkeley Lab., CA (United States). Mar 1992. 3p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC03-76SF00515 ;AC03-76SF00098. (CONF-920315–25: 3. European particle accelerator conference, Berlin (Germany), 24-28 Mar 1992; LBL–32075). Order Number DE92012419. Source: OSTI; NTIS; INIS; GPO Dep.

The asymmetric energy B Factory proposed as an upgrade of PEP at Stanford Linear Accelerator Center will require a highly reliable and efficient injection system. The conceptual design has shown the feasibility of extracting 9 GeV electrons and 3.1 GeV positrons from the existing linac and injecting equal charges into 1658 buckets in each of the two rings of the collider. An injection study group has continued the development and study of this proposal and has generated workable designs for many related systems and subsystems.

19230 (SLAC-PUB–5780) **High resolving power spectrometer for beam analysis.** Moshammer, H.W.; Spencer, J.E. Stanford Linear Accelerator Center, Menlo Park, CA (United States). Mar 1992. 3p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC03-76SF00515. (CONF-920315–5: 3. European particle accelerator conference, Berlin (Germany), 24-28 Mar 1992). Order Number DE92010751. Source: OSTI; NTIS; INIS; GPO Dep.

We describe a system designed to analyze the high energy, closely spaced bunches from individual RF pulses. Neither a large solid angle nor momentum range is required so this allows characteristics that appear useful for other applications such as ion beam lithography. The spectrometer is a compact, double-focusing QBQ design whose symmetry allows the Quads to range between F or D with a correspondingly large range of magnifications, dispersion and resolving power. This flexibility insures the possibility of spatially separating all of the bunches along the focal plane with minimal transverse kicks and bending angle for differing input conditions. The symmetry of the system allows a simple geometric interpretationof the resolving power in terms of thin lenses and ray optics. We discuss the optics and the hardware that is proposed to measure emittance, energy, energy spread and bunch length for each bunch in an RF pulse train for small bunch separations. We also discuss how to use such measurements for feedback and feedforward control of these bunch characteristics as well as maintain their stability. 2 refs.

19231 (SLAC-PUB-5782) **A high-power SLED 2 pulse compression system.** Kroll, N.M. (California Univ., San Diego, La Jolla, CA (United States). Dept. of Physics); Farkas, Z.D.; Lavine, T.L.; Menegat, A.; Ruth, R.D.; Wilson, P.B.; Nantista, C. Stanford Linear Accelerator Center, Menlo Park, CA (United States). Mar 1992. 3p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC03-76SF00515 ;AS03-89ER40527. (CONF-920315-13: 3. European particle accelerator conference, Berlin (Germany), 24-28 Mar 1992). Order Number DE92011586. Source: OSTI; NTIS; INIS; GPO Dep.

The enhancement of peak power by means of RF pulse compression has found important application for driving high energy electron linacs, the SLAC linac in particular. The SLAC Energy Doubler (SLED), however, yields a pulse shape in the form of a decaying exponential which limits the applicability of the method. Two methods of improving this situation have been suggested: binary pulse compression (BPC), in which the pulse is compressed by successive factors of two, and SLED II in which the pair of resonant cavities of SLED are replaced by long resonant delay lines (typically waveguides). Intermediate schemes in which the cavity pair is replaced by sequences of coupled cavities have also been considered. In this paper we describe our efforts towards the design and construction of high-power SLED II systems, which are intended to provide drivers for various advanced accelerator test facilities and potentially for the Next Linear Collider itself. The design path we have chosen requires the development of a number of microwave components in overmoded waveguide, and the bulk of this paper will be devoted to reporting our progress.

19232 (SLAC-PUB-5806) **Review of pulsed rf power generation.** Lavine, T.L. Stanford Linear Accelerator Center, Menlo Park, CA (United States). Apr 1992. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC03-76SF00515. (CONF-920315-26: 3. European particle accelerator conference, Berlin (Germany), 24-28 Mar 1992). Order Number DE92012422. Source: OSTI; NTIS; INIS; GPO Dep.

I am going to talk about pulsed high-power rf generation for normal-conducting electron and positron linacs suitable for applications to high-energy physics in the Next Linear Collider, or NLC. The talk will cover some basic rf system design issues, klystrons and other microwave power sources, rf pulse-compression devices, and test facilities for system-integration studies.

19233 (SSCL-561) **Accelerator System String Test (A.S.S.T.) Interconnect Region cold mass connection analysis.** Mendoza, R. Superconducting Super Collider Lab., Dallas, TX (United States). Mar 1992. 16p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC35-89ER40486. Order Number DE92011767. Source: OSTI; NTIS; INIS; GPO Dep.

Two-dimensional axisymmetric linear and nonlinear ANSYS finite element models of the A.S.S.T. Interconnect Region cold mass connection piping sleeve and flange and their adjoining weld (Drawings M30-000499A and M30-000573A) have been developed. These models indicate that a strong, highly localized stress concentration occurs at the interface region of the weld and sleeve parent metal (heat affected zone), at the inner diameter of the sleeve. Therefore, fatigue crack propagation has also been studied. For loading characteristics of 177 N/rad (250 lb total) axial force and 2.533 MPa (25 atm) internal pressure, an initial circumferential crack of 0.15 mm or less will not propagate through the 2 mm thickness of the sleeve within the 150 cycle design lifetime.

19234 (SSCL-Preprint-74) **Beam position monitor electronics using DC coupled demodulating logarithmic amplifiers.** Aiello, G.R.; Mills, M.R. Superconducting Super Collider Lab., Dallas, TX (United States). Mar 1992. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC35-89ER40486. (CONF-920315-18: 3. European particle accelerator conference, Berlin (Germany), 24-28 Mar 1992). Order Number DE92011697. Source: OSTI; NTIS; INIS; GPO Dep.

An electronics circuit operating up to 120 MHz suitable for Beam Position Monitor signal processing is described. Two different channels process signals from the electrodes. Each channel is realized with two cascaded DC coupled demodulating logarithmic amplifiers, providing an output voltage proportional to the logarithm of the input signal amplitude. The outputs from the two channels are processed by differential and summing amplifiers. The difference output produces a voltage proportional to the beam displacement between the electrodes, but both the difference and sum outputs are digitized in order to allow for a software correction of the gain and offset mismatches. The electronics show better characteristics than previous implementations utilizing log-amp circuits. The dynamic range has been increased, keeping the linearity error smaller than 1% over a 65 dB input signal range. The noise characteristics have been improved providing good resolution at low currents. The RF burst response has also been tested showing good characteristics for use on a Linac or Transfer Line. One prototype, working at 60 MHz, has been built and is planned for use on one or more machines at the SSC.

19235 (SSCL-Preprint-75) **A technique for performing the assembly alignment of the SSC dipole magnets.** Viola, R. Superconducting Super Collider Lab., Dallas, TX (United States). Mar 1992. 3p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC35-89ER40486. (CONF-920315-14: 3. European particle accelerator conference, Berlin (Germany), 24-28 Mar 1992). Order Number DE92011695. Source: OSTI; NTIS; INIS; GPO Dep.

An optical alignment system was developed for use during the assembly of the SSC dipole magnets. The system is designed to ensure that a finished magnet's cold mass is level, has the correct sagitta, and is in the proper location relative to the magnet's vacuum vessel. Additionally, this system is capable of precisely determining the off-sets between the magnetic center line and the vacuum vessel's external fiducial points. Major system components are described and the alignment procedure is outlined. The uncertainties associated with each phase of measurement are presented.

19236 (SSCL-Preprint-76) **A time domain control algorithm for global rf feedback loops.** Mestha, L.K. (Superconducting Super Collider Lab., Dallas, TX (United States)); Mangino, J.; Kwan, C.M.; Young, K.S. Superconducting Super Collider Lab., Dallas, TX (United States). Mar 1992. 3p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC35-89ER40486. (CONF-920315-15: 3. European particle accelerator conference, Berlin (Germany), 24-28 Mar 1992). Order Number DE92011694. Source: OSTI; NTIS; INIS; GPO Dep.

Phase-locking the Low Energy Booster to the Mechanism Energy Booster using "Trip-plan" approach is under development. With this scheme it is possible to phase lock the two machines at any time while ramping, even with wide frequency range in the low energy machines. This loop also has the potential to damp the phase oscillations and keep the beam in orbit by using the Low Energy Booster beam signal and a master clock as two moving references. A brief description of the bench test loop set up and the experimental results are shown in this paper to demonstrate the idea. We have investigated the ability of the loop to damp oscillations and also synchronize reference bunches. With the use of special algorithms it looks possible to operate the machine without the radial and beam phase loop. The implementations of such a scheme depends on the computational speed of the processors and the ability of fast Direct Digital Synthesizers to produce the guiding RF signal.

19237 (SSCL-Preprint-78) **Low energy booster main magnet power supply system.** Jach, C.; Winje, R.; Tacconi, E.; Harold, R.; Smedley, K. Superconducting Super Collider Lab., Dallas, TX (United States). Mar 1992. 3p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC35-89ER40486. (CONF-920315-17: 3. European particle accelerator conference, Berlin (Germany), 24-28 Mar 1992). Order Number DE92011693. Source: OSTI; NTIS; INIS; GPO Dep.

The Low Energy Booster (LEB) is rapid cycling synchrotron to be built at the Superconducting Super Collider Laboratory in the injector complex. The Low Energy Booster will be ready for operation by late 1955. The LEB is used to accelerate protons from an injection momentum of 1.2 GeV/c to an extraction momentum of 12 GeV/c. The machine is a separated function design with dipole and quadrupole magnets driven by a single power supply system. Tracking errors between dipoles and quadrupoles are corrected by corrector quadrupole magnets powered from independent power supplies. The dipoles and quadrupoles are excited with a 10 Hz biased sine wave or 1 Hz linear ramp. Change of operating mode from 10 Hz takes no more than 2 hours. This paper describes the present design of the ring magnet power supply system.

19238 (SSCL-Preprint-79) **Improved ferrite biasing scheme for booster rf cavities.** Schaffer, G. Superconducting Super Collider Lab., Dallas, TX (United States). Mar 1992. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC35-89ER40486. (CONF-920315-20: 3. European particle accelerator conference, Berlin (Germany), 24-28 Mar 1992). Order Number DE92011650. Source: OSTI; NTIS; INIS; GPO Dep.

A new engineering design of ferrite tuners for rapid-cycling-booster rf cavities is proposed. The basic concept is to divide a perpendicularly biased ferrite tuner into two (or more) successive or parallel sections which are magnetically biased in opposite directions. This approach aims at several improvements with respect to existing designs: (a) reduction of magnet weight (b), lower eddy currents, (c) reduction (or cancellation) of magnetic fields on beam axis, and (d) possibility of increasing the tuner breakdown voltage by stepwise widening of airgaps between ferrite layers of successive tuner sections. Some details are illustrated for stripline tuners, especially for the Low-Energy- and Medium-Energy-Boosters (LEB and MEB) in the Supercollider injector scenario.

19239 (SSCL-Preprint-80) **Application of superconducting cavities to the collider rings of the SSC.** Schaffer, G. Superconducting Super Collider Lab., Dallas, TX (United States). Mar 1992. 3p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC35-89ER40486. (CONF-920315-16: 3. European particle accelerator conference, Berlin (Germany), 24-28 Mar 1992). Order Number DE92011692. Source: OSTI; NTIS; INIS; GPO Dep.

The rf parameters of the SSC collider rings are briefly characterized by 20 MV peak rf voltage, 3.9 MeV acceleration per turn, and 2 MW rf power ring at a multiple of the 60-MHz bunch frequency of the proton beam injector. 360 or 480 MHz are preferred frequency choices. In the references design, a normalconducting accelerating structure is foreseen which would operate with gradients of typically 1 MV/m. In contrast to this, superconducting cavities can generate fields of 5 MV/m, or possibly more. In combination with a low R/Q-value, the total stored energy in the rf structure could be increased by an order or magnitude. This would help to reduce the undesired effects of transient beam loading, of rf generator noise, and of imperfections in the generator feedforward current, resulting in reduced phase modulation of the particle bunches at the collision area. For 70 mA circulating beam current, eight superconducting single-cell cavities would be required per ring, instead of 32 to 40 single-cell normalconducting cavities. The savings in tunnel space, and a lower coupling impedance would allow a later upgrade of the beam current to and beyond 200 mA, if desired, for a higher collider luminosity.

19240 (UCRL-ID-109283) **Projectile development for railguns using hypervelocity preacceleration.** Susoeff, A.R. (Lawrence Livermore National Lab., CA (United States)); Hawke, R.S.; Sauve, G.L.; Konrad, C.H.; Hickman, R.J. Lawrence Livermore National Lab., CA (United States). 1 Feb 1991. 22p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. Order Number DE92012410. Source: OSTI; NTIS; GPO Dep.

The STARFIRE Project is a joint Lawrence Livermore National Laboratory (LLNL) and Sandia National Laboratories (SNL) effort to achieve hypervelocity projectile launches up to 15 km/s. The apparatus used to achieve this goal is a three stage acceleration system made up of a two-stage light-gas gun (2SLGG) is used as a preaccelerator capable of injecting 2 gram projectiles at velocities of 6 km/s or more. Projectiles used in this environment are subject to many conditions. Some of these which effect projectile design include: acceleration loading, structural response, barrel condition and alignment. Development of a projectile to satisfy the programmatic requirements is underway. This report covers the evolution of design and fabrication for railgun projectiles from previous experience at LLNL to the replenished plasma armature and projectile now used on STARFIRE. Projectile design, development and fabrication methods which use off-the-shelf materials and standard techniques to meet the operational criteria of the experimental program are discussed in this paper. Initial work involving the design and fabrication of skirted projectiles, which are expected to further reduce interaction phenomena between the plasma armature and railgun barrel, is also described.

19241 (UCRL-JC-109672) **A mechanical connector design for high-current, high-coulomb pulsed power systems.** Susoeff, A.R.; Hawke, R.S.; Leighton, K.S. Lawrence Livermore National Lab., CA (United States). 25 Feb 1992. 8p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48 ;AC04-76DP00789. (CONF-9204102-7: 6. symposium on electromagnetic launch technology, Austin, TX (United States), 28-30 Apr 1992). Order Number DE92012678. Source: OSTI; NTIS; GPO Dep.

A technique to make reliable high-current, high-coulomb electrical contact was developed for transmitting power into railguns. The method uses spring loaded removable connectors that are installed independently from the launcher. The simple rod-type design and absence of fastener holes allow maximum utilization of material mechanical properties. Repeated experiments with 9.5-mm diameter connectors demonstrated reliable pulsed charge transfer of 200 coulombs at currents of over 400kA. 20 refs.

4304 Storage Rings

19242 (ANL/CP-75861) **RF impedance measurement status for the 7-GeV Advanced Photon Source (APS).** Song, J.J.; Kustom, R.L. Argonne National Lab., IL (United States). [1992]. 3p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38. (CONF-920315-31: 3. European particle accelerator conference, Berlin (Germany), 24-28 Mar 1992). Order Number DE92013060. Source: OSTI; NTIS; INIS; GPO Dep.

Beam-coupling impedances (Z) for the 7-GeV APS storage ring have been numerically estimated. In order to confirm these calculations, the wire method with a synthetic pulse technique was used to measure the beam coupling impedance of various vacuum components around the main storage ring. A section of the beam+antechambers, a vacuum isolation valve with and without the RF shielding screen, an insertion device, and a photon absorber were used as a device under test (DUT) to obtain the results. The results were compared with the computer simulations and the Z or k-dependence on bunch lengths was studied.

19243 (BNL-46615, pp. 1-13) **Introduction.** Krinsky, S. (Brookhaven National Lab., Upton, NY (United States)); Bittner, J.; Fauchet, A.M.; Johnson, E.D.; Keane, J.; Murphy, J.; Nawrocky, R.J.; Rogers, J.; Singh, O.V.; Yu, L.H. Brookhaven National Lab., Upton, NY (United States). Sep 1991. (CONF-8908288-1: United States Particle Accelerator School, Upton, NY (United States), Aug 1989). In *Storage ring development at the National Synchrotron Light Source.* 98p. Order Number DE92002064. Source: OSTI; NTIS; INIS.

Research utilizing synchrotron radiation was initially carried out parasitically on synchrotrons and storage rings designed and operated for high energy physics. The National Synchrotron Light

Source (NSLS) at Brookhaven National Laboratory was one of the first facilities developed as a dedicated synchrotron radiation source. The NSLS facility is comprised of an 80 MeV electron linac which injects into a small (28-m circumference) booster synchrotron which accelerates the electrons up to 750 MeV. The booster serves as a full energy injector for the VUV storage ring, which operates at 750 MeV to provide radiation in the ultraviolet and soft X-ray regions of the spectrum. The booster also is used to inject electrons into the X-ray storage ring which operates at 2.5 GeV providing hard X-rays. Based upon the work of G.K. Green and R. Chasman the NSLS storage rings were designed to maximize the brightness of the synchrotron radiation source, i.e. maximize photons/sec/phase-space volume/unit bandwidth. The fundamental importance of brightness as a figure of merit of the radiation source is that brightness is left invariant by linear focusing optics. The photon beam can be focused to a small spot size at the expense of introducing a large angular divergence, or can be made very parallel at the expense of increasing the spot size. However, if an experiment requires an intense highly parallel photon beam incident on a small sample, then a high brightness source is required. In order to provide a high source brightness, the NSLS storage rings were designed to have small emittance. This was accomplished by using the Chasman-Green lattice design which utilizes achromatic bends with zero-dispersion insertions bounded by quadrupole doublets in the VUV ring and quadrupole triplets in the X-ray ring. The lattice functions for the VUV and X-ray rings are given.

19244 (BNL--46615, pp. 14-20) **Transverse beam profile monitor.** Brookhaven National Lab., Upton, NY (United States). Sep 1991. (CONF-8908288--1: United States Particle Accelerator School, Upton, NY (United States), Aug 1989). In *Storage ring development at the National Synchrotron Light Source.* 98p. Order Number DE92002064. Source: OSTI; NTIS; INIS.

During the commissioning and operation of an electron storage ring it is useful to be able to measure the transverse profile of the electron beam. The vertical and horizontal beam sizes yield information about the beta functions and emittance. The vertical size and skewness of the beam profile are measures of the horizontal-vertical coupling. Transverse instabilities can be observed as they occur even if they have no dipole moment and go undetected by pickup electrodes or striplines, and ion trapping is easily detected as a vertical expansion of the beam. A non-destructive way of determining the beam profile is by imaging the synchrotron radiation produced in the bending magnets. The optical intensity of the profile in the image plane is proportional to the electron density in the source plane. Several means of producing an image are possible, including using zone plates or curved grazing-incidence mirrors to focus X-rays; pinholes to collimate X-rays; or lenses to focus visible light. The last two methods are the simplest and the authors will describe them in more detail.

19245 (BNL--46615, pp. 21-26) **Bunch length measurements in the VUV storage ring.** Brookhaven National Lab., Upton, NY (United States). Sep 1991. (CONF-8908288--1: United States Particle Accelerator School, Upton, NY (United States), Aug 1989). In *Storage ring development at the National Synchrotron Light Source.* 98p. Order Number DE92002064. Source: OSTI; NTIS; INIS.

Measurements of the bunch length have been made as part of a study of current-dependent phenomena to provide a complete characterization of the VUV ring. Scaling laws have been put forth for the anomalous bunch lengthening with current which is generally observed in storage rings. However, there is no complete theory of the lengthening phenomenon and it is of great interest to compare the behavior of existing machines to the scaling laws. In addition, high peak currents are sought both for damping rings for linear colliders and for free-electron laser drivers and might be achieved through low-momentum compaction lattices. Finally since the bunch lengthening depends on the vacuum chamber. The accepted scaling law of bunch length with current contains the RF voltage, electron energy and momentum compaction. The VUV ring was particularly interesting for such measurements because one could separately and easily vary both the electron energy and the momentum compaction. Although the ring is injected at full energy (750 MeV) the authors have had extensive experience running the ring at low-energy (as low as 80 MeV) for the TOK project. In the following they discuss their measurement technique. The low current bunch length in operational conditions is on the order of 170 psec (σ), i.e., comparable to or longer than the vacuum pipe's smallest dimension, and allows a simple measurement. They present data of bunch length versus current (up to 500 mA in a single bunch), varying electron energy and momentum compaction. Finally, a fit of the data with the Chao-Gareyte model is discussed.

19246 (BNL--46615, pp. 27-37) **Photoelectric effect photon beam position monitors.** Brookhaven National Lab., Upton, NY (United States). Sep 1991. (CONF-8908288--1: United States Particle Accelerator School, Upton, NY (United States), Aug 1989). In *Storage ring development at the National Synchrotron Light Source.* 98p. Order Number DE92002064. Source: OSTI; NTIS; INIS.

Stability of the electron orbit is of critical importance at the NSLS. Many experimenters utilizing the NSLS photon beams can take full advantage of the small transverse dimensions of the source only if the electron orbit variation is kept below 10 to 20% of the transverse electron bunch size. Clearly the first step in a program to stabilize the orbit is to develop position monitors with the required sensitivity, reliability and dynamic range. Of great importance are monitors detecting the photon beams themselves, and also monitors measuring the position of the electron beam. In this section the authors discuss photon beam position monitors utilizing the photoelectric effects, and in the following section the use of capacitively coupled pick-up electrodes to detect electron beam position will be described. In what follows they shall proceed to consider two generic types of monitor geometries (1) Gap monitors, which are designed with the idea that the fringes of the synchrotron radiation will be measured, and the hot or fundamental beam will pass through the monitor unimpeded. (2) Area monitors, which are comprised of two triangular elements nested together similar to the electrodes of a split ion chamber or the diodes described by Siddons and Kraner or Mitsuhashi et al.

19247 (BNL--46615, pp. 38-46) **Receivers for processing electron beam pick-up electrode signals.** Brookhaven National Lab., Upton, NY (United States). Sep 1991. (CONF-8908288--1: United States Particle Accelerator School, Upton, NY (United States), Aug 1989). In *Storage ring development at the National Synchrotron Light Source.* 98p. Order Number DE92002064. Source: OSTI; NTIS; INIS.

There are several methods of determining the transverse position of the electron beam, based upon sensing either the electric field, the magnetic field, or both. At the NSLS the transverse beam position monitors each consist of a set of four circular electrodes. There are 48 sets of pick-up electrodes in the X-ray ring and 24 in the VUV storage ring for determining the electron orbit, and a few extra sets installed for specialized purposes. When the beam passes between the four electrodes, charge is induced on each electrode, the amount depending upon the distance of the beam from that electrode. If V_a, V_b, V_c and V_d given by a difference between pairs of electrodes normalized for variations in beam current by dividing by the sum of electrode voltages. The method of processing these signals depends upon their time structure. The electrons circulating around the vacuum chamber are concentrated in short bunches within stability buckets produced by the accelerating voltage in the RF cavities. The charges induced on the pickup electrodes then are narrow pulses, a fraction of a nanosecond long, and would result in a monopolar voltage pulses if it were not for the impedance of the cable connecting the electrode to the processing apparatus. The capacitance between each electrode and the chamber wall is only a few picofarads and is effectively in parallel with the cable impedance (50 ohms). Thus an appreciable amount of the charge flows off the electrode while the bunch is between the electrodes, resulting in potential of opposite sign as the bunch is leaving the vicinity of the electrode. The resulting signal consists of a series of bipolar pulses, each of less than one nanosecond duration.

19248 (BNL--46615, pp. 47-57) **Real time global orbit feedback system.** Brookhaven National Lab., Upton, NY (United States). Sep 1991. (CONF-8908288--1: United States Particle Accelerator School, Upton, NY (United States), Aug 1989). In *Storage ring development at the National Synchrotron Light Source.* 98p. Order Number DE92002064. Source: OSTI; NTIS; INIS.

Stability of the electron orbit is essential for the utilization of a low emittance storage ring as high brightness radiation source. For an individual user, the required orbit stability can be achieved by a local bump feedback system. However, to install local bump feedback systems for every beamline is both costly and impractical. The coupling between different local bumps may introduce instability, and there may not be enough space for the large number of trim coils required. Here the authors discuss an approach for improving the stability of the closed orbit, by implementing a feedback system based upon harmonic analysis of the orbit movements and the correction magnetic fields. This harmonic feedback system corrects the Fourier components of the orbit nearest to the betatron tune, an approach which yields an orbit whose stability is sufficient for most experiments. The needs of the experiments requiring the tightest orbit tolerances can still be dealt with by additional local orbit feedback systems. Harmonic orbit correction is an effective technique for eliminating global orbit distortion in storage rings resulting from inevitable magnetic field errors distributed around the ring. The their knowledge, this approach has not previously been applied dynamically to eliminate orbit fluctuations arising from time varying magnetic field errors. They have developed a harmonic feedback system which is implemented on a real time basis using relatively simple electronics. The Fourier analysis is done by a simple linear analog network. The input voltages are proportional to the orbit displacements at the detectors, and in real time the output voltages are proportional to the desired Fourier harmonic coefficients. The feedback does not force the displacement to be zero at the detectors, but forces the coefficients of a few harmonics nearest the betatron tune to vanish.

19249 (BNL–46615, pp. 58-68) **Local orbit feedback.** Brookhaven National Lab., Upton, NY (United States). Sep 1991. (CONF-8908288–1: United States Particle Accelerator School, Upton, NY (United States), Aug 1989). In *Storage ring development at the National Synchrotron Light Source.* 98p. Order Number DE92002064. Source: OSTI; NTIS; INIS.

Critically aligned experiments are sensitive to small changes in the electron beam orbit. At the NSLS storage rings, the electron beam and photon beam motions have been monitored over the past several years. In the survey conducted in 1986 by the NSLS Users Executive Committee, experimenters requested the vertical beam position variation and the vertical angle variation, within a given fill, remain within 10 μm and 10 μr, respectively. This requires improvement in the beam stability by about one order of magnitude. At the NSLS and SSRL storage rings, the beam that is originally centered on the position monitor by a dc orbit correction is observed to have two kinds of motion: a dc drift over a storage period of several hours and a beam bounce about its nominal position. These motions are a result of the equilibrium orbit not being held perfectly stable due to time-varying errors introduced into the magnetic guide field by power supplies, mechanical vibration of the magnets, cooling water temperature variations, etc. The approach to orbit stabilization includes (1) identifying and suppressing as many noise sources on the machine as possible, (2) correcting the beam position globally (see Section 6) by controlling a number of correctors around the circumference of the machine, and (3) correcting the beam position and angle at a given source location by position feedback using local detectors and local orbit bumps. The third approach, called Local Orbit Feedback will be discussed in this section.

19250 (BNL–46615, pp. 69-76) **Active interlock system for high power insertion devices in the x-ray ring.** Brookhaven National Lab., Upton, NY (United States). Sep 1991. (CONF-8908288–1: United States Particle Accelerator School, Upton, NY (United States), Aug 1989). In *Storage ring development at the National Synchrotron Light Source.* 98p. Order Number DE92002064. Source: OSTI; NTIS; INIS.

In modern synchrotron radiation rings photon beams generated by high power insertion devices (IDs) may be sufficiently intense to cause severe thermal damage to the machine vacuum chamber if mis-steered. Thus when operating a storage ring with the IDs, great care must be exercised to prevent mis-steering of the electron beam orbit. At present, the X-ray ring operates with three IDs, namely two hybrid wigglers (HBW) at X-21 and X-25,a nd a 5-Tesla superconducting wiggler at X-17. All wigglers are located in low-beta straight sections. In the straight sections. In the straight sections, beam orbit may be deflected by as much as ±8 mrad without scraping the chamber wall. For various reasons it was not possible to design the X-ray ring vacuum chamber to be safe under all possible operating conditions, however, the chamber is safe for $i < 7$ mA, all horizontal beam deflection angles and for vertical angles $< \pm 2.5$ mrad. To protect the machine vacuum chamber from damage due to mis-steered beams, and interlock system has been developed and installed. This system utilizes active beam position detectors which continuously monitor beam motion in each of the ID straight sections and logic circuitry which interrupts the RF and dumps the stored beam in the case of a fault.

19251 (BNL–46615, pp. 77-85) **Bunch lengthening cavity for the VUV ring.** Brookhaven National Lab., Upton, NY (United States). Sep 1991. (CONF-8908288–1: United States Particle Accelerator School, Upton, NY (United States), Aug 1989). In *Storage ring development at the National Synchrotron Light Source.* 98p. Order Number DE92002064. Source: OSTI; NTIS; INIS.

The electron beam lifetime in the VUV Ring is limited by the loss of electrons due to intrabunch (Touschek) scattering. The loss rate due to the Touschek effect is proportional to the electron bunch density. Hence, in order to increase the beam lifetime one must reduce the bunch density. On the other hand, a key design feature of the VUV Ring is the achievement of high brightness of the photon sources by having an electron beam with small transverse beam dimensions. Therefore, to increase the beam lifetime without reducing the source brightness the authors have been led to the use of a fourth-harmonic RF cavity to increase the bunch length.

19252 (BNL–46615, pp. 86-95) **SXLS storage ring design.** Brookhaven National Lab., Upton, NY (United States). Sep 1991. (CONF-8908288–1: United States Particle Accelerator School, Upton, NY (United States), Aug 1989). In *Storage ring development at the National Synchrotron Light Source.* 98p. Order Number DE92002064. Source: OSTI; NTIS; INIS.

X-ray lithography has emerged as a strong candidate to meet the demands of ever finer linewidths on integrated circuits, particularly for linewidths less than .25 microns. Proximity printing X-ray lithography makes use of soft X-rays to shadow print an image of a mask onto a semiconductor wafer to produce integrated circuits. To generate the required X-rays in sufficient quantities to make commercial production viable, electron storage rings have been proposed as the soft X-ray sources. Existing storage rings have been used to do the initial development work and the success of these efforts has led the lithographers to request that new rings be constructed that are dedicated to X-ray lithography. As a result of a series of workshops held at BNL [10.3] which were attended by both semiconductor and accelerator scientists, the following set of zeroth order specifications' on the light and electron beam of a storage ring for X-ray lithography were developed: critical wavelength of light: $\lambda_c = 6$ to 10 angstroms, white light power: $P = 0.25$ to 2.5 watts/mrad, horizontal collection angle per port: $\theta = 10$ to 50 mrad, electron beam sizes: $\sigma_x \approx \sigma_y < 1$ mm, electron beam vertical angular spread $\sigma_y{}' < 1$ mrad.

19253 (BNL–47356) **Conceptual design study of an intense x-ray source for coronary angiography.** Blumberg, L.N. Brookhaven National Lab., Upton, NY (United States). Mar 1992. 37p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH00016. Order Number DE92013011. Source: OSTI; NTIS; GPO Dep.

Calculations are presented for several 1.4 GeV electron storage ring designs which, with an ultra-high field (80 kG) superconducting wiggler magnet and beam current $I = 400$ mA, will generate a 33.16 keV x-ray beam at 20 m from the wiggler of adequate intensity (6 10^9/mm^{-2} sec^{-1}) and areal size for iodine K-edge coronary dichromography in humans.

19254 (DESY–91-146) **A Fokker-Planck treatment of stochastic particle motion within the framework of a fully coupled 6-dimensional formalism for electron-positron storage rings including classical spin motion in linear approximation.** Barber, D.P.; Heinemann, K.; Mais, H.; Ripken, G. Deutsches Elektronen-Synchrotron (DESY), Hamburg (Germany). Dec 1991. 85p. Order Number DE92516977. Source: OSTI; NTIS (US Sales Only); INIS.

In the following report we investigate stochastic particle motion in electron-positron storage ring in the framework of a Fokker-Planck treatment. The motion is described by using the canonical variables χ, p_χ, z, p_z, $\sigma = s - cxt$, $p_\sigma = \Delta E/E_0$ of the fully six-dimensional formalism. Thus synchrotron- and betatron-oscillations are treated simultaneously taking into account all kinds of coupling (synchro-betatron coupling and the coupling of the betatron oscillations by skew quadrupoles and solenoids). In order to set up the Fokker-Planck equation, action-angle variables of the linear coupled motion are introduced. The averaged dimensions of the bunch, resulting from radiation damping of the synchro-betatron oscillations and from an excitation of these oscillations by quantum fluctuations, are calculated by solving the Fokker-Planck equation. The surfaces of constant density in the six-dimensional phase space, given by six-dimensional ellipsoids, are determined. It is shown that the motion of such an ellipsoid under the influence of external fields can be described by six generating orbit vectors which may be combined into a six-dimenional matrix B(s). This 'bunch-shape matrix', B(s), contains complete information about the configuration of the bunch. Classical spin diffusion in linear approximation has also been included so that the dependence of the polarization vector on the orbital phase space coordinates can be studied and another derivation of the linearized depolarization time obtained. (orig.).

19255 (GSI–91-37) **The theory of Schottky spectra of ordered ion beams in a storage ring.** Avilov, V.V.; Hofmann, I. Gesellschaft fuer Schwerionenforschung mbH, Darmstadt (Germany). Dec 1991. 40p. Order Number DE92785038. Source: OSTI; NTIS (US Sales Only).

The longitudinal Schottky spectrum of an ultra-cold ion beam in a storage ring is calculated in the frame of harmonic oscillations of a 1d Coulomb lattice. It is assumed that the extremely high cooling rate required to bring the beam into a one-dimensional ordered chain can be provided by electron or laser cooling. The anharmonic transversal oscillations with temperature much higher then the longitudinal one are taken into account within the self-consistent phonon approximation. The Schottky spectrum measured by the pick-up system consists of bands located near the harmonics of the revolution frequency of the beam. The total intensity of each band characterizes the temperature distribution of the phonons in an ionic chain. The amplitude and the width of the peaks in the spectrum are a function of the strength of relaxation processes (cooling and heating) as well as the Coulomb correlations, rsp. ordering. It is suggested that a careful analysis of these spectra could be a signature of the presence of 1d ordering in the beam. (orig.).

19256 (IFVE–91-80) **Design-technical peculiarities of a small-sized equipment for the production of SC transposed cable for the UNK.** Borisov, E.R.; Surkov, A.N. Gosudarstvennyj Komitet po Ispol'zovaniyu Atomnoj Ehnergii SSSR, Serpukhov (USSR). Inst. Fiziki Vysokikh Ehnergij. 1991. 14p. (In Russian). Order Number DE92626839. Source: OSTI; NTIS (US Sales Only); INIS.

Submitted to the journal Ehlektrotekhnika.

Technological grounds for designing a small-sized transposing equipment, which produces transposed wires of high critical and technological characteristics are given. The design of the equipment based on the proposed approaches has been worked out. Two devices of this type have been manufactured and put into operation. They are considerably advantageous as compared with their analogue worked out in Belgium for SSC. 6 refs.; 7 figs.; 2 tabs.

19257 (IHEP-OEF–91-149) **3 Tev UNK as a kaon and antiproton factory for hadron spectroscopy.** Garkusha, V.I.; Kartashev, V.P.; Kotov, V.I.; Prokoshkin, Yu.D.; Yushchenko, O.P. Gosudarstvennyj Komitet po Ispol'zovaniyu Atomnoj Ehnergii SSSR, Serpukhov (USSR). Inst. Fiziki Vysokikh Ehnergij. 1991. 3p. Order Number DE92626840. Source: OSTI; NTIS (US Sales Only); INIS.

Low-energy high intensity pure kaon and antiproton beams, available at the 3 TeV UNK, are discussed. 4 refs.; 1 fig.

19258 (INFN-LNF–90-019(R)) **Proposal of measuring the mechanisms of nuclear excitation leading to fission with the ADONE jet-target tagged photon beam.** Lucherini, V. (Istituto Nazionale di Fisica Nucleare, Frascati (Italy). Lab. Nazionale di Frascati); Bianchi, N.; De Sanctis, E.; Guaraldo, C.; Levi Sandri, P.; Muccifora, V.; Polli, E.; Reolon, A.R.; Rossi, P.; Aiello, S.; De Filippo, E.; Lanzano', G.; LoIstituto Nazionale di Fisica Nucleare, Rome (Italy). 1990. 16p. Order Number DE92626841. Source: OSTI; NTIS (US Sales Only); INIS.

22refs.

The mechanisms of excitation with subsequent fission of heavy nuclei can be conveniently studied by means of photons, since this probe is able to interact deeply inside the nucleus. We propose the use of the (200-1200 MeV) tagged photon beam from the ADONE Jet Target in order to study the mass-energy and total momentum distributions of fission fragments, to obtain experimental information on the configurations (excitation energy and nucleonic composition) of produced compound nuclei and on their decay channels.

19259 (INFN-LNF–91-031(R)) **Chromaticity.** Guiducci, S. (Istituto Nazionale di Fisica Nucleare, Frascati (Italy). Lab. Nazionale di Frascati). Istituto Nazionale di Fisica Nucleare, Rome (Italy). 1991. 15p. Order Number DE92626842. Source: OSTI; NTIS (US Sales Only); INIS.

A simple calculation of the contribution of quadrupoles and sextupoles to storage ring chromaticity is given. Problems arising from chromaticity carrection are discussed. An accurate derivation of chromaticity formulae for a general bending magnet, exact also for small machines with small radius of curvature, is given.

19260 (INFN-TC–91-08) **A complete stochastic description of internal targets effects on electron rings.** Taiuti, M. (Istituto Nazionale di Fisica Nucleare, Genoa (Italy)); Costa, C.; Anghinolfi, M.; Corvisiero, P.; Ricco, G.; Ripani, M.; Zucchiatti, A.; Muccifora, V.; Bianchi, N.; De sanctis, E.; Levisandri, P.; Lucherini, V.; Polli, E.; Gervino, G.; Mokeev,.Istituto Nazionale di Fisica Nucleare, Rome (Italy). 1991. 21p. Order Number DE92628179. Source: OSTI; NTIS (US Sales Only); INIS.

The effects of internal targets on the beam accumulated in electron storage rings are studied with a linear stochastic model which describes the beam emittance and the beam phase space growth and provides simple formulae for the longitudinal and transverse beam emittance. The description of facilities with and without beam damping is carried out in a consistent way. The obtained results are comparable to those obtained with other models and numerical simulations.

19261 (SLAC–378, pp. 35-95) **Future possibilities for LEP.** Treille, D. (CERN, Geneva (Switzerland)). Stanford Linear Accelerator Center, Menlo Park, CA (United States). Jan 1991. (CONF-900799–: 18. SLAC summer institute on particle physics: heavy quarks and gauge bosons, Stanford, CA (United States), 16-27 Jul 1990). In *Gauge bosons and heavy quarks: Proceedings of Summer Institute on Particle Physics.* 528p. Order Number DE91011248. Source: OSTI; NTIS; INIS.

To go beyond the LEP 1 program, one can (1) increase the c.m. energy; (2) increase the luminosity, an option technically related to the previous one; (3) increase the sensitivity to possible deviations from the Standard Model by polarizing the beams. These upgrades open up the way to many possibilities for physics concerning accurate measurements as well as searches for the new effects. They also require, from the theoretical and experimental points of view, several improvements and changes. These various topics and their interrelatedness are reviewed and discussed.

19262 (SLAC–378, pp. 239-257) **B-factory storage ring design.** Rees, J.R. (Stanford Univ., CA (United States)). Stanford Linear Accelerator Center, Menlo Park, CA (United States). Jan 1991. (CONF-900799–: 18. SLAC summer institute on particle physics: heavy quarks and gauge bosons, Stanford, CA (United States), 16-27 Jul 1990). In *Gauge bosons and heavy quarks: Proceedings of Summer institute on Particle Physics.* 528p. Order Number DE91011248. Source: OSTI; NTIS; INIS.

In the past few years a good deal of enthusiasm has arisen in the US, Europe and Asia for B-Factories. In these machines electrons and positrons are collided with center-of-mass energies at or near the Y(4s) resonance, with unprecedented high luminosities, to produce copious fluxes of B-mesons. The object is to make high-precision studies of the CP non-conserving B decays. Various colliding-beam configurations have been suggested including both linear colliders and storage rings, but one scheme has emerged as generally preferable to the others. It is the asymmetric storage ring system-asymmetric in the sense that the two beam energies are markedly different and the center of mass is moving in the direction of the higher energy beam. With this arrangement the decaying B-mesons fly off from the interaction region in the same direction, and the time-order of their decays can be deduced from the locations of their decay vertices. These B-Factories present the accelerator builder with two main challenges: to achieve luminosity far beyond that attained in existing storage rings and to do it in the unexplored arena of unequal beam energies. Fortunately the means of meeting these challenges appear to be in hand on the basis of the present understanding of the accelerator physics of colliding-beam storage rings. The problems have been studied in several laboratories in Europe, Japan, the US and the USSR, and the solutions devised in those studies have converged in their general features. A B-Factory will consist of two separate storage rings with a common collision region; each ring will carry what it, by today's standards, high circulating beam currents, and as a consequence, the vacuum chambers will be very well-cooled and strongly vacuum-pumped; and mechanical designs of the interaction regions will be quite complicated, but also quite feasible.

19263 (AECB-C–117) **Requirements for gamma radiation survey meter calibration: Proposed regulatory guide.** Atomic Energy Control Board, Ottawa, ON (Canada). 28 Nov 1990. 26p. (In English, French). Order Number DE92626968. Source: OSTI; NTIS (US Sales Only); INIS.

This guide describes the minimum requirements for calibrating a portable analog gamma radiation survey meter by means of a beam calibrator, with a known calibration source. If an alternative method of calibration is to be used the licensee should make a written request to the Atomic Energy Control Board that describes the calibration method to be used, and request the Board's permission to use that method in place of the requirements contained in this guide. This guide explains: the responsibility for survey meter calibration if licensees calibrate their own survey meters, use the services of a Canadian calibration agency, and use the services of a non-Canadian calibration agency; the requirements for survey meter calibration and the supporting documentation; the requirements for record-keeping; and, a calibration certificate, a calibration sticker, and a notification of failure to calibrate form, with examples.

19264 (AECL–9433) **The Sudbury neutrino observatory.** McLatchie, W. (Queen's Univ., Kingston, ON (Canada)); Earle, E.D. Atomic Energy of Canada Ltd., Chalk River, ON (Canada). Chalk River Nuclear Labs. Apr 1987. 13p. (CONF-8704405–: 12. Science teachers seminar, Chalk River (Canada), 2-4 Apr 1987; SNO–87-5.). Order Number DE92626994. Source: OSTI; NTIS (US Sales Only); INIS.

A group of Canadian scientists, in collaboration with colleagues from the United States and England, proposes to establish a world class laboratory in INCO's Creighton Mine. The laboratory would be dedicated to the study of neutrinos from the sun and other astrophysical objects to advance our understanding of the physical processes which govern the properties of stars, as well as our understanding of the fundamental properties of matter. The laboratory would capitalize on two unique Canadian resources, i.e. access to one of the deepest mines in the western hemisphere and Canada's temporary surplus of heavy water.

19265 (ANL-HEP-CP–90-33) **Rad-hard electronics development program for SSC liquid-argon calorimeters.** Stevens, A. (Argonne National Lab., IL (USA). High Energy Physics Div.); Dawson, J.; Kraner, H.; Radeka, V.; Rescia, S. Argonne National Lab., IL (United States). High Energy Physics Div. [1990]. 10p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38 ;AC02-76CH00016. (BNL–45624;CONF-900348–6: 2. international industrialization symposium on the super collider (IISSC), Miami, FL (United States), 14-16 Mar 1990). Order Number DE90011107. Source: OSTI; NTIS; INIS; GPO Dep.

The development program for radiation-hard low-noise low-power front-end electronics for SSC calorimetry is described. Radiation doses of up to 20 MRad and neutron fluences of 10^{14} neutrons/cm^2 are expected over ten years of operation. These effects are simulated by exposing JFETs to neutrons and ionizing radiation and measuring the resulting bias, leakage current and noise variations. In the case of liquid-argon calorimeters, a large part of the front-end circuitry may be located directly within the low-temperature environment (90 K), placing additional constraints on the choice of components and on the design. This approach minimizes the noise and the response time. The radiation damage test facilities at Argonne will also be described. These include sources of neutrons, electrons, and gamma radiation. 8 refs., 9 figs.

19266 (ANL-HEP-CP–90-88) **Simulation studies for design optimisation of a scintillator plate calorimeter.** F. Proudfoot, J. (Argonne National Lab., IL (USA)); Job, P.K.; Trost, H.J.; Handler, T.; Gabriel, T. Oak Ridge National Lab., TN (United States). [1990]. 10p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400 ;W-31109-ENG-38 ;FG05-91ER40627. (CONF-9010212–23: Symposium on detector research and development for the Superconducting Super Collider, Fort Worth, TX (United States), 15-18 Oct 1990). Order Number DE91004768. Source: NTIS, PC A02/MF A01; OSTI; INIS; GPO Dep.

Results on simulations studies relating to the optimisation of a sampling scintillator plate calorimeter for an SSC detector system are presented. These studies show that whereas a compensating sampling geometry can be obtained using a variety of configurations using either lead or depleted uranium as the principal absorber, no configuration based on a pure iron absorber is compensating. Unlike in a lead system, delayed energy release from long lived shower products produced in a uranium system pose a serious pile up problem. Therefore we advocate the use of lead as the principal absorber in this calorimeter. Work on optimisation of the mechanical structure is in progress and results are presented on issues such as structural support, tolerances and on the degradation in response due to other detector material within the volume of the calorimeter. 8 refs., 16 figs.

19267 (ANL-HEP-CP–92-13) **Mechanical design and finite element analysis of the SDC central calorimeter.** Guarino, V. (Argonne National Lab., IL (United States). High Energy Physics Div.); Hill, N.F.; Nasiatka, J.; Hoecker, D.A.; Hordubay, T.D. Scherbarth, D.W.; Swensrud, R.L. Argonne National Lab., IL (United States). High Energy Physics Div. [1992]. 8p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38. (CONF-920331–2: International industrial symposium on the super collider, New Orleans, LA (United States), 4-6 Mar 1992). Order Number DE92011197. Source: OSTI; NTIS; INIS; GPO Dep.

When designing scintillating calorimeters for the study of particle interactions resulting from colliding beams, a primary goal is to instrument 100% of the available solid angle. In pursuit of this goal the challenge for mechanical designers is to minimize the amount of structural mass and still maintain acceptable engineering standards in the design. Argonne National Laboratory, High Energy Physics involvement in the design of a central calorimeter for the SSC started in 1989. Our first proposal was to design a depleted uranium scintillator calorimeter similar to the ZEUS detector presently installed at the HERA electron-proton collider in Hamburg, Germany. Argonne was involved at the time in final assembly of modules for ZEUS that had been designed and constructed at ANL. Due to the cost of using depleted uranium, lead was chosen as the absorber material. In collaboration with Westinghouse Science and Technology Center in Pittsburgh, Pennsylvania was embarked on a program to optimize the use of lead or lead alloys in the construction of the calorimeter. A cast lead design for the calorimeter evolved from this effort. Subsequent to this design, further pressure to reduce costs have now dictated a design which contains lead only in the electromagnetic sections of the calorimeter. The finite element analysis we will present here was done using lead for the HAD1 section of the barrel.

19268 (ANL/HEP/TR–92/06) **On the "massless gap" adjustment of detected energy for passive material in front of a calorimeter.** Trost, H.J. Argonne National Lab., IL (United States). High Energy Physics Div. 31 Jan 1992. 28p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38. (SDC–92-187). Order Number DE92011210. Source: OSTI; NTIS; GPO Dep.

I have designed a correction scheme for energy losses in passive material in front of a calorimeter based on the "massless gap" idea. I use a flexible geometry model of a calorimeter design for SDC outside of a solenoidal coil made of aluminium cylinders of adjustable thickness. The signal from the first radiation length of active calorimetry is scaled dependent on the incoming and observed energies of the shower. A reasonable recovery of the resolution of an unobstructed calorimeter is achieved using correction factors that depend only upon the total thickness of passive material. Thus a useful correction may be built into the hardware by increasing the amount of scintillator in the first radiation length of the active calorimeter. The distribution of correction factors determined event-by-event indicate that an additional dependence on the observed signal in the massless gap and total incident energy is clearly present.

19269 (BARC–1991/E/015) **Development of neutron well coincidence counters for plutonium assay and neutron multiplicity studies.** Dange, S.P. (Bhabha Atomic Research Centre, Bombay (India). Radiochemistry Div.); Datta, T.; Samuel, J.K.; Satya Prakash; Kapoor, S.C.; Vijayan, K.; Dhumwad, R.K. Bhabha Atomic Research Centre, Bombay (India). 1991. 62p. Order Number DE92627003. Source: OSTI; NTIS (US Sales Only); INIS.

The present report describes the fabrication, standardisation and performance evaluation of Neutron Well Coincidence Counters (NWCC) for estimation of plutonium upto Kg level in sealed containments, in finished products of various configurations as well as for neutron multiplicity measurements. The method is based on estimation of even-even plutonium isotopes from coincidence counting of spontaneous fission neutrons using an array of neutron counters in a moderator-housing and a shift-register coincidence logic followed by evaluation of total plutonium content on the basis of known isotopic composition after correction for self multiplication (if any). The method involves use of absolute efficiencies for total and coincidence (fission) neutrons without requiring the repeated calibration procedures for neutron response as a function of plutonium content that depend, in turn, on isotopic composition of plutonium and sample nature. The operating conditions have been optimised after finding experimentally the systems dieaway times and their dependence on the time gatewidth and neutron multiplicity. The range of applicability has been tested by counting several standards sets of PuO_2 samples. Salient features of the NWCC units developed and in regular use are also compared in this report. (author). 14 refs., 9 figs., 15 tabs.

19270 (BNL–47420) **Free ion yields in liquids: Molecular structure and track effects.** Holroyd, R. Brookhaven National Lab., Upton, NY (United States). [1992]. 10p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH00016. (CONF-920480–1: International conference on liquid radiation detectors: their fundamental properties and applications, Tokyo (Japan), 7-10 Apr 1992). Order Number DE92012208. Source: OSTI; NTIS; INIS; GPO Dep.

The signal generated in a liquid-filled ionization chamber is proporational to the ions that escape, the free ion yield or, G_{fi}. Recent results show how molecular structure, rate of energy loss (dE/dx) and pressure affect G_{fi} and give further insight into the ionization process in liquids. As a consequence of the passage of high energy charged particles through a liquid, molecules are ionized and excited. The electrons have kinetic energy initially which allow them to travel some distance away from their geminate cations. The electrons may lose energy to vibrational modes but a significant fraction of the separation occurs while the electrons have subvibrational (near thermal) energy. When the electron finally thermalizes it is within the coulombic field of its parent cation and the two ions constitute a geminate pair. The free ion yield is determined by the fraction of geminate pairs which separate to form free ions as against those that recombine to form excited states.

19271 (BONN-IR–91-72) **Implementation of the forward drift chambers into the first trigger stage of the ZEUS experiment.** Biltzinger, J. Bonn Univ. (Germany). Physikalisches Inst.; Bonn Univ. (Germany). Mathematisch-Naturwissenschaftliche Fakultaet. Dec 1991. 136p. (In German). Order Number DE92511567. Source: OSTI; NTIS (US Sales Only); INIS.

The ZEUS-detector at the electron-proton-collider HERA at DESY in Hamburg is equipped with a three-stage trigger system in order to separate electron-proton-collisions from background events. This paper investigates the rates and properties of the most important sources of background. Interactions of beam protons with the rest gas in the beam pipe cause an activity of 14 kHz in the detector, and interactions of the halo protons with the machine elements contribute an estimated rate of 45 kHz. The major topic of this paper is the integration of the Forward Tracking Devices into the First Level Trigger. The triggers of the Forward and Central Tracking Devices are combined to form the Regional First Level Trigger Box, which in turn is integrated in the Global First Level Trigger Box to perform the final first level trigger decision based on information from the inner tracking, calorimeter, myon chambers, and some veto components. Deep inelastic scattering events with a four-momentum transfer of more than 100 GeV^2/c^2 are recognized very efficiently by a calorimeter stand-alone trigger. On the other hand the inner tracking chambers turn out to be essentially to achieve a high efficiency for photoproduction events. (orig.).

19272 (BONN-IR–92-02) **The central drift chamber of the SAPHIR detector - implementation into the experiment and study of its properties.** Haas, K.M. Bonn Univ. (Germany). Physikalisches Inst.; Bonn Univ. (Germany). Mathematisch-Naturwissenschaftliche Fakultaet. Jan 1992. 136p. (In German). Order Number DE92517030. Source: OSTI; NTIS (US Sales Only); INIS.

At the Bonn accelerator facility ELSA the large solid angle detector SAPHIR was built for the investigation of photon induced reactions. A main component of SAPHIR is the central drift chamber (CDC) matching the magneto gap of $1m^3$. The diameter of the in total 1828 hexagonal drift cells is about 18 mm. The subject of this paper is the implementation of the CDC in the experiment. After the description of the hardware follows the presentation of the software tools for filtering and monitoring the data, which have been developed and tested. An algorithm for extracting the space time relationship is presented. The properties of the chamber with an improved gas mixture (Helium/Neon/Isobutane8 21.25:63.75:15) have been investigated. A spatial resolution of about 200 μm was achieved. The efficiency of the chamber is 97% at a tagged photon of $5x10^4$ per second crossing the chamber. (orig.).

19273 (BONN-IR–92-03) **Development of a FASTBUS data acquisition system for the SAPHIR calorimeter.** Klein, F.J. Bonn Univ. (Germany). Physikalisches Inst.; Bonn Univ. (Germany). Mathematisch-Naturwissenschaftliche Fakultaet. Jan 1992. 78p. (In German). Order Number DE92511566. Source: OSTI; NTIS (US Sales Only); INIS.

Due to the high duty cycle of the new Electron Accelerator at the Physics Institute of Bonn University, ELSA, experiments with tagged photon beams and a large angular acceptance become possible. The new magnetic detector SAPHIR is layed out to detect multi-particle final states with good accuracy, especially a good photon detection capability is designed. Therefore a large electromagnetic calorimeter is built, consisting of 98 modules covering a detection area of about 16 m^2 in forward direction. For this calorimeter a brass-gas-sandwich detector was developed with signal wires perpendicular to the converter planes. The chambers are filled with a standard gas mixture $Ar/CH_4(90:10)$ at atmospheric pressure and operated with a considerably high voltage in the semi-proportional mode. A modified shower counter module, containing 20 μm thick signal wires, was tested at the electron test beam of the Bonn 2.5 GeV electron synchrotron. An energy resolution of $\sigma(E)/E^{*}\sqrt{E(GeV)} = 12.2\pm0.5\%$ was achieved. For data acquisition a modular FASTBUS system was used, which will be installed in the SAPHIR Online Program. (orig.).

19274 (DOE/ER/40125–32) **Central and forward tracking collaboration: Progress report for FY 1991.** Foster, R. (Indiana Univ., Bloomington, IN (United States)); Hanson, G.; Luehring, F.; Luo, X.; Martin, B.; Ogren, H.; Rust, D.R.; Wente, E.; Adrian, B.; Alexander, D.; Ells, F.; Erdos, E.; Ford, W.T.; Johnson, D.; Lohner, M.; Rankin, P.; Schultz, G.; NewcIndiana Univ., Bloomington, IN (United States). 13 Sep 1991. 84p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-84ER40125. Order Number DE92010796. Source: OSTI; NTIS; INIS; GPO Dep.

The goal of this subsystem R&D project is to carry out a detailed study and design of a complete wire chamber tracking system covering pseudorapidity $|\eta| \leq 2.5$ in a solenoidal detector for the SSC. Most of our group are now part of the Solenoidal Detector Collaboration (SDC), so the work has evolved into developing a tracking system conceptual design for the SDC detector. The design discussed in this report uses straw tube drift chambers for the central tracking region. Because of the high rates in the SSC environment, a small cell design is needed for wire chambers in the central region. Straw tubes as small cells offer many advantages because the sense wire is enclosed in a continuous cathode, and the wire tension due to the sense wire only can be supported without a massive structure. The straw tubes are grouped together to form superlayers in order to provide local track segments. The superlayers are composed of modules consisting of about two hundred straw tubes enclosed in a carbon fiber composite shell. Straw tubes have been used in previous experiments for small vertex drift chambers. However, they have never before been used for a large tracking system.

19275 (DOE/ER/40171–4) **Proposal to the Department of Energy for participation in the UA1 experiment.** Rohlf, J.W. Harvard Univ., Cambridge, MA (United States). High Energy Physics Lab. Feb 1988. 21p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG02-84ER40171. Order Number DE92013499. Source: OSTI; NTIS; INIS; GPO Dep.

This proposal is to the Department of Energy for 501.6K dollars (349.6K operations and 152K equipment) for continued participation in the UA1 experiment on proton-antiproton collisions. The UA1 experiment is the study of high-energy proton-antiproton collisions in the Super-Proton-synchrotron (SPS) Collider at CERN. A major upgrade of the UA1 detector is in progress for operation with the upgraded antiproton source (ACOL). The US groups have played an increasingly prominent role in UA1 during the past few years. This paper discusses the data analysis that has been done by the group of the position detector and it's hardware.

19276 (DOE/ER/40452–6) **Particle detection using superfluid helium.** Bandler, S.R.; Lanou, R.E.; Maris, H.J.; More, T.; Porter, F.S.; Seidel, G.M.; Torii, R. Brown Univ., Providence, RI (United States). Dept. of Physics. [1991]. 13p. Sponsored by USDOE, Washington, DC (United States); National Science Foundation, Washington, DC (United States). DOE Contract FG02-88ER40452. (CONF-9109357–1: 6. international workshop on low temperature particle detectors, Oxford (United Kingdom), 5 Sep 1991). Order Number DE92011603. Source: OSTI; NTIS; GPO Dep.

We have observed 5 MeV α particles stopped in volumes-up to two liters of liquid helium at 70 mK. A fraction of the kinetic energy of an α particle is converted to elementary excitations (rotons and phonons), which progagate ballistically in isotopically pure ^{4}He below 0.1 K. Most of these excitations have sufficient energy to evaporate helium atoms on hitting a free surface. The evaporated helium atoms can be detected calorimetrically when adsorbed on a thin silicon wafer ($\sim$1.7 g, 35 cm^{2}) suspended above the liquid. Temperature changes of the silicon are measured with a NTD germanium bolometer. For the geometry studied the observed temperature change of the silicon resulting from an α event in the liquid is approximately 5% of the temperature rise from an α hitting the silicon directly. The implications of these measurements will be discussed as they relate to the possible construction of a large scale detector of solar neutrinos.

19277 (DOE/ER/40670–1) **The Solenoidal Detector Collaboration at the SSCL: Progress report, March 1, 1991–February 29, 1992.** Maryland Univ., College Park, MD (United States). Dept. of Physics and Astronomy. [1992]. 14p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG05-91ER40670. Order Number DE92011941. Source: OSTI; NTIS; INIS; GPO Dep.

Our primary interest is the detection and measurement of muons and the design of the muon detector and trigger for the SDC. We have been concentrating on the design of the forward muon system (in the approximate pseudo-rapidity region of $1.5 <| \eta |<2.5$ corresponding to azimuthal angles of 9.4° to 26. 0°) and at present are responsible for the engineering design of the detector support system in this rapidity region. We are also participating in the development of a liquid argon (LAr) calorimeter adapted to the bunch structure of the SSC machine. At present a LAr calorimeter still remains an option for the choice of calorimetry for the SDC. Recent measurements at BNL in a 20 GeV pion beam confirm that many of the problems associated with long signal collection times of LAr can be solved.

19278 (EGG–10617-3008) **Current status of the associated particle imaging system at STL.** EG and G Energy Measurements, Inc., Las Vegas, NV (United States); Special Technologies Lab., Santa Barbara, CA (United States). 10 Jan 1992. 45p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC08-88NV10617. Order Number DE92011448. Source: OSTI; NTIS; GPO Dep.

This report describes the activities of the Special Technologies Laboratory in developing the technology of associated particle imaging (API). This work has been carried out under the Special Technologies Program of the US DOE Office of Threat Assessment. The report describes the design, development, and fabrication of a small, portable neutron source, the sealed tube neutron generator (STNG), including composition of the software used in the design of the STNG electrodes; the specification, selection, assembly, and testing of the complex data acquisition and logic circuitry; and composition of the extensive software necessary to analyze and compile the copious data, and display them into moving, multi-dimensional images. 20 refs.

19279 (FNAL/C–92/63) **Ideas for a long-baseline neutrino detector.** Bernstein, R. Fermi National Accelerator Lab., Batavia, IL (United States). Feb 1992. 12p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH03000. (CONF-9111141–5: Workshop on long-baseline neutrino oscillations, Batavia, IL (United States), 17-20 Nov 1991). Order Number DE92010650. Source: OSTI; NTIS; INIS; GPO Dep.

The Atmospheric Neutrino Deficit defines a region in Δm^{2}-$\sin^{2}2\theta$ space which ought to be conclusively tested in a long-baseline experiment. This talk sets out a region to cover (which may change as more data is analyzed) and translates that region into an L/E. I present exclusion curves for different experiments based on their distance and their precision; I conclude that an experiment which can detect oscillations down to 1% located at 1200 km will cleanly test the allowed region from Kamioka and IMB. I then describe the techniques which can perform such a measurement and outline both a detector capable of performing such an experiment and some of the systematic problems we might expect.

19280 (FNAL/C–92/66) **Operation and radiation resistance of a FOXFET biasing structure for silicon strip detectors.** Laakso, M. (Fermi National Accelerator Lab., Batavia, IL (United States)); Singh, P.; Engels, E. Jr.; Shepard, P. Fermi National Accelerator Lab., Batavia, IL (United States). Feb 1992. 31p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH03000. (CONF-920299–1: 6. European symposium on semiconductor detectors, Milano (Italy), 24-27 Feb 1992). Order Number DE92011279. Source: OSTI; NTIS; INIS; GPO Dep.

AC-coupled strip detectors biased with a FOXFET transistor structure have been studied. Measurement results for the basic operational characteristics of the FOXFET are presented together with a brief description of the physics underlying its operation. Radiation effects were studied using photons from a ^{137}Cs source. Changes in the FOXFET characteristics as a function of radiation dose up to 1 MRad are reported. Results about the effect of radiation on the noise from a FOXFET biased detector are described. 13 refs.

19281 (FNAL-TM–1770) **Prototype SDC Muon alignment-position monitoring concepts.** Eartly, D. (Fermi National Accelerator Lab., Batavia, IL (United States)); Johnson, P. Fermi National Accelerator Lab., Batavia, IL (United States). 16 Mar 1991. 62p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH03000. Order Number DE92013594. Source: OSTI; NTIS; INIS; GPO Dep.

We have developed and tested some prototype ideas, components, and systems for monitoring the relative planar orientations, spacings between, transverse positions and rotations of the multi Muon supermodule layers in a given SDC Muon chamber projective tower. These are described and parameterized from measurements. Their resolutions are given, and long term stabilities have been determined.

19282 (GKSS–91/E/65) **The feasibility of using a Fourier RTOF spectrometer at a low-power research reactor.** Maayouf, R.M.A. (Nuclear Research Center, Atomic Energy Authority, Cairo (Egypt). Reactor and Neutron Physics Dept.); Priesmeyer, H.G.; Kudryashev, V.A. GKSS-Forschungszentrum Geesthacht GmbH, Geesthacht-Tesperhude (Germany). 1991. 25p. Order Number DE92516930. Source: OSTI; NTIS (US Sales Only); INIS.

The present situation of Fourier time-of-flight (TOF) spectrometry is discussed using the FSS spectrometer as example. The use of the Fourier reverse TOF spectrometry, as an efficient tool for studying condensed matter, at a 2 MW (WWR-S type) reactor is also assessed. The arrangement of the RTOF spectrometer, which could be successfully used at such type of reactor, is introduced. The suggested arrangement applies a neutron guide tube of 24 m length and allows for effective luminosity $2.4.10^6$ at a flight path distance of 3.6 m. The number of neutrons scattered from a sample (5 cm^3 in volume) and incident on the detector system, as estimated for the suggested arrangement, is $\propto 1.6.10^3$ n/sec. Such high counting rate allows to measure a diffraction spectrum within less than an hour. (orig.) With 12 figs.

19283 (GKSS–91/E/82) **High-resolution diffractometer MINI-SFINKS.** Trunov, W.A. (Academy of Sciences, Leningrad (USSR). Inst. of Nuclear Physics); Kudryaschev, W.A.; Uljanov, W.A.; Bulkin, A.P.; Muratov, W.G.; Korotkova, T.K.; Schebetov, A.F.; Hiismaeki, P.; Poeyry, H.; Tiitta, A.; Antson, O.; Mutka, H.; Kukkonen, H. GKSS-Forschungszentrum Geesthacht GmbH, Geesthacht-Tesperhude (Germany). 1991. 58p. Translated from Russian, originally published as report LINP–1277. (In German). Order Number DE92516929. Source: OSTI; NTIS (US Sales Only); INIS.

The theoretical principles of the RTOF (reverse time-of-flight) method as well as the basic equations, the optimization of the neutron guides with Fourier chopper and the time-focussing detector setup are outlined. The powder diffractometer is described and some experimental results are given. The report was used as conceptual design basis for the FSS spectrometer at FRG-1 (GKSS Research Center) which has been optimized for non-destructive determination of residual stress. (orig.) With 18 figs., 3 tabs.

19284 (GSI–92-05) **Study of the momentum loss achromate and its application to the measurement of the *β*-delayed neutron radioactivity of ^{14}Be, ^{17}B, and ^{19}C.** Hanelt, E. Gesellschaft fuer Schwerionenforschung mbH, Darmstadt (Germany); Technische Hochschule Darmstadt (Germany). Fachbereich 5 - Physik. Feb 1992. 182p. (In German). Order Number DE92517027. Source: OSTI; NTIS (US Sales Only); INIS.

In this thesis it was shown that the projectile fragmentation at relativistic projectile velocities is a production mechanism for exotic nuclei, which is because of its advantageous kinematics especially suited for the fast and efficient separation of the reaction product in an ion optical system. An essential result of these studies is that projectile fragments can be separated in a wide energy range from about 100 MeV/nucleon to 1 GeV/nucleon and over the whole mass range by means of a momentum-loss achromate. In the experiment described in this thesis this method was for the first time applied to the measurement of the *β*-deLayed neutron radioactivity. The studied isotopes $^{-}1^{-}4$Be, $^{-}1^{-}7$B, and $^{-}1^{-}9$C were produced by the fragmentation of a $^{-}2^{-}2$Ne beam at 60 MeV/nucleon. A measurement of *β* half-lifes and neutron branching ratios was performed, the accuracy of which was in other experiments with similarly exotic nuclei hitherto hardly reached. In $^{-}1^{-}7$B thereby for the first time a *β*-delayed 4-neutron radioactivity could be detected. The results of these measurements were compared with calculations from different theoretical models. The observed multiplicities of the *β*-delayed neutrons are consistent with the multiplicities, which are expected by means of a comparison of the $Q_{-}\beta$ values and the neutron binding energies. The measured neutron branching ratios yield indirect information on distribution of the *β* strength in the daugther nuclei. At time none of the theories is yet able to reproduce these experimental values in sufficient way. (orig./HSI).

19285 (INFN-LNF–91-061(R)) **High-resolution, low-energy e.m. Pb-SCIFI calorimetry: An investigation on fibres and tests on photon beam with low-energy photons.** Bianco, S. (Istituto Nazionale di Fisica Nucleare, Frascati (Italy). Lab. Nazionale di Frascati); Casaccia, R.; Daniello, L.; Fabbri, F.L.; Giardoni, M.; Zallo, A.; Lindozzi, M.; Passamonti, L.; Russo, V.; Sarwar, S.; Votano, L.; Mertzog, D.; Hughes, S.; RIstituto Nazionale di Fisica Nucleare, Rome (Italy). 1991. 9p. (CONF-9105338–: 5. Meeting on advanced detectors, La Biodola (Italy), 26-31 May 1991). Order Number DE92626995. Source: OSTI; NTIS (US Sales Only); INIS.

This article reports on studies aimed to characterise the properties of plastic scintillating fibres to be used in head-on, 1:1 Pb-SCIFI calorimetric modules. The effect of glue on the attenuation of the light transported by cladding close to the photomultiplier tube is studied and found to effectivaly decrease the contribution of cladding light. Pb-SCIFI modules have been assembled and tested on a 20-80 Mev tagged photon beam. Good linearity and energy resolution better than $6\%/\sqrt{E[GeV]}$ were achieved, therefore showing that this technique is suitable for experimental at *ϕ*-factories.

19286 (INFN-LNF–91-062(R)) **The S.C.I.C. detector: an unconventional design for the detection of low-energy (200-300)MeV photons.** Bianco, S. (Istituto Nazionale di Fisica Nucleare, Frascati (Italy). Lab. Nazionale di Frascati); Casaccia, R.; Fabbri, F.L.; Giardoni, M.; Passamonti, L.; Russo, V. Istituto Nazionale di Fisica Nucleare, Rome (Italy). 1991. 7p. (CONF-9105338–: 5. Meeting on advanced detectors, La Biodola (Italy), 26-31 May 1991). Order Number DE92626996. Source: OSTI; NTIS (US Sales Only); INIS.

The simulated performances of a non-homogeneous e.m. calorimeter based on a 5 X tracking section using CsI(Tl) fibres, followed by a 10 X_0Pb-SCIFI head-on back section are reported. The study shows that such a technique is quite promising for the high-efficiency detection of photons in the energy range of interest at a *ϕ*-factory machine.

19287 (INFN-TC–91-05) **Design of a reflex time-of-flight mass spectrometer for the study of the desorption of molecular ions.** Riggi, F. (Istituto Nazionale di Fisica Nucleare, Catania (Italy)). Istituto Nazionale di Fisica Nucleare, Rome (Italy). 1991. 9p. Order Number DE92626979. Source: OSTI; NTIS (US Sales Only); INIS.

A reflex time-of-flight mass spectrometer for the study of the desorption and dissociation of molecular ions has been designed. A general overview of the instrument is reported, together with the different experimental aspects of the technique. These include mechanical and vacuum solutions, secondary ion optics in the electrostatic mirror, electronics, data acquisition and analysis.

19289 (INIS-mf–13179, pp. 198-208) **Heavy ion reaction analyzer facility (HIRA) at NSC.** Sinha, A.K. (Nuclear Science Centre, New Delhi (India)). Department of Atomic Energy, Bombay (India). Board of Research in Nuclear Physics. 1991. 310p. (CONF-9012123–: DAE symposium on nuclear physics, Madras (India), 1-4 Dec 1990). In *Proceedings of the symposium on nuclear physics (held at Madras during December 1-4 1990): Invited talks/seminars. Vol. 33A (1990).* Order Number DE92001359. Source: OSTI; NTIS (US Sales Only); INIS.

A recoil mass separator facility HIRA is being set up by the scientists from Nuclear Science Centre (NSC), Delhi and the universities in order to exploit the full potential of the research with the heavy ion beams from the Pelletrons at NSC. It is in an advanced stage of installation. The electromagnetic configuration selected for HIRA is QQEMEQQ. The combination EME of electrostatic (E) and magnetic (M) deflectors is chosen so as to ensure reasonable mass dispersion along with achieving a X-(horizontal displacement) and O (horizontal divergence) focus in energy. In addition to the enhancement in the solid angle of acceptance, the two quadrupole-doublets provide for a lower Y-magnification, a variable mass dispersion and possibility of incorporating suitable higher order fields for correction of some aberrations etc. A multipole magnet is also included before the magnetic dipole to provide for a fine tuning of the HIRA. In some of the experiments planned, it is required to set HIRA at angles different from the normally used zero degree direction. To take care of this, HIRA will be mounted on a rotatable platform and coupled to the beam line with a sliding seal vacuum chamber. (author). 3 refs., 1 tab.

19290 (INIS-mf–13179, pp. 187-197) **SHRI: separator for heavy recoil ions: A recoil mass spectrometer for Bombay pelletron.** Singh, P. (Bhabha Atomic Research Centre, Bombay (India). Nuclear Physics Div.). Department of Atomic Energy, Bombay (India). Board of Research in Nuclear Physics. 1991. 310p. (CONF-9012123–: DAE symposium on nuclear physics, Madras (India), 1-4 Dec 1990). In *Proceedings of the symposium on nuclear physics (held at Madras during December 1-4 1990): Invited talks/seminars. Vol. 33A (1990).* Order Number DE92001359. Source: OSTI; NTIS (US Sales Only); INIS.

The recoil mass spectrometer, SHRI, designed for use with the 14UD BARC-TIFR Pelletron is now under fabrication. The spectrometer consists of a combination of electric and magnetic fields in QQEBE configuration. The mirror symmetric 3-dipole system allows energy dispersionless focussing on the detector. Maximum attainable electric and magnetic rigidities have been chosen considering the various target-projectile combinations planned for the Pelletron accelerator. The design studies indicate that a mass dispersion of 11 mm/% and mass resolving power of >300 are feasible at a maximum solid angle of 8 msr. The present status of the spectrometer and planned experiments are reviewed. (author). 14 refs., 4 figs., 1 table.

19291 (INIS-mf–13179, pp. 242-258) **Barium fluoride: a new scintillation detector material.** Chougaonkar, M.P. (Bhabha Atomic Research Centre, Bombay (India). Technical Physics and Prototype Engineering Div.); Gokhale, V.H.; Rao, S.M.D.; Srikantiah, R.V. Department of Atomic Energy, Bombay (India). Board of Research in Nuclear Physics. 1991. 310p. (CONF-9012123–: DAE symposium on nuclear physics, Madras (India), 1-4 Dec 1990). In *Proceedings of the symposium on nuclear physics (held at Madras during December 1-4 1990): Invited talks/seminars. Vol. 33A (1990).* Order Number DE92001359. Source: OSTI; NTIS (US Sales Only); INIS.

Barium fluoride exhibits at least two light output components. A fast component appears with low intensity at 220nm with decay constant of 0.6ns, while the slow one appears with comparatively more intensity at 310 nm with a decay constant of 600 ns. This property of the material can be exploited for the measurement of both energy as well as timing spectroscopy. BARC has been actively involved in the growth and characterisation of barium fluoride crystals during past few years. Crystals measuring 40 mm dia and 30 mm long have been grown in the high temperature high vacuum furnace using Bridgmann technique. The crystals grown have been characterised for impurity analyses, UV transmission and gamma ray spectra measurements. Improvement in the transmission in the UV region, scintillation characteristics, are the areas in which the work is being carried out. It is also being planned to shift the scintillation wavelength to the near visible range so that more conventional PMTs can be used. (author). 20 refs., 3 tabs.

19292 (INIS-mf–13179, pp. 231-241) **New trends in the growth of scintillation detector crystals.** Arivuoli, D. (Anna Univ., Madras (India). Crystal Growth Centre); Kumar, J.; Ramaswamy, P. Department of Atomic Energy, Bombay (India). Board of Research in Nuclear Physics. 1991. 310p. (CONF-9012123–: DAE symposium on nuclear physics, Madras (India), 1-4 Dec 1990). In *Proceedings of the symposium on nuclear physics (held at Madras during December 1-4 1990): Invited talks/seminars. Vol. 33A (1990).* Order Number DE92001359. Source: OSTI; NTIS (US Sales Only); INIS.

A review has been given regarding the growth of different scintillators comprising organic, inorganic and plastic materials. For the scintillator crystal to have high efficiency, it should possess high density, high physical efficiency (fraction of absorbed energy transformed to light should be large), low opacity to its own emission, short decay time and extremely small afterglow. All these factors depend upon the perfection (purity, dislocation) of the crystal and in certain cases, activator concentration. The different crystal growth techniques (like melt, vapour, and solution) adopted are discussed in terms of their impurity content (activator), detection efficiency and spectral resolution. Results on currently used scintillators like BGO and BSO grown both by Czochralski and travelling solvent zone apparatus are presented. The role played by stoichiometry and convective flow during growth is also presented. The advantages of these crystals over other scintillation detectors are discussed. (author). 5 refs., 3 tabs.

19293 (INIS-mf–13179, pp. 221-230) **Gamma detector array facility at Nuclear Science Centre.** Bhowmik, R.K. (Nuclear Science Centre, New Delhi (India)). Department of Atomic Energy, Bombay (India). Board of Research in Nuclear Physics. 1991. 310p. (CONF-9012123–: DAE symposium on nuclear physics, Madras (India), 1-4 Dec 1990). Source: OSTI; NTIS (US Sales Only); INIS.

A Gamma Detector Arrays (GDA) facility being set up at the Nuclear Science Centre, Delhi is described. It will be used to study nuclear shapes at high spin, measurement of lifetimes and g-factors of high spin states and study of nuclei far from stability. (author). 6 figs.

19294 (INIS-mf–13179, pp. 209-220) **Gamma ray multiplicity set up at the BARC/TIFR 14UD pelletron accelerator.** Choudhary, R.K. (Bhabha Atomic Research Centre, Bombay (India). Nuclear Physics Div.). Department of Atomic Energy, Bombay (India). Board of Research in Nuclear Physics. 1991. 310p. (CONF-9012123–: DAE symposium on nuclear physics, Madras (India), 1-4 Dec 1990). In *Proceedings of the symposium on nuclear physics (held at Madras during December 1-4 1990): Invited talks/Seminars. Vol. 33A (1990).* Order Number DE92001359. Source: OSTI; NTIS (US Sales Only); INIS.

Angular momentum plays an important role in the characterisation of heavy ion reaction processes. Gamma ray multiplicity measurements provide a unique method for the determination of the angular momentum of nuclei produced in heavy ion reactions, and have been used to study the angular momentum distributions in different reaction channels such as transfer, deep inelastic and fusion processes, which have helped in a better understanding of the various aspects of the reaction mechanism in heavy ion collisions. A gamma ray multiplicity array at the BARC/TIFR 14UD pelletron, consisting of a number of hexagonal BGO detector elements has been set up. The salient features of the multiplicity set up, the theory of the measurements and the results obtained from the first experiments using this set up are dealt with. (author). 14 refs., 5 figs.

19314 (INIS-SU–308/A, pp. 27-31) **Capabilities of a position-time spectrometer for determining antineutrino rest mass from the ^{3}H beta spectrum.** Babenkov, M.I. (AN Kazakhskoj SSR, Alma-Ata (USSR). Inst. Yadernoj Fiziki); Zhdanov, V.S. AN Litovskoj SSR, Vilnius (USSR). Inst. Fiziki; AN SSSR, Moscow (USSR). Nauchnyj Sovet po Yadernoj Spektroskopii. 1990. 168p. (In Russian). (CONF-9006411-: 8. seminar on precise measurements in nuclear spectroscopy, Uzhgorod (USSR), 12-13 Jun 1990). In *Precision problems in nuclear spectroscopy: 1990.* Order Number DE92001356. Source: OSTI; NTIS (US Sales Only); INIS.

A possibility of improving the background conditions in tritium experiments is considered. An experiment on determining the rest mass of antineutrino from tritium beta spectrum is supposed to be conducted on the position-time spectrometer (PTS) under construction. The experiment scheme is presented. The PTS provides for an energy resolution typical of similar experiments (40-50 eV) at the tritium beta spectrum boundary. 11 refs.; 3 figs.

19315 (INIS-SU–308/A, pp. 32-36) **$\pi\sqrt{2}$ magnetic high-resolution beta spectrometer with a position sensitive detector.** Mitrokhovich, N.F. (AN Ukrainskoj SSR, Kiev (Ukraine). Inst. Yadernykh Issledovanij); Sidorenko, L.P. AN Litovskoj SSR, Vilnius (USSR). Inst. Fiziki; AN SSSR, Moscow (USSR). Nauchnyj Sovet po Yadernoj Spektroskopii. 1990. 168p. (In Russian). Source: OSTI; NTIS (US Sales Only); INIS.

Multichannel methods for measuring electron spectra using a high resolution $\pi\sqrt{2}$ spectrometer (ρ=50 cm), based on applying a position-sensitive detector (PSD) in its focal plane, are described. The position-sensitive system is formed by a chevron assembly of microchannel plates (43x63 mm^2, channel diameter - 10 μm, caliber - 80) together with an electromagnetic delay line, measurement of a position spectrum is realized according to the time method applying the time-amplitude converter and a 256-channel analyser. According to the data obtained, the accuracy of measuring the intensities of lines falling within PSD capture range, makes up 2%. The accuracy of determining the relative intensities of lines remote from each other by the energy is worse, but proceeding from the course of the efficiency curve measured, it does not exceed 5%. 3 refs.; 3 figs.

19316 (INIS-SU–308/A, pp. 37-42) **Multichannel beta spectrometer with a position-sensitive detector based on microchannel plates.** Abdurazakov, A.A. (CONF-9006411–: 8. seminar on precise measurements in nuclear spectroscopy, Uzhgorod (USSR), 12-13 Jun 1990). In *Precision problems in nuclear spectroscopy: 1990.* Order Number DE92001356. Source: OSTI; NTIS (US Sales Only); INIS.

A beta spectrometer with a constant magnetic field is described. To increase the luminosity and sensitivity the detection system is based on microchannel plates (MCP). Application of MCP increases the electron recording efficiency which allows one to use the advantages of a magnetic spectrograph in experiments on-line with mass-separators of the accelerators to study the short-living nucleus internal conversion electron spectra. 3 refs.; 4 figs.

19317 (INIS-SU–308/A, pp. 21-26) **Position-sensitive detectors in charged-particle spectrometry.** Babenkov, M.I. (AN Kazakhskoj SSR, Alma-Ata (USSR). Inst. (CONF-9006411–: 8. seminar on precise measurements in nuclear spectroscopy, Uzhgorod (USSR), 12-13 Jun 1990). In *Precision problems in nuclear spectroscopy: 1990.* Order Number DE92001356. Source: OSTI; NTIS (US Sales Only); INIS.

Application of position-sensitive detectors in beta-spectroscopy is briefly discussed. Application of three types of detectors is considered: proportional chambers (counters), solid semiconductor counters and detectors with microchannel plates. 12 refs.; 2 figs.

19318 (ISN–91-55) **Beam Cherenkov counter conception for in line identification of 270 GeV/c Σ^- Ξ^- and Ω^-.** Touillon, R. Grenoble-1 Univ., 38 (France). Inst. des Sciences Nucleaires; Grenoble-1 Univ., 38 (France). Jun 1991. 170p. (In French). Order Number DE92517865. Source: OSTI; NTIS (US Sales Only); INIS.

The purpose of this thesis is to design a beam Cerenkov counter. This counter will provide an on line identification of the Σ^-, Ξ^- and Ω^- hyperons (270 GeV/c) in the experiment WA89 at CERN. The acceptance of the detector should allow tagging these hyperons in a large momentum range (± 25%) and for a beam divergence up to 250 microrad. The first part of this report is devoted to the physical goals such as the study of charmed baryons, the search of multiquark states, and the determination of hadronic and electromagnetic hyperon radii. The experimental WA89 setup is also presented. The major part deals with the design of the Cerenkov counter. The dimension of the detector, the Cerenkov angle value, the focal length of the spherical mirror, etc... are derived from a Monte-Carlo simulation. Various methods of simple photon detection (gaz detector: TEA, TMAE; solid detectors: PM and Image Intensifier) are investigated. The most performing solution uses two conical mirrors in order to reduce the size of the Cerenkov circles and an image intensifier (which detects the single photon) followed by an optical fiber matrix transmitting the luminous signal to 160 photomultipliers. The on line procedure for calculating the radius of each circle (identification of the particle) is studied in detail. Finally, the optimization of the optical system to achromatize the Cerenkov light is discussed.

19319 (KEK-PROC–91-8, pp. 61-83) **Search for neutralinos in the Z^0 decay at LEP.** Hidaka, K. (Tokyo Gakugei Univ., Koganei (Japan)); Ratcliffe, P. National Lab. for High Energy Physics, Tsukuba, Ibaraki (Japan). Oct 1991. (CONF-9008241–: KEK summer institute on high energy phenomenology, Tsukuba (Japan), 21-25 Aug 1990). In *Proceedings of the KEK summer institute on high energy phenomenology.* 145p. Order Number DE92782188. Source: OSTI; NTIS (US Sales Only); INIS.

We investigate neutralino production process $e^- e^+ \to Z^0 \to z_k\ z_{k'}$ at the Z^0 peak. Recent LEP and SLC data on Z^0 decays (such as total and invisible width of Z^0 and unsuccessful searches for chargino pairs and acoplanar charged lepton pairs and jet pairs) and the gluino search experiments at S(p-bar)pS and TEVATRON significantly constrain the mass matrix parameters of chargino and neutralino sectors. We find that despite these constraints there still remains a sizable 'window' in the parameter space really open for discovering neutralinos in the Z^0 decay at LEP. Encouraged by this observation we evaluate the event distributions for the detected particles in this process. The information these can provide would be valuable in identifying this production mechanism and the new particles responsible for it, including their spins, masses and couplings. (author).

19320 (LA–12237-MS) **Capability and limitation study of the DDT passive-active neutron waste assay instrument.** Nicholas, N.J.; Coop, K.L.; Estep, R.J. Los Alamos National Lab., NM (United States). May 1992. 58p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. Order Number DE92011758. Source: OSTI; NTIS; INIS; GPO Dep.

The differential-dieaway-technique passive-active neutron assay system is widely used by transuranic waste generators to certify their drummed waste for eventual shipment to the Waste Isolation Pilot Plant (WIPP). Stricter criteria being established for waste emplacement at the WIPP site has led to a renewed interest in improvements to and a better understanding of current nondestructive assay (NDA) techniques. Our study includes the effects of source position, extreme matrices, high neutron backgrounds, and source self-shielding to explore the system's capabilities and limitations and to establish a basis for comparison with other NDA systems. 11 refs.

19321 (LA–12277-MS) **Simulation of backscatter imaging.** Atwater, H.F.; Morris, R.A. Los Alamos National Lab., NM (United States). Apr 1992. 9p. Sponsored by Department of Defense, Washington, DC (United States). DOE Contract W-7405-ENG-36. Order Number DE92010927. Source: OSTI; NTIS; GPO Dep.

Frequently during remodeling or modifications of existing buildings, it is necessary to know that exact location of various utility lines (such as water or sewer and electrical conduit) before drilling holes in floors and walls. In many cases conventional radiography or metal detectors may be used to map out the lines, but occasionally a one-sided inspection is required deep within concrete or brick. The purpose of this work was to explore the feasibility of using the backscattered radiation from a high-energy bremsstrahlung beam to detect the existence of a void in construction material. If the focal point of the detector collimator is centered on the void, the backscattered signal should be slightly different than from adjacent regions. By using the MCNP (Monte Carlo Neutron Photon) code to simulate the inspection, we can identify fundamental limitations of the technique as well as estimate design parameters of a practical system. This will reduce the time, effort, and expense for any subsequent experimental program to develop the technique. Our basic approach to the simulation was to keep the geometry as simple as possible but still realistic. The radiation source was a simulated 6-MeV bremsstrahling spectrum from a commercially available linac that is relatively small, portable, and can produce an output of 300 rad/min at 1 m. All shielding is assumed to be tungsten. The object being inspected is assumed to be a semi-infinite slab of homogenized concrete. Our "concrete" has the correct proportions of elements and the correct density, but none of the inhomogeneities caused by sand and aggregate in real concrete. The errors caused by this assumption will be discussed later. The nominal void we are trying to detect is air-filled sphere, 2.54 cm in diameter. We also assumed that the maximum depth of the void would be 45.72 cm. 2 refs.

19322 (LAL-RT–90-06) **Front-end electronics for H.E.P.** Hrisoho, A. Paris-11 Univ., 91 - Orsay (France). Lab. de l'Accelerateur Lineaire. Jul 1990. 34p. (CONF-9007244–: 3. ICFA

School on Instrumentation in Elementary Particle Physics, Rio de Janeiro (Brazil), 16-28 Jul 1990). Order Number DE92517870. Source: OSTI; NTIS (US Sales Only); INIS.

A simplified description of the front-end electronics used for High Energy Physics Detectors is given. A brief analysis of the speed limitation due to the time necessary for the detector charge transfer is given, which depends as well of the detector behaviour as of the preamplifier configuration. A description of the sample electronic circuits like differentiation, integration, pole zero circuit and preamplifier are given. Noise analysis is carried out to derive the relations for the equivalent noise signal for the measuring device with some description of practical noise measuring. The shaping of the signals to obtain an optimization for the noise is considered and some hints for shaping amplifier design, with a description of the noise weightling function for normal and time variant shaping are given.

19323 (LA-UR–92-764) **A new radiometer for earth radiation budget studies.** Weber, P.G. Los Alamos National Lab., NM (United States). [1992]. 4p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-9205136–1: 1992 international geoscience and remote sensing symposium, Houston, TX (United States), 26-29 May 1992). Order Number DE92011267. Source: OSTI; NTIS; GPO Dep.

A critical need for the US Global Change Research Program is to provide continuous, well-calibrated radiometric data for radiation balance studies. This paper describes a new, compact, relatively light-weight, adaptable radiometer which will provide both spectrally integrated measurements and data in selected spectral bands. The radiometer design is suitable for use on (small) satellites, aircraft, or Unmanned Aerospace Vehicles (UAVs). Some considerations for the implementation of this radiometer on a small satellite are given. 17 refs.

19324 (LA-UR–92-936) **The Solenoidal Detector Collaboration silicon detector system.** Ziock, H.J.; Gamble, M.T.; Miller, W.O.; Palounek, A.P.T.; Thompson, T.C. Solenoidal Detector Collaboration. Los Alamos National Lab., NM (United States). [1992]. 9p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-920331–3: International industrial symposium on the super collider, New Orleans, LA (United States), 4-6 Mar 1992). Order Number DE92011237. Source: OSTI; NTIS; INIS; GPO Dep.

Silicon tracking systems will be fundamental components of the tracking systems for both planned major SSC experiments. Despite its seemingly small size, it occupies a volume of more than 5 meters in length and 1 meter in diameter and is an order of magnitude larger than any silicon detector system previously built. This report discusses its design and operation.

19325 (LBL–31596) **Properties of CMOS devices and circuits fabricated on high-resistivity, detector-grade silicon.** Holland, S. Lawrence Berkeley Lab., CA (United States). Nov 1991. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC03-76SF00098. (CONF-911106–93: IEEE nuclear science symposium, Santa Fe, NM (United States), 5-9 Nov 1991). Order Number DE92011727. Source: OSTI; NTIS; INIS; GPO Dep.

A CMOS process that is compatible with silicon p-i-n radiation detectors has been developed and characterized. A total of twelve mask layers are used in the process. The NMOS device is formed in a retrograde well while the PMOS device is fabricated directly in the high-resistivity silicon. Isolation characteristics are similar to a standard foundary CMOS process. Circuit performance using 3 μm design rules has been evaluated. The measured propagation delay and power-delay product for a 51-stage ring oscillator was 1.5 ns and 43 fJ, respectively. Measurements on a simple cascode amplifier results in a gain-bandwidth product of 200 MHz at a bias current of 15 μA. The input-referred noise of the cascode amplifier is 20 nV/$\sqrt{}$Hz at 1 MHz.

19326 (MPI-PhE–91-06) **Measurement of the position resolution of two-side readable silicon strip detectors with VLSI electronics.** Bauer, C. Max-Planck-Institut fuer Physik, Muenchen (Germany). Werner-Heisenberg-Institut; Technische Univ. Muenchen, Garching (Germany). Fakultaet fuer Physik. Nov 1991. 86p. (In German). Order Number DE92516647. Source: OSTI; NTIS (US Sales Only); INIS.

The two-side readable silicon strip detectors of the MPI-TU-MBB design were tested in connection with the VLSI electronics developed for this in a particle beam. By means of the data taken in an electron beam (50 GeV) and subsequently prepared by an especially developed procedure following studies were performed: the distribution of the energy loss of minimally ionizing particles in silicon was determined. The correlation between the signal-pulse heights of the two detector sides was measured. The signal-to-noise ratio was determined from the distribution of the energy loss. As essential factor for the reachable position resolution the shape of the signal charge distribution was studied. As consequence of the capacitative charge distribution charge losses between the strips occur. The influence of δ electrons on the width of the charge distribution and the reachable position resolution was detected. The dependence of the mean energy loss and the width of the charge distribution on the incident angle of the particle was determined. As essential result of this test the position resolution of both sides of these detectors was determined. The values, measured for this amount to 11.6 μm on the ϕ side and 15.7 μm on the z side. The angular dependence of the position resolution of the ϕ side was studied. The test in the particle beam yielded also some results, which make future studies necessary: The measurement have yielded differences in the position resolution of the two sides, which can only be partly explained by the geometry of the two detector sides. The position resolution is at-the-whole bader than expected. On both sides losses in signal charge occur. The signal-pulse heights of the ϕ side are lower than the corresponding signal-pulse heights of the z side. (orig./HSI).

19327 (OUP–92-02) **CHICSI - a proposal for a multidetector ΔE-E particle telescope.** Guttormsen, M. (ed.). Oslo Univ. (Norway). Fysisk Inst. Jan 1992. 21p. Order Number DE92628293. Source: OSTI; NTIS (US Sales Only); INIS.

The aim of the CHICSI project is to build a silicon ΔE-E telescope system for the measurement of charged ejectiles produced in violent heavy ion collisions. Of particular interest is the detection of intermediate mass fragments in order to investigate the behavior of nuclear matter under extreme conditions. The report is a first attempt to determine the design parameters of the multidetector system CHICSI. The detector is intended to be used for experiments at the CELSIUS storage ring. Thus, the operation in a storage ring environment requires special attention to the ultra high vacuum condition and target arrangements. The multidetector system will be operated in conjunction with other detector systems as the slow heavy ion recoil detector. 11 refs., 9 figs., 3 tabs.

19328 (PCCF-RI–91-04) **A dilepton spectrometer project for SIS.** Meritet, L. Clermont-Ferrand-2 Univ., 63 - Aubiere (France). Lab. de Physique Corpusculaire. 1991. 10p. (CONF-910396–: 1. European biennial workshop on nuclear physics, Megeve (France), 25-29 Mar 1991). Order Number DE92517869. Source: OSTI; NTIS (US Sales Only); INIS.

We present an experimental project to study e^+e^- pairs production in nucleus-nucleus collisions at GSI. Dileptons appear to be a clean probe to investigate in medium properties of nuclear form factors, baryon excitations (Δ) and mesons (π-dispersion relation; ρ-form factor) at high nuclear matter densities. The design of the detector system will be based on the experience obtained with the DLS-spectrometer at LBL and other dilepton detector systems in operation at high energy facilities. The project includes a fast electron trigger provided by a ring imaging Cherenkov detector with a segmented photomultiplier array.

19329 (PCCF-RI–91-07) **Field assisted photoemission by silicon photocathodes.** Aboubacar, A. (Clermont-Ferrand-2 Univ., 63 - Aubiere (FR). Lab. de Physique Corpusculaire); Dupont, M.; El Manouni, A.; Querrou, M.; Says, L.P.; Fabre, N.; Rossel, F. Clermont-Ferrand-2 Univ., 63 - Aubiere (France). Lab. de Physique Corpusculaire. 1991. 13p. Order Number DE92517868. Source: OSTI; NTIS (US Sales Only); INIS.

Silicon photocathodes with arrays of tips have been prepared using microlithographic techniques. Current emission due to field effect has been measured in the case of heavy and weakly doped boron Silicon. An Argon continuous laser has been used to produce photocurrent. An instantaneous current (600 μA) with a moderate laser power (83 mW), has been produced on weakly doped photocathodes. This current corresponds to an average quantum yield (purely photoelectric) of about 1.7%, and a local current density in the range of a few 10^6 A m^{-2}.

19330 (PEL–306) **Characterization of the Schlumberger borehole gammametric system.** Prozesky, V.M.; Franklin, C.B. Atomic Energy Corp. of South Africa (Pty) Ltd., Pretoria (South Africa). Feb 1991. 19p. Order Number DE92626985. Source: OSTI; NTIS (US Sales Only); INIS.

The expertise and equipment for γ-ray spectroscopy at the Nuclear Beam Technology group at Pelindaba was used to characterise a Schlumberger NaI-γ-ray detector. The detector is fitted in a drilling housing; and can be lowered down boreholes to trace radioactive or activated elements. This detector is specifically used for prospecting purposes, studying the γ-rays that accompany the presence of mining minerals. The problem of inconsistent results at high count rates was characterised, and the shift in amplifier gain was determined as a function of total count rate. The performance of the software to strip the elements of the spectrum was also checked and found to fail at count rates of 20 kHz and higher. The stabilisation circuit was found to become less effective already at moderate count rates ($\simeq$ 5kHz). The experiment was performed by comparing the count rate in five energy windows between the Schlumberger γ-ray detector and a Ge(Li) solid state γ-ray detector, where the lower efficiency and detection characteristics of this detector provided a reliable reference. The problem was largely solved by introducing lead shielding to allow the unit to stabilise itself more effectively at high count rates. With the addition of 3 mm lead shielding, the acceptable count rate was improved by a factor 2. 8 figs., 1 tab., 4 refs.

19331 (PHE–91-015) **The construction and performance of a large cylindrical wire chamber with cathode readout.** Deiters, K.; Donat, A.; Friebel, W.; Heller, R.; Kirsch, S.; Krankenhagen, R.; Lange, W.; Leiste, R.; Lohmann, W.; Lustermann, W.; Peng, Y.; Roeser, U.; Tonisch, F.; Trowitzsch, G.; Vogt, H.; Wilhelmi, M. Institut fuer Hochenergiephysik, Zeuthen (Germany). Dec 1991. 20p. Order Number DE92517038. Source: OSTI; NTIS (US Sales Only); INIS.

The construction and performance of two large coaxial cylindrical multiwire proportional chambers with cathode readout, denoted as Z-Detector, forming the outer part of the L3 central tracking detector, are described. Three self supporting cylinders of about 1 m length and 1 m diameter, constructed as a sandwich of Kapton foil and foam, form the mechanical frame. It represents 2% of a radiation length. In each chamber one cathode layer is subdivided in helical strips and the other one in rings. The readout of the charges induced on the cathode strips and the other one in rings. The readout of the charges induced on the cathode strips provides the avalanche position along the beam (z-) direction. The detector has been running in the L3 experiment at LEP for nearly two years. The resolution of the z-measurement is 320 μm, the double track resolution is about 10 mm. The efficiency of each chamber is 96%. (orig.).

19332 (PNL-SA–19981) **Use of tissue equivalent proportional counters to characterize radiation quality on the space shuttle.** Braby, L.A.; Conroy, T.J.; Elegy, D.C.; Brackenbush, L.W. Pacific Northwest Lab., Richland, WA (United States). Apr 1992. 7p. Sponsored by National Aeronautics and Space Administration, Washington, DC (United States). DOE Contract AC06-76RL01830. (CONF-920431–24: Meeting on new horizons in radiation protection and shielding, Pasco, WA (United States), 26 Apr - 1 may 1992). Order Number DE92012347. Source: OSTI; NTIS; INIS; GPO Dep.

Tissue equivalent proportional counters (TEPC) are essentially cavity ionization chambers operating at low pressure and with gas gain. A small, battery powered, TEPC spectrometer, which records lineal energy spectra at one minute intervals, has been used on several space shuttle missions. The data it has collected clearly show the South Atlantic anomaly and indicate a mean quality factor somewhat higher than expected. An improved type of instrument has been developed with sufficient memory to record spectra at 10 second intervals, and with increased resolution for low LET events. This type of instrument will be used on most future space shuttle flights and in some international experiments.

19333 (SLAC-PUB–5745) **Studies of helium based drift chamber gases for high-luminosity low energy machines.** Boyarski, A. (Stanford Linear Accelerator Center, Menlo Park, CA (United States)); Briggs, D.; Burchat, P.R. Stanford Linear Accelerator Center, Menlo Park, CA (United States). Feb 1992. 9p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC03-76SF00515 ;AM03-76SF00010. (CONF-920219–1: 6. international wire chamber conference: wire chambers - recent trends and alternative techniques, Vienna (Austria), 17-21 Feb 1992). Order Number DE92012415. Source: OSTI; NTIS; INIS; GPO Dep.

Future high luminosity low energy machines will need low mass tracking chambers to order to minimize multiple scattering of the relatively low momentum tracks produced at these facilities. A drift chamber using a helium based gas rather than a conventional argon based gas would greatly reduce the amount of multiple scattering. This paper summarizes measurements of the drift velocity and position resolution for gas mixtures of helium with CO_2 and isobutane and helium with DME. Good spatial resolutions are obtained. A design of a drift chamber with only 0.12% of a radiation length (gas plus wire) over a 60 cm tracking distance is presented.

19334 (SLAC-PUB–5793) **Wire chamber gases.** Va'vra, J. Stanford Linear Accelerator Center, Menlo Park, CA (United States). Apr 1992. 26p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC03-76SF00515. (CONF-920219–2: 6. international wire chamber conference: wire chambers - recent trends and alternative techniques, Vienna (Austria), 17-21 Feb 1992). Order Number DE92012421. Source: OSTI; NTIS; INIS; GPO Dep.

In this paper, we describe new developments in gas mixtures which have occurred during the last 3–4 years. In particular, we discuss new results on the measurement and modeling of electron drift parameters, the modeling of drift chamber resolution, measurements of primary ionization and the choice of gas for applications such as tracking, single electron detection, X-ray detection and visual imaging. In addition, new results are presented on photon feedback, breakdown and wire aging.

19335 (UCRL-JC–105226) **Quantitative radiography.** Logan, C.M.; Hernandez, J.M.; Devine, G.J. Lawrence Livermore National Lab., CA (United States). Feb 1991. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-910399–8: American Society for Nondestructive Testing spring conference, Oakland, CA (United States), 18-22 Mar 1991). Order Number DE92011523. Source: OSTI; NTIS; GPO Dep.

We have developed a system of quantitative radiography in order to produce quantitative images displaying homogeneity of parts. The materials that we characterize are synthetic composites and may contain important subtle density variations not discernable by examining a raw film x-radiograph. In order to quantitatively interpret film radiographs, it is necessary to digitize, interpret, and display the images. Our integrated system of quantitative radiography displays accurate, high-resolution pseudocolor images in units of density. We characterize approximately 10,000 parts per year in hundreds of different configurations and compositions with this system. Images are captured using DuPont NDT55 industrial x-ray film in Daypack™ packages. X-ray cabinets are of custom design, with helium flight path and a filter wheel for positioning filters if desired. The cabinets contain baffles to reduce scattered radiation and are equipped with drawer for rapid load/unload of parts. Separate units with tungsten-anode or copper-anode tubes are available. The usual operating voltage is 15 to 35 kVp. Fixturing provides for rough part positioning and precise alignment with respect to the x-ray source. Areal density standards are placed at several locations on each film. In interpreting the image, we use the standards nearest the image of the part being quantified. Because of this, small variations in x-ray flux uniformity (heel effects) are unimportant. The usual standard is a step wedge of aluminum containing 13 steps. Films are permanently labeled by imaging a perforated metal numbering strip. Data such as part number, step wedge identification, etc. are read from barcode labels and transferred to a data base for later retrieval and use in quantifying the image.

19336 (UCRL-JC-105234) **A method to track radiographic variables affecting image quality.** Weirup, D.L.; Devine, G.J.; Logan, C.M. Lawrence Livermore National Lab., CA (United States). Feb 1991. 4p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-910399-5: American Society for Nondestructive Testing spring conference, Oakland, CA (United States), 18-22 Mar 1991). Order Number DE92011464. Source: OSTI; NTIS; GPO Dep.

Separating x-ray source fluctuations from film processing variations is a difficult task. We have established a system which monitors the performance of our film and film processing. In order to monitor consistency we have developed two devices, the "spotburner" and the "flasher." The spotburner allows us to expose uniform small spots using a Cd-109 source over representative areas of a film. For each production film batch to be processed we use two spotburner films, one leading and one trailing the production films. To identify these films we use the flasher to mark the films with time and data. Production film batch information as well as important processor parameters are recorded in a data base for analysis and to keep a historical record. Quantitative radiography is very sensitive to film and processor variations. These variations may be brought about by many causes. One cause could be variation in the emulsion across the surface of a film. When exposing a film for quantitative analysis a stepwise of a known material is exposed along with the part to be evaluated. Any emulsion changes from the area of the stepwedge to the area of the test piece can make significant errors in perceived x-ray attenuation. A second cause of variations are fluctuations in the output of the x-ray source or changes in the flight path. A third source of film variations are processor fluctuations. Changes in developer chemistry, developer and time water temperatures, and film movement rates through the processor can all causes a shift in apparent exposure from one side of a film to the other.

19337 (UCRL-JC-110134) **Condenser optics, partial coherence, and imaging for soft x-ray projection lithography.** Sommargren, G.E.; Seppala, L.G. Lawrence Livermore National Lab., CA (United States). Mar 1992. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-9204120-1: Soft-x-ray projection lithography topical meeting, Monterey, CA (United States), 6-8 Apr 1992). Order Number DE92011762. Source: OSTI; NTIS; GPO Dep.

In this paper we have concentrated on the design and implications of condenser systems for an all reflective soft x-ray projection lithography system has five main components: the source, condenser (illumination system), mask, imaging system and wafer.

19338 (WSRC-MS-92-032) **Dry calorimetry at the Savannah River Site.** ReFalo, L.A. Westinghouse Savannah River Co., Aiken, SC (United States). [1992]. 54p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC09-89SR18035. Order Number DE92011051. Source: OSTI; NTIS; GPO Dep.

Heat flow calorimeters are used at the Savannah River Site to assay radioactive sources by measuring the emitted thermal power. The radioactive source is placed in a constant temperature environment and its thermal output is measured by non-destructive assay techniques. The isotopic mass is computed from the measured power through known watts/gram constants for each of the isotopes. The Equipment Engineering Section of the Savannah River Laboratory has developed calorimetric techniques which provide major improvements over other calorimeters. Improvements are in the areas of greater precision, reduced maintenance, and thermal control without using water. The elimination of water reduces criticality concerns during assay of fissionable materials and reduces health concerns during assay of tritium. Equipment Engineering Section has developed two basic dry calorimeter designs. The designs are identical in concept; however, they differ to accommodate different power levels. Each design has been tested demonstrating proof of concept. The current designs are for low wattage samples, .1 to 10 watts, and high wattage samples, 40 to 140 watts.

19339 (SAND-92-0344C) **New insights into radiation-induced oxide-trap charge through thermally-stimulated-current (TSC) measurement and analysis.** Fleetwood, D.M.; Miller, S.L.; Reber, R.A. Jr.; McWhorter, P.J.; Winokur, P.S. Sandia National Labs., Albuquerque, NM (United States). [1992]. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-76DP00789. (CONF-920716-4: Nuclear and space radiation effects conference, New Orleans, LA (United States), 13-17 Jul 1992). Order Number DE92009054. Source: OSTI; NTIS; GPO Dep.

In this summary, we re-evaluate estimates of trapped-hole energies inferred from TSC measurements and transistor annealing studies. Improved estimates of the trapped-hole "attempt-to-escape" frequency (υ_A) and a quantitative treatment of (Schottky) electric-field induced barrier lowering strongly suggest that previous estimates of trapped-hole energies in TSC and transistor annealing studies are too low. Moreover, we show that TSC measurements can be modeled analytically from first principles, and the resulting model can accurately predict TSC measurements under arbitrary heating conditions. Finally, we evaluate the dependence of electron trapping in irradiated SiO_2 on dose and on electric field during irradiation. 30 refs.

19340 (SAND-92-0357C) **Latent interface-trap buildup: issues for long-term device response.** Schwank, J.R.; Fleetwood, D.M.; Shaneyfelt, M.R.; Winokur, P.S. Sandia National Labs., Albuquerque, NM (United States). [1992]. 5p. Sponsored by Department of Defense, Washington, DC (United States). DOE Contract AC04-76DP00789. (CONF-920716-1: Nuclear and space radiation effects conference, New Orleans, LA (United States), 13-17 Jul 1992). Order Number DE92003148. Source: OSTI; NTIS; GPO Dep.

A large buildup in interface traps has been observed in commercial and radiation-hardened MOS transistors at very long times after irradiation (> 10^6 s). This latent buildup may have important implications for CMOS response in space. 13 refs.

19341 (SAND-92-0382C) **Qualifying commercial ICs for total-dose space environments.** Sexton, F.W. (Sandia National Labs., Albuquerque, NM (United States)); Fleetwood, D.M.; Pelletier, J.C.; Gaona, J.I. Jr.; Aldridge, C.C.; Garrett, G.; Fuller, E. Sandia National Labs., Albuquerque, NM (United States). [1992]. 4p. Sponsored by USDOE, Washington, DC (United States); Defense Nuclear Agency, Washington, DC (United States). DOE Contract AC04-76DP00789. (CONF-920716-3: Nuclear and space radiation effects conference, New Orleans, LA (United States), 13-17 Jul 1992). Order Number DE92009069. Source: OSTI; NTIS; GPO Dep.

Total-dose failure levels are measured for commercial FPGAs using MIL-STD 883D method 1019.4 and a modified test protocol with a room-temperature biased anneal following irradiation. These are compared with device response to low dose-rate irradiations. 10 refs.

19343 (DOE/ER/61072–4) **Cosine response characteristics of radiometric and photometric sensors.** Michalsky, J.J.; Harrison, L.C.; Berkheiser, W.E. III. State Univ. of New York, Albany, NY (United States). Atmospheric Sciences Research Center. [1992]. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG02-90ER61072. (CONF-920678–2: National solar energy conference, Cocoa Beach, FL (United States), 13-18 Jun 1992). Order Number DE92011437. Source: OSTI; NTIS; GPO Dep.

Global and diffuse irradiance and illuminance are measured with instruments that are assumed to have true cosine responses. It is known, largely from reports with a limited distribution or by word of mouth, that no instrument is perfect in this regard. This paper reports on measurements of cosine responses for several instrument types and manufacture familiar to the solar radiation measurement community. The measurements were made with an automated cosine response test bench using the same protocol for each instrument. The cosine bench measures with variable angular resolution as fine as 0.25 degrees. The automated rotation is in one plane. A manual rotation allows measurements for other azimuths. 6 refs.

19344 (DOE/ER/61229–1) **[Center of excellence: Microlaser microscope]: Annual progress report.** Webb, R.H. Eye Research Inst. of Retina Foundation, Boston, MA (United States). [1992]. 9p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG02-91ER61229. Order Number DE92013485. Source: OSTI; NTIS; GPO Dep.

This Center-of-Excellence grant has two components: development of an imaging system based on microlaser arrays forms a central project among a group of laser diagnostic and therapeutic efforts primarily funded outside the grant. In these first 8 months we have set up the Microlaser Microscope using small microlaser arrays. We have emphasized the basics of microlaser handling and electronic addressing and the optics of the microscope. Details of electronics and optics given here will be used in the larger arrays which should be available soon. After a description of the central Microlaser Microscope project, we touch briefly on the other projects of the Center, which have been outstandingly fruitful this year. Publications are necessarily concerned with the smaller projects, since the Microlaser Microscope is in its early stages.

19345 (ENEA-RT-NUCL–90-38) **Grating low-pass filters.** Tudisco, O. ENEA, Frascati (Italy). Area Nucleare. Apr 1991. 18p. (RT/NUCL–90-38). Order Number DE92506288. Source: OSTI; NTIS (US Sales Only); INIS.

Gratings are excellent low-pass filters, provided they have the appropriate mounting. The spectral reflectivity of filters composed of four gratings has been measured, from the 0.2 mm to 2 mm wavelength region. In order to contain the size of the gratings, they were placed near a lens focus, where the beam section is smaller. The effect of nonparallel light is to smooth the cut-off edge of the filters. The measurements are in good agreement with the diffraction theory of gratings.

19346 (SAND–91-2459) **Portable surveillance unit instruction manual.** Martinez, R.L. Sandia National Labs., Albuquerque, NM (United States). Mar 1992. 17p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-76DP00789. Order Number DE92011514. Source: OSTI; NTIS (US Sales Only); GPO Dep.

The Portable Surveillance Unit (PSU) is a small, self-contained unit that can easily be transported for quick setup in any surveillance application. The system is ideally suited for short-term, temporary, unattended video surveillance and recording applications, though it can operate continuously for three months, assuming a 5-minute interval to replace the video tape. Depending on the programmed interval, the PSU is capable of 24-hour internal battery operations, and longer periods when powered from ac main power. This document is a descriptive and instructional manual for the operation of the Portable Surveillance Unit.

19347 (SAND–91-2579) **Initial laboratory evaluation of color video cameras.** Terry, P.L. Sandia National Labs., Albuquerque, NM (United States). Mar 1992. 30p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-76DP00789. Order Number DE92010399. Source: OSTI; NTIS; GPO Dep.

Sandia National Laboratories has considerable experience with monochrome video cameras used in alarm assessment video systems. Most of these systems, used for perimeter protection, were designed to classify rather than identify an intruder. Monochrome cameras are adequate for that application and were selected over color cameras because of their greater sensitivity and resolution. The increased emphasis placed on the identification objective of video security systems leads to the need to improve system designs and upgrade existing systems. Color information is useful for identification purposes, and color camera technology is rapidly changing. Thus, Sandia National Laboratories established an ongoing program to evaluate color solid-state cameras. This report describes test parameters and procedures and provides the results of an initial evaluation.

19348 (UCRL-CR–103698) **Dispersive-infrared gas sensor system design and operation manual.** Kulp, T.J.; McRae, T.G.; Kennedy, R.; Garvis, D. Lawrence Livermore National Lab., CA (United States). Oct 1991. 127p. Sponsored by Department of Defense, Washington, DC (United States). DOE Contract W-7405-ENG-48. Order Number DE92011766. Source: OSTI; NTIS; GPO Dep.

The objective of this project was to develop nondispersive infrared (IR) gas sensor capable of detecting and quantifying gaseous HCl emitted during the launch of rockets using solid propellants. To satisfy the practical requirements of this application, the sensor must be capable of unmanned field operation, remotely addressable, field calibratable, and able to measure low concentrations (1 ppm) of HCl at relatively rapid rates.

19349 (UCRL-JC–109219) **Resolution limits for ground based astronomical imaging using adaptive optics.** Olivier, S.S.; Max, C.E.; Gavel, D.T.; Brase, J.M. Lawrence Livermore National Lab., CA (United States). 10 Mar 1992. 6p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-9203139–1: Laser guide star adaptive optics workshop, Albuquerque, NM (United States), 10-12 Mar 1992). Order Number DE92011949. Source: OSTI; NTIS; GPO Dep.

We study the residual jitter present in astronomical images after the effect of the earth's atmosphere has been compensated using a fast steering mirror. This residual jitter places a limit on the resolution that can be achieved for long exposure images even when more elaborate adaptive optics systems are used to correct the image. We assume that the fast guiding system uses a star as it reference source. Then, from the observed characteristics of Galactic stellar populations, we are able to predict the optimal performance of the fast guiding system as a function of the sky covering factor, that is the fraction of the sky for which the given level of performance can be achieved. The performance for a particular sky covering factor is optimized by choosing the appropriate closed-loop bandwidth and guide star magnitude. The performance also depends on a number of atmospheric and system parameters; however, we find that the optimal performance is relatively insensitive to all but two of these parameters, the telescope aperture size and the strength of the atmospheric turbulence. Therefore, we consider two specific examples: first, a ten meter telescope imaging an atmosphere with relatively weak turbulence (3/4 arcsecond seeing in V), and second, a one meter telescope imaging through an atmosphere with relatively strong turbulence (2 arcsecond seeing in V). For these cases we find, for example, that a residual jitter of less than 0.03 and 0.3 arcseconds respectively can be obtained over about half the sky for nominal choices of the other parameters. The required closed-loop bandwidths in these cases are about 5 and 20 Hz while the appropriate guide stars are approximately 18th and 14th magnitude in V. 6 refs.

19350 (ANL/CP–75957) **On-line emissions monitoring of chlorobenzene incineration using Fourier transform infrared spectroscopy.** Mao, Zhuoxiong; McIntosh, M.J.; Demirgian, J.C. Argonne National Lab., IL (United States). [1992]. 24p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38. (CONF-920527–1: Incineration conference, Albuquerque, NM (United States), 11-14 May 1992). Order Number DE92013041. Source: OSTI; NTIS; GPO Dep.

Incineration of chlorobenzene in a small laboratory incinerator was monitored by using Fourier transform infrared spectroscopy (FTIR) coupled with a heated long-path cell (LPC) to analyze and quantify flue gas emissions in near real time. The effects of operating conditions under stable and decreasing incineration temperatures on the destruction of chlorobenzene were studied. The results from the decreasing temperature experiments were found to be consistent with those from experiments at stable temperatures. This finding demonstrates that the FTIR/LPC, as a continuous emissions monitor, can effectively detect dynamic changes in the incinerator emissions and can contribute significantly to the safety of incinerators.

19351 (ETDE-IT–92-27) **Telemetry in Italy (Abitare Domani marketing survey).** Mastrolilli, M.; Zullo, F. Agip-Petroli, Rome (Italy). 1991. 35p. (In Italian). (CONF-9111217–2: L'Europa dei teleservizi tecnici: le esperienze dei gestori e le prospettive di sviluppo, Rome (Italy), 21-22 Nov 1991). Order Number DE92506243. Source: OSTI; NTIS (US Sales Only).

A survey was conducted by an Italian organization called Abitare Domani (translation: living tomorrow) to determine the diffusion of the use of telemetric equipment in Italy. The Organization developed a questionnaire to monitor the use of telemetric equipment in a variety of industrial, commercial, residential and public service applications, e.g., industrial plant on-line control for plant operation, performance monitoring, maintenance and safety; telecommunications; building energy management; security; etc. This paper reports some of the first results.

19352 (ETDE-IT–92-28) **Tele-management communications systems marketing in France.** Le Gal, Yann. 1991. 12p. (In French). (CONF-9111217–3: L'Europa dei teleservizi tecnici: le esperienze dei gestori e le prospettive di sviluppo, Rome (Italy), 21-22 Nov 1991). Order Number DE92506244. Source: OSTI; NTIS (US Sales Only).

This paper surveys the types of telemetric equipment available on the market in France. Brief notes are provided on the performance capabilities of telemetric equipment used in a variety of industrial, commercial, residential and public service applications, e.g., industrial plant on-line control for plant operation, performance monitoring, maintenance and safety; telecommunications; building energy management; security; etc.

19353 (LA-UR–92-789) **Readily implemented enhanced sinusoid detection in noise.** Lindsay, K.V. Los Alamos National Lab., NM (United States). 5 Mar 1992. 45p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. Order Number DE92011359. Source: OSTI; NTIS; GPO Dep.

Significant efforts have been devoted, spanning many years, to the problem of sinusoid detection in noise. Many of these efforts have produced superb, yet complex, algorithms which may be difficult to use for a wide segment of the Digital Signal Processing (DSP) community. This paper presents a simple, easily implemented and high effective method which solves this problem. This method severely degrades non-sinusoidal noise while leaving the embedded sinusoid(s) relatively undisturbed. The algorithm, simply put, exploits the difference between the net effect of integration and differentiation of sinusoids versus the effect of these operations on random noise and other signal sequences. The cross-correlation of sine wave with its differentiated (and/or integrated) self is quite high. Conversely, the cross-reduction of a noise sequence with its differentiated (and/or integrated) self is much lower. Therefore, it is reasonable to assume that for sequences consisting of a sinusoid in noise, significant signal-to-noise-ratios (SNRs) in the correlation results are achievable using a combination of differentiation (and/or integration) and cross-correlation operations on such sequences. This technique has been applied to actual Doppler radar data, as well as to synthesized data, with excellent improvement in signal detection capability. 4 refs.

19354 (RFP–4529) **Improvements to the Rocky Flats Metrology Laboratories Velocity Meter Calibration System.** Abercrombie, K.R. EG and G Rocky Flats, Inc., Golden, CO (United States). Rocky Flats Plant. 12 Mar 1992. 16p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC34-90DP62349. Order Number DE92013162. Source: OSTI; NTIS; GPO Dep.

The Rocky Flats Standards Laboratory has undertaken a project to improve calibration of air velocity meters by reducing the uncertainty of the Velocity Meter Calibration System. The project was accomplished by analyzing the governing equation in order to determine which areas within the system contributed most to the overall system uncertainty. Then, based upon this new analysis, new components were selected to replace the components identified in the analysis. Finally, the system was re-evaluated to determine the new systematic uncertainty for the system.

19355 (SAND–92-0410) **Primary Standards Laboratory Report: Second half 1991.** Sandia National Labs., Albuquerque, NM (United States). Mar 1992. 30p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-76DP00789. Order Number DE92013290. Source: OSTI; NTIS; GPO Dep.

Sandia National Laboratories operates the Primary Standards Laboratory (PSL) for the Department of Energy, Albuquerque Operations Office (DOE/AL). This report summarizes metrology activities that received emphasis in the second half of 1991 and provides information pertinent to the operation of the DOE/AL system-wide Standards and Calibration Program.

19356 (SAND–92-0518C) **Random vibrations measurements with isolated accelerometers.** Paez, T.L. (Sandia National Labs., Albuquerque, NM (United States)); Gibson, B.W. Sandia National Labs., Albuquerque, NM (United States). [1992]. 11p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-76DP00789. (CONF-9205127–2: Institute of Environmental Sciences symposium, Nashville, TN (United States), May 1992). Order Number DE92011186. Source: OSTI; NTIS; GPO Dep.

Isolated accelerometer measurement systems are used to measure environments composed of a wide spectrum of frequencies including the natural frequency of the isolated accelerometer. Because the isolated accelerometer measurement system is a nonlinear system, it is subject to the potential for chaotic vibrations. it is clear that this potential if realized, affects the response of the measurement system to vibration input and perhaps to shock input also. This paper explores the effects that the potential for chaotic vibrations and nonlinear response, in general, has on the random vibration response of the isolated accelerometer measurement system. Specifically, the system response to white noise is investigated and assessed in terms of response histogram and response spectral density. 6 refs.

19357 (UCRL-MA–107572) **User's guide supplement for NEC-GS.** Burke, G.J. Lawrence Livermore National Lab., CA (United States). May 1991. 11p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. Order Number DE92011445. Source: OSTI; NTIS; GPO Dep.

NEC-GS is a reduced version of NEC-3 optimized for modeling a vertical monopole on a uniform radial-wire ground screen. With NEC-GS, large radial wire ground screens can be modeled with the radial wires included in the moment-method solution and the effect of ground included through an accurate evaluation of the Sommerfeld integrals. NEC-GS can be used to model any wire structure with azimuthal symmetry, as long as the excitation also has azimuthal symmetry. The moment-method solution involves no basic approximations, such as assumed currents or field values, as are often used in modeling radial wire ground screens. There are, however, limitations in the solution method that can result in inaccurate results under some conditions. Accuracy questions are discussed to some extent in Section 3. NEC-GS should be used with caution until more validation has been done and the accuracy is better understood.

19358 (CONF-920458–6) **Cathodic protection activities in the inactive fleet.** Lloyd, D.B. Oak Ridge National Lab., TN (United States). [1992]. 8p. Sponsored by Department of Defense, Washington, DC (United States). DOE Contract AC05-84OR21400. From Corrosion '92 conference and exhibition; Nashville, TN (United States); 27 Apr - 1 may 1992. Order Number DE92011679. Source: OSTI; NTIS; GPO Dep.

Responsibility for US Navy ships that are designated "inactive" resides with the Inactive Fleet Division of the Naval Sea Systems Command. Many of the ships that are removed from active service are retained in case of future need. Inactivation and preservation procedures must be thorough and long lasting, for the inactive status period may be as much as 20 years or more. One of the principle techniques used is that of cathodic protection, in which electric potentials are used to retard corrosion. In 1987 the Oak Ridge National Laboratory (ORNL) was engaged by the US Navy Inactive Fleet to review the manner in which cathodic protection (CP), was being implemented at the various Naval Inactive Fleet Maintenance Facilities (NISMFs).

19359 (CONF-920747–1-Extd.Abst.) **Electrostatic ion thruster optics calculations.** Whealton, J.H (Oak Ridge National Lab., TN (United States)); Raridon, R.J.; Kirkman, D.A. Oak Ridge National Lab., TN (United States). [1992]. 6p. Sponsored by National Aeronautics and Space Administration, Washington, DC (United States). DOE Contract AC05-84OR21400. From 28. joint propulsion conference; Nashville, TN (United States); 6-8 Jul 1992. Order Number DE92006608. Source: OSTI; NTIS; INIS; GPO Dep.

Two- and three-dimensional ion thruster optical calculations including both source and exhaust plasmas are performed. These calculations include both a self-consistent ion source extraction plasma sheath and an explicit computation of the primary ion optics including sheath and electrode induced aberrations. A study determining the effects of beam space charge, accelerator geometry, and properties of the downstream plasma sheath on the position of the electrostatic potential saddle point near the extractor electrode is made. Results of the electron blocking potential barrier height as a function of electrode thickness and secondary plasma processes are described.

19360 (EGG-PHY–10134) **Imaging system (INEL): FY-91 Summary report.** Partin, J.K.; Lassahn, G.D.; Davidson, J.R. EG and G Idaho, Inc., Idaho Falls, ID (United States). Oct 1991. 16p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC07-76ID01570. Order Number DE92012366. Source: OSTI; NTIS; GPO Dep.

This progress report gives a brief description of the general automatic target recognition system algorithms developed for this project, and also summarizes the progress in fiscal 1991. An appendix discusses the proposed computer hardware for this system.

19361 (LA-UR–92-104) **Artificial Intelligence for Explosive Ordnance Disposal System (AI-EOD).** Madrid, R.; Williams, B.; Holland, J. Los Alamos National Lab., NM (United States). [1992]. 10p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-920758–1: Innovative applications of artificial intelligence; International joint conference on neural networks, San Jose, CA (United States); Baltimore, MD (United States), 13-15 Jul 1992; 7-11 jun 1992; CONF-9206102–1). Order Number DE92007587. Source: OSTI; NTIS; GPO Dep.

Based on a dynamically configurable neural net that learns in a single pass of the training data, this paper describes a system used by the military in the identification of explosive ordnance. Allowing the technician to input incomplete, contradictory, and wrong information, this system combines expert systems and neural nets to provide a state-of-the-art search, retrieval, and image and text management system.

19362 (SAND–91-2343) **1991 rocket-triggered lightning test of the DOD Security Operations Test Site (SOTS) munitions storage bunker, Ft. McClellan, Alabama: Volume 1.** Schnetzer, G.H.; Fisher, R.J. Sandia National Labs., Albuquerque, NM (United States). Feb 1992. 135p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-76DP00789. Order Number DE92012449. Source: OSTI; NTIS; GPO Dep.

During June and July 1991, the Sandia Transportable Lightning Instrumentation Facility (SATTLIF) was fielded at the Department of Defense (DoD) Security Operations Test Site (SOTS) at Ft. McClellan, Alabama. Nine negative cloud-to-ground lightning flashes were artifically triggered to designated locations on Igloo 2, a weapons storage bunker specially prepared to allow instrumentation access to various of its structural and electrical system elements. Simultaneous measurements of the incident flash currents and responses at 24 test points within the igloo and its grounding counterpoise network were recorded under lightning attachments to the front and rear air terminals of the structure's lightning protection system. In Volume I the test is described in detail. The measured data are summarized and discussed. Appendix A contains the full set of recorded incident flash currents, while Appendix B presents the set of largest responses measured at each test point, for both front and rear attachments to the structure. As part of these tests, 0.050-in-thick stainless steel, 0.08-in copper, and 0.08-in titanium samples were exposed to triggered flash currents. In this way, damage spots created by direct-strike triggered lightning have been obtained, along with the measurement of the return-stroke and continuing currents that produced them. These data points, along with similar ones on aluminum and ferrous steel obtained during 1990 will be used as benchmarks against which to quantify the fidelity of burnthrough testing achievable Sandia's advanced laboratory lightning simulator.

19363 (SAND–91-2495-Vol.1) **NAASW modular radar research testbed study results: Volume 1.** Sandia National Labs., Albuquerque, NM (United States). Dec 1991. 294p. Sponsored by Department of Defense, Washington, DC (United States). DOE Contract AC04-76DP00789. Order Number DE92011339. Source: OSTI; NTIS (US Sales Only); GPO Dep.

Sandia National Laboratories has defined conceptual design approaches, development costs and development schedules for a synthetic-aperture radar testbed system for imaging of the ocean. The proposed system, referred to herein as the Modular Radar Research Testbed (MRRT), is capable of simultaneous operation at multiple frequencies. The design features a nearly autonomous radar operating at each frequency. The architecture minimizes the number of frequency-dependent modules in the system and supports a variety of real-time imaging modes, including side-looking strip map, squinted strip map, coherent spotlight, long-dwell squint (multiple images of the same scene from different squint angles), interferometry, and polarimetry. This volume: (1) Identifies salient system features and modules; describes system modes; provides systems specifications and block diagrams. (2) Presents requirements for the study. (3) Describes the various aspects of the system's architecture (generic data link, Digital Signal Processor, Image Processing Assembly, etc). (4) Provides descriptions of system modes of operation (strip map, squinted strip map, interferometry, etc.). and (5) Contains descriptions of analyses relating to interferometry and Displaced-Phase-Center Antenna.

19364 (SAND–91-2495-Vol.2) **NAASW modular radar research testbed study results: Volume 2.** Sandia National Labs., Albuquerque, NM (United States). Dec 1991. 299p. Sponsored by Department of Defense, Washington, DC (United States). DOE Contract AC04-76DP00789. Order Number DE92011340. Source: OSTI; NTIS (US Sales Only); GPO Dep.

Sandia National Laboratories has defined conceptual design approaches, development costs and development schedules for a synthetic-aperture radar testbed system for imaging of the ocean. The proposed system, referred to herein as the Modular Radar Research Testbed (MRRT), is capable of simultaneous operation at multiple frequencies. The design features a nearly autonomous radar operating at each frequency. The architecture minimizes the number of frequency-dependent modules in the system and supports a variety of real-time imaging modes, including side-looking strip map, squinted strip map, coherent spotlight, long-dwell squint (multiple images of the same scene from different squint angles), interferometry, and polarimetry. This volume (1) analyzes calibration requirements for the multi-channel SAR architecture; (2) presents studies of microwave portions of the system (intermodulation products, phase noise, etc.); (3) describes the high-accuracy navigation techniques and our method for applying motion compensation data; (4) reports results of various MRRT analyses (image-formation techniques, multi-look algorithms, squint mode, etc.); and (5) contains vugraphs from the SNL MRRT technical review held in February 1991.

19365 (SAND–91-2664) **B-52G/H nuclear certification tasks performed by the Aircraft Compatibility Division at Sandia National Laboratories.** Stevenson, L.E.; Wifall, J.R. Sandia National Labs., Albuquerque, NM (United States). Feb 1992. 41p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-76DP00789. Order Number DE92013681. Source: OSTI; NTIS (US Sales Only); GPO Dep.

This report documents aircraft compatibility evaluations performed on the current versions of the B-52G/H aircraft and how those efforts led to the recommendation that the aircraft be added to the Aircraft Compatibility Control Drawing (ACCD) of an associated bomb or warhead system. The B-52 Aircraft Compatibility personnel, Division 5147, shall initially assemble this document and then update it on a yearly basis as defined in Reference 1.

19366 (SAND–92-0024) **Quasistatic modeling and testing of exclusion region barrier mock-ups.** Wellman, G.W.; Salzbrenner, R. Sandia National Labs., Albuquerque, NM (United States). Mar 1992. 40p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-76DP00789. Order Number DE92012686. Source: OSTI; NTIS; GPO Dep.

The first phase of a program to study the resistance of exclusion region barriers to ductile failure when subjected to accident-type, quasi-static extreme mechanical loads has been completed. This first phase consisted to qualification of the analytical tools used to study these types of structural deformations and the development of appropriate criteria to predict ductile failure. A series of tests were performed on hydroformed half-cylinder barrier mock-ups. The qualification activity was considered a success based upon the comparison of the deformations and loads measured during the testing to the response of these structures computed by the finite element modeling. This successful completion of the first phase allows the second phase program to proceed. 12 refs.

19367 (SAND–92-0404C) **Three-dimensional shock wave physics simulations on massively parallel supercomputers.** Gardner, D.R.; Fang, H.E. Sandia National Labs., Albuquerque, NM (United States). [1992]. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-76DP00789. (CONF-920771–1: 1992 summer computer simulation conference, Reno, NV (United States), 27-30 Jul 1992). Order Number DE92008679. Source: OSTI; NTIS (US Sales Only); GPO Dep.

Three applications of massively parallel computing to weapons development at Sandia National Laboratories are briefly described, including armor/antiarmor simulations. The numerical modeling of penetrator-armor interactions requires detailed, three-dimensional simulation of complex interactions of exotic materials at high speeds. Massively parallel version of CTH and MESA, Eulerian hydrocodes developed in part for armor/antiarmor simulations, are being developed for popular architectures. The codes include models for elastic-plastic material deformation, fracture, and high explosives. Typical armor/antiarmor penetration simulations conducted on massively parallel computers with these codes are presented. The associated speedups as the simulation size is increased indicate that high parallel efficiencies can be achieved for realistic problems. These simulations demonstrate that massively parallel hydrocodes can provide highly-detailed, three-dimensional simulations of armor/antiarmor systems.

19369 (UCRL-JC–109718) **Assessing the impact of reduced airspeed on tiltrotor support to ground combat.** Warshawsky, A.S.; Olness, D.U.; Uzelac, M.J. Lawrence Livermore National Lab., CA (United States). 14 Feb 1991. 6p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-9206153–1: 48. annual forum and technology display of the American Helicopter Society (AHS), Washington, DC (United States), 3-5 Jun 1992). Order Number DE92011329. Source: OSTI; NTIS; GPO Dep.

This paper reports the sensitivity of assessments of tiltrotor effectiveness for supporting ground combat to reductions in airspeed of V-22s carrying external sling loads. Attrition to ground-based air defenses realized in the simulations is presented. Finally, results of the supported ground combat are presented. 2 refs.

19370 (UCRL-JC–109817) **Automated operations planning: Modeling MLRS operations.** Cunningham, C.T. Lawrence Livermore National Lab., CA (United States). 5 Mar 1992. 6p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-920771–3: 1992 summer computer simulation conference, Reno, NV (United States), 27-30 Jul 1992). Order Number DE92011917. Source: OSTI; NTIS; GPO Dep.

The multiples launch rocket system (MLRS) is a highly survivable and automated complement to conventional cannon artillery. For best survivability against counter-battery fire, MLRS operations rely on rapid "shoot-and-scoot" tactics by widely dispersed launchers. Such tactics may be difficult to include in a battlefield simulation without requiring players for the individual MLRS items: launchers and resupply vehicles. To reduce this demand on player resources, a computer model has been developed to automate the behavior of the items, consistent with the published operations doctrine. A player is required to determine the area of operation and certain key locations for an MLRS firing platoon. Analysis of trafficability in the operations area and direction the movement of the items, as the perform fire missions, resupply, and replenishment of platoon stocks, is completely automated. A finite state machine representation of the items is used. The model is currently implemented on a VAX 6310. It will be integrated with the Janus battlefield trainer.

19371 (UCRL-JC–109840) **Polygon framing in UCCATS.** Grum, H.G.; Samuelson, N.H. Lawrence Livermore National Lab., CA (United States). 24 Feb 1992. 5p. Sponsored by Department of Defense, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-920771–2: 1992 summer computer simulation conference, Reno, NV (United States), 27-30 Jul 1992). Order Number DE92011971. Source: OSTI; NTIS (US Sales Only); GPO Dep.

UCCATS is a high resolution urban combat simulation designed to support analysis, training and operational planning applications for the armed forces. Urban modeling requires higher resolution terrain than models such as Janus. Polygons of arbitrary size provide the necessary detail. The number of polygons easily becomes large enough to violate run-time speed requirements. Polygon framing provides an effective filter to eliminate polygons from expensive movement and line of sight calculations.

4501 Chemical Explosions and Explosives

19372 (SAND–90-1326) **The collection, handling, transportation, and thermal desorption of explosive vapor using quartz collection tubes.** Rodacy, P.J.; Ingersoll, D. Sandia National Labs., Albuquerque, NM (United States). Apr 1992. 26p. Sponsored by USDOE, Washington, DC (United States); Department of the Treasury, Washington, DC (United States); Department of Justice, Washington, DC (United States). DOE Contract AC04-76DP00789. Order Number DE92011441. Source: OSTI; NTIS; GPO Dep.

This work describes the collection, handling, transportation, thermal desorption, and analysis of explosive vapors using quartz collection tubes. A description of the sampling system is presented, along with the collection efficiency of the quartz tubes and some of the precautions necessary to maintain the sample integrity. The design and performance characteristics of the thermal desorption system are also discussed. Collection of explosive vapor using empty, 0.25 inch O.D. by 5.25 inch long quartz tubes at a flow rate of 200 mL min-1 is quite different. Thermal desorption of the explosive vapor molecules using a furnace that allows control of the gas phase chemistry in the IMS has been shown to provide a reliable, reproducible means of analysis. Empty quartz tubes provide a sharper desorption profile than packed collection tubes, resulting in a better signal-to-noise ratio, and perhaps, a lower detection limit than packed quartz tubes. Both the ion drift time of the explosive and its desorption characteristics can provide a means of identification. Sample handling, packaging, and transportation methods which minimize sample loss and contamination have been developed and evaluated.

19373 (UCRL-CR-110256) **Computed tomography experiments of Pantex high explosives.** Perkins, D.E. (Lawrence Livermore National Lab., CA (United States)); Martz, H.E.; Hester, L.O.; Sobczak, G.; Pratt, C.L. Lawrence Livermore National Lab., CA (United States); Mason and Hanger-Silas Mason Co., Inc., Amarillo, TX (United States). Apr 1992. 45p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. Order Number DE92013517. Source: OSTI; NTIS; GPO Dep.

X-ray computed tomography is an advanced imaging technique which provide three-dimensional nondestructive characterization of materials, components and assemblies. The CT Project group at Lawrence Livermore National Laboratory (LLNL) and the Pantex Plant are cooperating to examine the use of CT technology to inspect and characterize high-explosives pressings (e.g. PBX-9502, LX-10-2). High-explosives pressings manufactured by Pantex must be characterized prior to assembling into weapons systems; a nondestructive examination of all assembly parts would be preferable to the current sampling and destructive testing. The earlier in the processing cycle this can be done the more cost effective it will be. We have performed experiments that show that this characterization can be performed at the pressed billet stage using CT. We have detected 2-mm inclusions in a 15-cm diameter billet and 3.5-mm voids in a 20-cm diameter billet. Based on these results we show calculations that can be used to design production CT systems for characterization of high-explosives. 11 refs.

19374 (UCRL-JC-108985) **Turbulent dusty boundary layer in an ANFO surface-burst explosion.** Kuhl, A.L.; Ferguson, R.E.; Chien, K.Y.; Collins, J.P. Lawrence Livermore National Lab., CA (United States). Jan 1992. 39p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-920707-28: 24. international symposium on combustion, Sydney (Australia), 5-10 Jul 1992). Order Number DE92012101. Source: OSTI; NTIS; GPO Dep.

This paper describes the results of numerical simulations of the dusty, turbulent boundary layer created by a surface burst explosion. The blast wave was generated by the detonation of a 600-T hemisphere of ANFO, similar to those used in large-scale field tests. The surface was assumed to be ideally noncratering but contained in initial loose layer of dust. The dust-air mixture in this fluidized bed was modeled as a dense gas (i.e., an equilibrium model, valid for very small-diameter dust particles). The evolution of the flow was calculated by a high-order Godunov code that solves the nonsteady conservation laws. Shock interactions with dense layer generated vorticity near the wall – similar to viscous, no-slip effects found in clean flows. The resulting will shear layer was unstable, and rolled up into large-scale rotational structures. These structures entrained dense material from the wall layer and created a chaotically striated flow. The boundary layer grew due to merging of the large-scale structures and due to local entrainment of the dense material from the fluidized bed. The chaotic flow was averaged along similarity lines (i.e., lines of constant values of $x = r/Rs$ and $y = z/Rs$ where $R_s = ct^{\alpha}$) to establish the mean-flow profiles and the r.m.s. fluctuating-flow profiles of the boundary layer.

19375 (UCRL-JC-108986) **Evolution of reactants fluid volume in turbulent jets.** Kuhl, A.L. (Lawrence Livermore National Lab., CA (United States)); Bell, J.; Ferguson, R.E.; Chien, K.Y.; Collins, J.P. Lawrence Livermore National Lab., CA (United States). Jan 1992. 14p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-920707-27: 24. international symposium on combustion, Sydney (Australia), 5-10 Jul 1992). Order Number DE92011298. Source: OSTI; NTIS; GPO Dep.

Numerical simulations of the evolution of an axisymmetric gaseous fuel jet penetration into a liquid oxidizer were performed with a multifluid version of a high-order Godunov code. The fuel jet was unstable and rapidly broke up into mixing structures with a variety of length scales. The complexity of the mixing increased with increased grid resolution. However, grid refinement studies demonstrated that the reactants volume (i.e., the fuel volume within specified concentration limits) rapidly converged to a solution that was insensitive to the mesh size.

4502 Nuclear Explosions and Explosives

19376 (DOE/NV-296-Rev.1) **A perspective on atmospheric nuclear tests in Nevada fact book: Revision 1.** Friesen, H.N. Raytheon Services Nevada, Las Vegas, NV (United States). Apr 1992. 43p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC08-91NV10833. Order Number DE92012298. Source: OSTI; NTIS; INIS; GPO Dep.

This Fact Book provides historical background and perspective on the nuclear testing program at the Nevada Test Site (NTS). Nuclear tests contributing to the off-site deposition of radioactive fallout are identified, and the concept of cumulative estimated exposure is explained. The difficulty of associating health effects with radiation is presented also. The status of litigation against the government and legislation (as of December 1991) are summarized.

19377 (MLM-3731) **Testing the B-90 cap release using strobe photography.** Cornwell, D.P.; Robbins, V.E.; McCoy, G.W. Mound, Miamisburg, OH (United States). 9 Apr 1992. 15p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-88DP43495. Order Number DE92012413. Source: OSTI; NTIS; GPO Dep.

This report presents the data collected during the testing of different cap designs for the XMC4231 cap release. The testing was performed to document the feasibility of the proposed WR (War Reserve) test method in the event that this program is revived in the future. Before the program's cancellation, several cap designs were constructed and subjected to simulated hail in the laboratory to determine hail impact resistance. The hail-tested units, identical control units, and practice units were tested in a method similar to that proposed as the WR production acceptance test for the cap release function. This report discusses problems encountered and ideas developed during the tests and presents a short discussion of the cap designs.

19378 (SAND-91-2329) **Development report for Group II SA3642 Surge Protector Assembly.** Grieco, S.E. Sandia National Labs., Albuquerque, NM (United States). Mar 1992. 61p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-76DP00789. Order Number DE92013456. Source: OSTI; NTIS (US Sales Only); GPO Dep.

The SA3642 is the Surge Protector Assembly portion of the MC4078 Lightning Arrestor Connector Surge Protector used in the W89 missile-warhead interface. The SA3642 is a connector assembly that holds filters for attenuation of high-frequency noise and diodes for transient suppression on each contact. The development plan for the MC4078 calls for three development groups of material to be fabricated and evaluated prior to Process Prove-In and Pilot Production. This report documents the device performance measured, experience gained, and the plans generated by the second development group.

19379 (UCRL-CR-109639) **Fickian filtering of cavity gases rising through a fractured permeable overburden.** Nilson, R.H. (S-Cubed, La Jolla, CA (United States)); Lie, K.; Peterson, E.W. Lawrence Livermore National Lab., CA (United States); S-Cubed, La Jolla, CA (United States). [1987]. 24p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (SSS-R-88-8687;CONF-870961-12: 4. symposium on containment of underground nuclear explosions, Colorado Springs, CO (United States), 21-24 Sep 1987). Order Number DE92010439. Source: OSTI; NTIS; INIS; GPO Dep.

In naturally or explosively fractured geologic media most of the responsibility is associated with the fracture network, whereas most of the porosity resides within the matrix blocks. Thus, both levels of porosity, fracture and matrix, are important in controlling the transient migration of radioactive gases from an underground nuclear cavity to the earth's surface. A numerical model of a double-porosity medium is used to investigate the upward transport of contaminant resulting from a moderate post-collapse overpressure in the chimney and/or critical pumping due to atmospheric pressure variations. It is found that the threat of rapid arrival through fractures is greatly mitigated by the process of Fickian diffusion which "filters" the contaminated gases as they rise through the fractures. Because of differences in concentration, contaminant species are drawn out of the rising gases into the surrounding porous matrix which contains relatively fresh air. The effectiveness of this Fickian filtering process depends on the aperture and spacings of fractures. Thus, consideration is given to the question of estimating these parameters of a double-porosity medium using field measurements such as barometric pressure data.

19380 (UCRL-JC-105269) **Godunov methods on a staggered mesh: An improved artificial viscosity.** Christensen, R.B. Lawrence Livermore National Lab., CA (United States). 2 Nov 1990. 11p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-9011149-20: 1990 nuclear explosives code developers' conference, Monterey, CA (United States), 6-9 Nov 1990). Order Number DE92011973. Source: OSTI; NTIS (US Sales Only); GPO Dep.

We present a method for obtaining a High-Order, Non-Oscillatory hydro scheme for staggered mesh, internal energy-based codes using a simple modification of the standard von-Neumann artificial viscosity method. This modification is derived by applying the Godunov technique directly to a staggered mesh and replacing the full Riemann solution by a particular approximate Riemann solver. It will be shown to deliver results much better than the standard scheme and comparable to other modern hydro methods.

4504 Nuclear and Radiological Warfare

19381 (LA-12293-MS) **Errata to crisis stability indices for adaptive two-layer defenses.** Canavan, G.H. Los Alamos National Lab., NM (United States). May 1992. 17p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. Order Number DE92012400. Source: OSTI; NTIS; GPO Dep.

An earlier treatment overestimated the survivability of an attacker's non-alert aircraft and hence their contribution to his first strike. This report corrects the error and discusses its impact, which is primarily important for ground-based defenses. It reduces the attacker's aircraft survival rates to about those of the defender's, improving the stability properties of space-based defenses.

4505 Strategic Defense Initiative

19382 (LA-12197-MS) **Burros: Simple, affordable, effective space transportation.** Canavan, G.H. Los Alamos National Lab., NM (United States). May 1992. 23p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. Order Number DE92013553. Source: OSTI; NTIS; GPO Dep.

This note argues that space is the best place to put not only the sensors, but also the SBIs Spare Based Interceptors and DEWs Directed-Energy Weapons needed to address long-range, intra- and inter-theater missiles efficiently. There are real threats; they are likely to worsen. Ground-based defenses cannot handle them all affordably. Mixes are generally appropriate. There is a role for SBIs, but it doesn't appear to require all of the capabilities built into the current SBIs at the outset. The SBIs that are needed now could be no more than cheap burros that were amenable to joint development and robust command for the protection of all. Their deployment for (GPALs) Global Protection Against Limited Strikes should not adversely impact the arms control or crisis stability of the strategic balance with the Soviet Union in any rational, concrete calculus, including that used by the Soviet Union. Deployment at low latitudes should give them adequate capability against theater launches but none against Soviet (ICMBs) International Ballist Missiles and only marginal, residual impact on (SLBMs) Submarine-Launched Ballistics Missiles. They should not either leave hot production capability of anything threatening or provoke untoward responses. We have a hot production line on Chevrolets that would pose more of a threat to the Soviet Union. Their inability to overcome even crude Soviet countermeasures would be an asset in this light. A companion effort could develop the brilliant eyes needed to guide them. A similar logic is possible with DEWs, but they are less developed and hence less at issue. 57 refs.

19383 (LA-12294-MS) **Stability of large offensive force reductions.** Canavan, G.H. Los Alamos National Lab., NM (United States). May 1992. 17p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. Order Number DE92013554. Source: OSTI; NTIS; GPO Dep.

The effect of decreasing offensive forces with fixed defenses is much like that of increasing defenses with fixed offenses as studied in "Crisis Stability." Both increase stability. Even moderate boost-phase defenses strongly attrit first-strike missiles. Preferential attrition by downstream interceptors reduces missile strikes on value is larger with defenses than without, because of the increased survivability of non-alert aircraft. Without defenses the fraction of the defender's Inter-Continental Ballistic Missiles (ICBMs) that survive the first strike is essentially zero. With defenses the number that survive and penetrate boost-phase defenses is significant, but the number that penetrate the preferential defenses downstream rapidly falls to zero. Without defenses the second-strike aircraft are limited to alert aircraft. With defenses the number is essentially the full number of aircraft, which is much larger. Without defenses the total restrike is the sum of missiles and alert aircraft; with defenses it is all of the aircraft. The cost for striking first without defenses differs, but other strike costs are clustered. With defenses the stability index rapidly goes to unity; without them the stability index remains lower throughout. With defenses, the expected number of missile weapons on value drops rapidly to zero; without defenses it remains high to low levels of offensive forces. This pattern holds for various combinations of defenses and attacks. Without defenses, offensive reductions could lead to large reductions in stability; with defenses, large reductions would increase stability. 3 refs.

19384 (LA-12298-MS) **Phase-space estimate of satellite coverage time.** Canavan, G.H. Los Alamos National Lab., NM (United States). May 1992. 6p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. Order Number DE92013555. Source: OSTI; NTIS; GPO Dep.

This note derives a phase-space estimate of the overlap in satellite coverage and evaluates its impact on the time for a constellation to cover some specified area. The satellites' motion is treated as random in the calculation of the overlaps. Enough passes are prescribed to assure that an adequate probability of observing each area is accumulated. For 0.9–0.99 probabilities of coverage, overlaps increase the time for coverage by factors of 2–4 over no-overlap estimates. This model also gives the probability of different vintages of data. If a given constellation covers the whole Earth in the no-overlap time T_0, the average vintage of the data over the earth will then be the average $\langle T \rangle$, which is essentially the same as T_0. Overlap over the poles might be wasteful, but overlap in areas of interest by inclined orbits just causes measurements to be more current in areas of interest.

19385 (LA-12299-MS) **Technical issues in theater missile defense.** Canavan, G.H. Los Alamos National Lab., NM (United States). May 1992. 8p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. Order Number DE92014176. Source: OSTI; NTIS; GPO Dep.

This note discusses technical issues in theater missile defenses in the terminal, midcourse, and boost phases. The first two are familiar and developed, but face fundamental countermeasures. Boost phase intercepts engage missiles when they are most vulnerable, but have been studied less for theater defense because the engagement times are short. Overall, theater missile defenses resemble strategic defenses, complicated by the tenfold shorter boost phase. 12 refs.

19386 (SAND–91-2155C) **A coilgun design primer.** Marder, B. Sandia National Labs., Albuquerque, NM (United States). [1991]. 12p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-76DP00789. (CONF-9204102–3: 6. symposium on electromagnetic launch technology, Austin, TX (United States), 28-30 Apr 1992). Order Number DE92011149. Source: OSTI; NTIS; GPO Dep.

This paper explains how an induction coilgun works and presents the factors which go into its design. Our purpose is to obtain algebraic expressions which, although crude, provide useful predictors of behavior, illustrate the dependence on various parameters, and suggest ways to optimize the design. Detailed prediction of the gun's behavior can be obtained from simulation codes, such as SLINGSHOT.

19387 (SAND–92-0460C) **Space applications for contactless coilguns.** Lipinski, R.J.; Beard, S.; Boyes, J.; Cnare, E.C.; Cowan, M.; Duggin, B.W.; Kaye, R.J.; Morgan, R.M.; Outka, D.; Potter, D.; Widner, M.M.; Wong, C. Sandia National Labs., Albuquerque, NM (United States). [1992]. 4p. Sponsored by USDOE, Washington, DC (United States); Department of Defense, Washington, DC (United States). DOE Contract AC04-76DP00789. (CONF-9204102–4: 6. symposium on electromagnetic launch technology, Austin, TX (United States), 28-30 Apr 1992). Order Number DE92011156. Source: OSTI; NTIS; GPO Dep.

Two space applications are considered for (electrically) contactless coilguns: launch of small satellites into low-earth orbit, and launch of lunar liquid oxygen (LLOX) from the moon to the stationary Lagrangian point L2. For the earth-to-orbit (ETO) application, the baseline conceptual design consists of a 960-m long gun sited in a tunnel at 25° inclination. The gun launches an 1820-kg package that includes a 100-kg satellite and a 650-kg boost rocket for orbital insertion. For the lunar application, the launcher is 200 m long. A 100-kg load of LLOX is packaged in a 10-kg fiber-wrapped tank, accelerated at 2 kgees in an aluminum bucket (armature), and launched at 2.33 km/s at 30-minute intervals. The canisters arrive at L2 2.97 days later and are captured by robotic tugs that deliver them to a fuel depot. The total mass of LLOX derived per year is 867 Mg (metric tons).

19388 (UCRL-CR–110115) **Notes for a tutorial on DEW signal generation, propagation, and detection.** Casey, K.F. (JAYCOR, Del Mar, CA (United States)). Lawrence Livermore National Lab., CA (United States); JAYCOR, Del Mar, CA (United States). Oct 1987. 122p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. Order Number DE92011847. Source: OSTI; NTIS; GPO Dep.

These notes were prepared to support a two-day tutorial lecture series which was presented at Headquarters, Air Force Foreign Technology Division in October 1987. The intent of the lectures was to provide an introduction to, and overview of, three subject areas relevant to the electromagnetic aspects of the Directed Energy Intelligence (DEWINT) problem. These areas are (1) signal generation by charged-particle beams (CPB) and high-power microwaves (HPM), (2) propagation of electromagnetic signals through the ionosphere, and (3) performance of correlation receivers for signal detection. The level of the material was intended to be suitable for an audience whose technical background was at the BS or MS level in electrical engineering or physics.

19389 (ANL/ESD/TM–23) **Removal and recovery of carbon disulfide emitted by the viscose process: Final report.** McIntosh, M.J. Argonne National Lab., IL (United States). Energy Systems Div. Feb 1992. 186p. Sponsored by USDOE, Washington, DC (United States); Illinois Dept. of Energy and Natural Resources, Springfield, IL (United States); Illinois State Government, Springfield, IL (United States). DOE Contract W-31109-ENG-38. Order Number DE92012160. Source: OSTI; NTIS; GPO Dep.

Teepak, Inc., which manufactures cellulose food casings by means of the viscose process, has a plant in Danville, Illinois, that emits approximately 400,000 cubic feet per minute (cfm) of water-saturated air containing approximately 100 parts per million (ppm) of carbon disulfide (CS_2). Both Teepak and the state of Illinois desire to reduce these emissions as soon as possible; however, the large air flow and very small CS_2 concentration result in a difficult and costly separations problem without an obvious economically viable solution. One possibility is to incinerate the CS_2, but a more environmentally and economically acceptable alternative is to recover the CS_2 for recycle to the process. The recovered CS_2 would be worth about $700,000 annually to Teepak. Teepak has sponsored, with the Hazardous Waste Research and Information Center (HWRIC) of the Illinois Department of Natural Resources, a research project at Argonne National Laboratory (ANL) to evaluate current gas- purification and recovery technology and to suggest a route of development that will lead to a CS_2 recovery process. The Illinois Department of Commerce and Community Affairs later provided on Illinois Challenge Grant to allow laboratory studies to supplement this effort. This report is a result of all those studies.

19390 (CONF-9103215–, pp. 163-169) **In-home performance of residential cordwood stoves.** Houck, J.E. (OMNI Environmental Services, Inc., Beaverton, OR (United States)); Barnett, S.G.; Roholt, R.B. USDOE Bonneville Power Administration, Portland, OR (United States). PNW and Alaska Bioenergy Program; Idaho Univ., Moscow, ID (United States). Dept. of Forest Products; Idaho Dept. of Water Resources, Boise, ID (United States). [1991]. From Small-scale bioenergy alternatives for industry, farm, and institutions: a user's perspective; Coeur d'Alene, ID (United States); 18-21 Mar 1991. In *Small-scale bioenergy alternatives for industry, farm, and institutions: A user's perspective.* 219p. Order Number DE92005481. Source: OSTI; NTIS; INIS.

The air quality impacts of residential cordwood stoves have been of concern to regulators, energy planners, and members of the woodstove industry. In addition, the reliability of laboratory certification emission values in predicting 'real world' emissions has been questioned. In response to these concerns, particulate emissions from residential cordwood stoves under actual in-home use have been measured for 5 heating seasons as part of 12 separate studies in Oregon, New York, Vermont, and the Yukon Territory. Monitoring was conducted using an automated emission sampler (AES) system. The system has been deployed in nearly 100 individual homes. Typically, emissions from several 1-week-long integrated sampling periods over the course of the heating season were measured with the AES system at each home. Particulate emission rates in grams of particles per hour of stove operation, grams of particles per kilogram of dry wood burned, and grams of particles per million Joules were calculated. Ancillary data provided by the studies included wood burn rates, homeowner wood loading patterns, wood moisture content and species, hours of operation of auxiliary heating appliances in the study homes, room ambient, flue gas, catalyst, and pre-catalyst temperatures, and hours of catalyst operation. Conventional stoves, high-technology non-catalytic stoves, catalytic stoves, and stoves equipped with retrofit catalytic devices have been studied. In addition to the 12 cordwood stove studies, the AES system has been used in 2 pellet stove studies and 1 fireplace study.

19391 (CONF-9105202–, pp. 11, Paper 6) **Modeling molecular processes in the environment.** Dunning, T.H. Jr (Pacific Northwest Lab., Richland, WA (United States)); Xantheas, S.S.; Hess, A.C.; Feller, D.F.; Kendall, R.A.; Ornstein, R.L. USDOE Office of Energy Research, Washington, DC (United States). Scientific Computing Staff. [1991]. DOE Contract AC06-76RL01830. From 1.

energy research power supercomputer users symposium; Gaithersburg, MD (United States); 21-22 May 1991. In *Proceedings of the first energy research power supercomputer users symposium.* 173p. Order Number DE91018877. Source: OSTI; NTIS; INIS.

The US Department of Energy is committed to a 30-year pan for environmental restoration at all of its sites. To meet these commitments DOE has organized an ambitious Research, Development, Demonstration, Testing and Evaluation program. The technical problems identified in the RDDT and E plan are extremely complex and require thorough, permanent and cost-effective solutions. Basic research lays the foundation for each step in the RDDT and E program, providing new knowledge and techniques for site characterization, needs assessment, innovative remediation technology, and post-remediation evaluation and monitoring. Theoretical and computational molecular science will play a critical role in developing molecular-level descriptions of the complex system found in the environment. Theory provides the conceptual framework for the analysis and interpretation of experimental data. Modeling and simulation provides quantitative information which may be expensive, difficult or impossible to obtain in the laboratory. Further, theory, modeling and simulation provides insights into the fundamental factors governing molecular structure and dynamics which cannot be obtained from experiment alone.

19392 (CONF-9105202–, pp. 12, Paper 8) **Cloud radiative forcing: A modeling perspective.** Potter, G.L. (Lawrence Livermore National Lab., Livermore, CA (United States)); Slingo, J.M.; Morcrette, J.J. USDOE Office of Energy Research, Washington, DC (United States). Scientific Computing Staff. [1991]. DOE Contract W-7405-ENG-48. From 1. energy research power supercomputer users symposium; Gaithersburg, MD (United States); 21-22 May 1991. In *Proceedings of the first energy research power supercomputer users symposium.* 173p. Order Number DE91018877. Source: OSTI; NTIS; INIS.

In order to produce a projection of future climate, models used for climate research must produce realistic cloud amount, cloud structure and cloud radiative properties. To this end, a series of simulations were performed at the Program for Climate Model Diagnosis and Intercomparison (PCMDI) at LLNL using the supercomputer resources at NERSC to help determine why different climate models produce different cloud feedbacks. The simulations were designed to first facilitate model validation with a high resolution model and second, to evaluate methods for model intercomparison.

19393 (CONF-9110375–, pp. 213-216) **Studies on environmental risk assessment on mercury contained in flue gas from incineration plants.** Terashima, Y. (Kyoto Univ., Kyoto (Japan). Faculty of Engineering); Sogabe, H.; Shimizu, Y. Japan Society of Waste Management Experts, Tokyo (Japan). 28 Oct 1991. 488p. (In Japanese). From 2. annual conference of The Japan Society of Waste Management Experts (JSWME); Tokyo (Japan); 28-30 Oct 1991. In *Proceedings of the 2nd annual conference of the Japan society of waste management experts.* Order Number DE92514163. Source: OSTI; NTIS (US Sales Only).

This paper prsents the framework for a risk assessment on toxic substances generated from waste disposition. The framework was applied to mercury discharged into atmosphere from incineration plants to evaluate its effects through lung respiration and oral intake of drinking water. The highest surface landing concentration was 12.1 ng/m^3 at a point with distance of 8.5 km from the discharging source, located leeward of the source, the most frequent wind direction. This value is thought to have a small effect on the environment when compared to the guideline value of 15μg/m^3 recommended by WHO and the ordinary mercury concentration in general atmosphere. A value of mercury concentration in soil at the point of the highest surface landing concentration from the precipitated flux was calculated at 0.114 mg/kg. This value is slightly larger than the background concentration of 0.1 mg/kg in non-polluted soil, which causes a concern about its effect on the environment as a result of discharge and accumulation over a long period of time. 5 refs., 3 figs., 2 tabs.

19394 (CONF-9203118–1) **Parallel algorithms for the spectral transform and semi-lagrangian transport methods.** Drake, J.B. (Oak Ridge National Lab., TN (United States)); Williamson, D.L.; Foster, I. Oak Ridge National Lab., TN (United States). 17 Mar 1992. 3p. Sponsored by USDOE, Washington, DC (United States). Short communication. CLIMATE MODELS/iterative methods; ITERATIVE METHODS/parallel processing; ALGORITHMS; ARRAY PROCESSORS

19395 (CONF-920444–26) **Searching for perchloric acid salts in laboratory hoods at Oak Ridge National Laboratory.** Phillips, C.C.; Bader, M.; Haskew, M.W.; Mueller, T.R.; Stewart, J.H. Jr.; Vick, D.O.; Watkins, R.M. Oak Ridge National Lab., TN (United States). [1992]. 3p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. From American Chemical Society national meeting; San Francisco, CA (United States); 5-10 Apr 1992. Order Number DE92011788. Source: OSTI; NTIS; GPO Dep.

In the 50 years that Oak Ridge National Laboratory (ORNL) has been conducting energy research, many operations have involved the use of hot perchloric acid in laboratory hoods. The salts resulting from such operations, if accumulated in these systems, can possible lead to flammable and explosive conditions, placing users and maintenance personnel at risk. In 1991, ORNL initiated a study to determine whether these hoods and exhaust systems were contaminated with perchlorate salts. A perchloric acid committee was established at ORNL consisting of industrial hygienists, chemists, engineers, and health physicists, as well as personnel from industrial safety, fire protection, and environmental compliance. The committee was tasked to identify systems where perchloric acid had been used, determine associated risks, and make recommendations for abatement procedures. The study was divided into a five-phase approach: (1) identification of hoods and systems currently and historically used for hot perchloric acid procedures (questionnaire survey); (2) development of evaluation procedures (testing and analytical); (3) actual testing/sampling of suspect/confirmed hoods; (4) analysis of results of samples (determination of risks and acceptable contamination level); and (5) development of decontamination procedures (purpose to decontaminate, repair, and remove if necessary).

19396 (CONF-920527–2) **Laboratory measurements of metal adsorption from simulated incinerator flue gases: Sorbent selection for cesium capture.** Crosley, S.M.; Kedl, R.J. Oak Ridge National Lab., TN (United States). [1992]. 9p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. From Incineration conference; Albuquerque, NM (United States); 11-14 May 1992. Order Number DE92013287. Source: OSTI; NTIS; INIS; GPO Dep.

The Environmental Protection Agency (EPA) has proposed that the emission of acid gases, particulates, and ten specific metals in the flue gas of incineration be regulated. In addition, the Department of Energy is interested in minimizing the emission of radioactive metals in such flue gas. Dry scrubbing is an attractive alternative to wet scrubbing for the removal of these materials. Laboratory-scale experiments were conducted to measure the adsorption of cesium by silica at 1000–1300°F. Silica was found to be an effective sorbent for cesium. A methodology was developed for pre-selecting suitable sorbents for specific metals for future testing.

19397 (DOE/EA–0542) **Environmental assessment for the Cheap Access to Orbit (CATO) (formerly Super High Altitude Research Project-SHARP) at the Lawrence Livermore National Laboratory.** USDOE Assistant Secretary for Defense Programs, Washington, DC (United States). Jan 1992. 22p. Sponsored by USDOE, Washington, DC (United States). Order Number DE92012183. Source: OSTI; NTIS; GPO Dep.

Advanced Applications, a Division of Laser Programs at LLNL, is proposing to conduct Cheap Access to Orbit (CATO) experimental tests at Site 300 High Explosives Test Facility. CATO will utilize a two-stage light gas gun to propel projectiles (consisting of non-explosive light metals and polymers) of up to 10 kg (26 lb) at velocities up to 7 km/s (4 mi/s) with methane and hydrogen serving as propellants. The purpose of CATO is to test the cost-effectiveness and particality of using a two-stage light gas gun to place metric-ton payloads into earth orbits. There is a need to reduce the cost for constructing and maintaining orbital systems for national defense interests, space exploration, and development of worldwide communications and information systems. Potential environmental, safety, and health effects are associated with CATO. Noise and ground motion associated with gun firings, air emissions resulting from combustion of a methane-air mixture and hydrogen, energy consumption, and hazardous waste generation from post-firing, gun-tube wipedown are direct results from operation of the CATO gun. Noise and shock will be mitigated by special construction features (e.g., construction of a berm and gun design features) at the gun location. Air emissions are 84% nitrogen and water and 14% carbon dioxide and do not present a significant environmental concern. A thorough review by LLNL's health and safety professionals assures operational safety (LLNL, 1990). The test experiment will comply with applicable environmental, health, and safety regulations and will employ good engineering and construction practices. Potential off-site impacts will be mitigated by a thorough engineering and safety peer review that will continue through the modifications to the experimental design during scaleup of the experiment during the first year.

19398 (DOE/EA-0546) **Building 12-42F modification, Pantex Plant, Amarillo, Texas: Final Environmental Assessment.** USDOE Assistant Secretary for Environment, Safety, and Health, Washington, DC (United States). Feb 1991. 15p. Sponsored by USDOE, Washington, DC (United States). Order Number DE92012266. Source: OSTI; NTIS; INIS; GPO Dep.

The Environment Assessment (EA) has been prepared pursuant to the implementing regulations to the National Environmental Policy Act (NEPA), which require federal agencies to assess the environmental impacts of a proposed action to determine whether that action requires the preparation of an Environmental Impact Statement (EIS) or if a Finding of No Significant Impact (FONSI) can be issued. NEPA requires that an EA provide an interdisciplinary review of the proposed action in order to identify possible preferable alternatives and to identify mitigative measures that will prevent environmental impacts. If it is determined that the proposed action will have unavoidable significant environmental impact, then as EIS shall be prepared. The proposed project is to modify Building 12-42F and entry into the Sandia Pantex Weapons Evaluation Test Laboratory. The modification's primary function is to provide additional space for testing and monitoring equipment to support the activities in the existing Building 12-42F. The modification will also facilitate the reconfiguration of the personnel offices, break room and conference area. The proposed Building 12-42F modification relates to the interiors of Buildings 12-42F and 12-42A. These buildings contain a centrifuge and associated testing and monitoring equipment. The proposed addition will encompass the existing entry into Building 12-42A. Building 12-42A will be accessed through the proposed Building 12-42F modification.

19399 (DOE/ER-0541T) **Computer Hardware, Advanced Mathematics and Model Physics pilot project final report.** USDOE Office of Energy Research, Washington, DC (United States). Office of Health and Environmental Research. May 1992. 126p. Sponsored by USDOE, Washington, DC (United States). Order Number DE92013750. Source: OSTI; NTIS; INIS; GPO Dep.

The Computer Hardware, Advanced Mathematics and Model Physics (CHAMMP) Program was launched in January, 1990. A principal objective of the program has been to utilize the emerging capabilities of massively parallel scientific computers in the challenge of regional scale predictions of decade-to-century climate change. CHAMMP has already demonstrated the feasibility of achieving a 10,000 fold increase in computational throughput for climate modeling in this decade. What we have also recognized, however, is the need for new algorithms and computer software to capitalize on the radically new computing architectures. This report describes the pilot CHAMMP projects at the DOE National Laboratories and the National Center for Atmospheric Research (NCAR). The pilot projects were selected to identify the principal challenges to CHAMMP and to entrain new scientific computing expertise. The success of some of these projects has aided in the definition of the CHAMMP scientific plan. Many of the papers in this report have been or will be submitted for publication in the open literature. Readers are urged to consult with the authors directly for questions or comments about their papers.

19400 (DOE/ER/60314-10) **Analysis of general circulation model results and comparison with regional climatic data, Task 3: [Progress report].** Cess, R.D.; Hameed, S. State Univ. of New York, Stony Brook, NY (United States). Inst. for Atmospheric Sciences. [1989]. 6p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG02-85ER60314. Order Number DE92011602. Source: OSTI; NTIS; GPO Dep.

On time scales of greater than one year the variability of weather and climate on a large path of the Earth is dominated by the Southern Oscillation. While current theories of this phenomenon have clarified the role of the interaction between the ocean and the atmosphere in maintaining this oscillation it has so far been unclear whether the Southern Oscillation originates in the ocean, in the atmosphere or during the interaction between the ocean and the atmosphere. In this study we compared simulations of climate in two global circulation models: the coupled OSU GCM in which the atmosphere and ocean interact dynamically and the slab OSU GCM in which the ocean is represented by a static layer.

19401 (DOE/ER/60314-T3) **Comparisons of model simulations of climate variability with data, Task 2: [Progress report].** State Univ. of New York, Stony Brook, NY (United States). [1990]. 43p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG02-85ER60314. Order Number DE92011601. Source: OSTI; NTIS; GPO Dep.

Significant progress has been made in our investigations aimed at diagnosing low frequency variations of climate in General Circulation Models. We have analyzed three versions of the Oregon State University General Circulation Model (OSU GCM). These are: (1) the Slab Model in which the ocean is treated as a static heat reservoir of fixed depth, (2) the coupled upper ocean-atmosphere model in which the ocean dynamics are calculated in two layers of variable depths representing the mixed layers and the thermocline; this model is referred to OSU2 in the following discussion, and (3) the coupled full ocean-atmosphere model in which the ocean is represented by six layers of variable depth; this model is referred to as OSU6 GCM in the discussion.

19402 (DOE/ER/61072-2) **Development of rotating shadowband spectral radiometers and GCM radiation code test data sets in support of ARM: Technical progress report.** Michalsky, J.; Harrison, L. State Univ. of New York, Albany, NY (United States). Atmospheric Sciences Research Center. 17 Mar 1992. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG02-90ER61072. Order Number DE92011438. Source: OSTI; NTIS; GPO Dep.

Two tasks are included in the second year of this project. One task continues the collection of high quality data sets for the testing of radiation codes within climate models. The other task involves the development of accurate spectral instruments for the measurement of shortwave radiation. A third task was completed in the second half of the first year of the project and will be briefly summarized.

19403 (DOE/ER/61219-1) **Exploitation of parallelism in climate models: [Annual] report, 1 September 1991-29 February 1992.** Baer, F.; Tribbia, J.J.; Williamson, D.L. Maryland Univ., College Park, MD (United States). [1992]. 9p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG05-91ER61219. Order Number DE92012595. Source: OSTI; NTIS; INIS; GPO Dep.

The US Department of Energy (DOE) through its CHAMMP initiative, hopes to develop the capability to make meaningful regional climate forecasts on time scales exceeding a decade, such capability to be based on numerical prediction type models. We propose research to contribute to each of the specific items enumerated in the CHAMMP announcement (Notice 9103); i.e., to consider theoretical limits to prediction of climate and climate change on appropriate time scales, to develop new mathematical techniques to utilize massively parallel processors (MPP), to actually utilize MPP's as a research tool, and to develop improved representations of some processes essential to climate prediction. To explore these initiatives, we will exploit all available computing technology, and in particular MPP machines. We anticipate that significant improvements in modeling of climate on the decadal and longer time scales for regional space scales will result from our efforts. This report summarizes the activities of our group during a part of the first year's effort to meet the objectives stated in our proposal. We will comment on three research foci, time compression studies, subgrid scale model studies, and distributed climate ensemble studies and additional significant technical matters.

19404 (DOE/ER/61220–1) **Development of an advanced representation of cumulus convection: Progress report.** Emanuel, K.A. Massachusetts Inst. of Tech., Cambridge, MA (United States). [1992]. 4p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG02-91ER61220. Order Number DE92011031. Source: OSTI; NTIS; GPO Dep.

Development of the new representation of cumulus convection, emphasizing the role of microphysical parameters, was completed. The newly developed cumulus scheme was coupled with a detailed representation of radiative transfer, in the context of a one-dimensional radiative-convective equilibrium model that includes the ocean as part of the calculations. The adjustable parameters of the scheme are microphysical in nature. They include the parcel precipitation efficiencies, ϵ_i, which are defined as the fraction of condensed water converted to precipitation in samples of air lifted reversibly from the subcloud layer; σ_d, the areal fraction covered by unsaturated downdraft; and σ_s, the fraction of precipitation assumed to fall outside of cloud.

19405 (EUR–12503(v.4)) **Development of modelling and forecasting in geology (Volume 4): Actual climates representative of past climates: Basis of bio-climate model.** Courbouleix, S. (Bureau de Recherches Geologiques et Minieres (BRGM), 45 - Orleans (France)); Colleau, A.; Defaut, B.; Fourniguet, J.; Peaudecerf, P. Commission of the European Communities, Luxembourg (Luxembourg). 1990. 55p. (In French). Contract FI1W/0048-F. Source: OSTI; NTIS (US Sales Only).

To access the long-term safety of radioactive waste disposal systems, validation of predictive models is essential and large efforts should be given to barriers, particularly geologic barriers. This work appears in the form of four volumes, the subject of the fourth part is described below. The purpose of this study is to find actual climates which can represent past climates in Europe, during Plio-Quaternary Palynology technics is the most adapted to restore ancient climates. A climatic index, Q_n is defined as a function of yearly rainfalls, monthly extreme temperatures and aridity. A climatic diagram is built with climatic index Q_n along X axis and a function of the yearly mean temperature along Y axis. This original method can ensure vegetation determination from climate and vice versa. Erosion and Weathering values may be determined after model calibration. 23 figs., 21 refs.

19406 (GKSS–90/E/13) **Remote sensing of tropospheric water vapor and carbon dioxide height profiles by use of a Raman lidar.** Riebesell, M. (GKSS-Forschungszentrum Geesthacht GmbH, Geesthacht-Tesperhude (Germany). Inst. fuer Physik). GKSS-Forschungszentrum Geesthacht GmbH, Geesthacht-Tesperhude (Germany); Hamburg Univ. (Germany). Fachbereich 12 - Physik. 1990. 127p. (In German). Order Number DE92516553. Source: OSTI; NTIS (US Sales Only).

This dissertation describes a lidar system for the height-resolved determination of tropospheric water vapor and carbon dioxide mixing ratios. The measurement is based on the detection of the backscattered Raman radiation following the transmission of a laser pulse. The apparatus was built and its properties were investigated. Profiles of both H_2O and CO_2 could be obtained, but the required precision of ±1 ppm CO_2 can not yet be achieved because of a fluorescence background which is hard to quantify with the present measurements system. Height profiles of water vapor can be measured to about 8 km. Radiosonde comparison measurements show excellent agreement. With the atmospheric extinction coefficient determined from the oxygen Raman signal, the different atmospheric attenuation of backscattered light of the signal and reference wavelengths can be corrected for. (orig.) With 63 figs., 17 tabs.

19407 (GSF-HY–1/91, pp. 125-134) **Study into the isotope stratigraphy of a 16 m deep firn core from the Russian station Druzhnaya-1, Filchner shelf ice, (Antarctica).** Graf, W.; Moser, H.; Reinwarth, O.; Rauert, W. GSF - Forschungszentrum fuer Umwelt und Gesundheit GmbH, Neuherberg (Germany). Inst. fuer Hydrologie. Oct 1991. (In German). In *Annual report 1990 of the GSF Institute of Hydrology.* 182p. Order Number DE92511426. Source: OSTI; NTIS (US Sales Only); INIS.

The tritium accumulation was measured in annual samples derived after a first stratigraphic evaluation of the 0-18 and deuterium profiles. This method is sufficient for the purpose of isotopic dating, as the high tritium accumulations of the years 1965 and 1966 are clearly detectable as time marks. The calculated accumulation rates of the years 1952 through 1985 show a relatively strong variation. From the empirical δ 0-18 temperature relationship, an averaged warming of ground air by 0.057 K/year can be derived for the Druzhnaya-1 site for the period 1952 through 1980. (DG).

19408 (GSF-HY–1/91, pp. 156-157) **Krypton-85 concentrations in the atmosphere.** Schuhbeck, S.; Rauert, W. GSF - Forschungszentrum fuer Umwelt und Gesundheit GmbH, Neuherberg (Germany). Inst. fuer Hydrologie. Oct 1991. (In German). In *Annual report 1990 of the GSF Institute of Hydrology.* 182p. Order Number DE92511426. Source: OSTI; NTIS (US Sales Only); INIS.

The 1990 annual average of atmospheric Kr-85 is reported from the measuring stations Neuherberg (1.11 Bg/m^3) and Mappenberg (1.16 Bg/m^3). These values show an increase by 1.2% or 0.7%, respectively, as compared to the previous year. (DG).

19409 (IFE/KR/E–92/002) **Worldwide status of long range atmospheric transportation models for use in emergency situations.** Tveten, U. Institutt for Energiteknikk, Kjeller (Norway). Feb 1992. 17p. Order Number DE92627916. Source: OSTI; NTIS (US Sales Only); INIS.

This report contains the results of the work of a working group put together in order to summarize the status of long range atmospheric transportation models for use in an emergency situation in real-time mode. The most important characteristics of the various models are summarized. The models in use in the Nordic countries as well as a couple of non-Nordic models are presented in more detail. A discussion of the desired characteristics of real-time models (also referred to as Emergency Response Assisting Systems) is included.

19410 (INIS-GB–435) **Sixth annual report of RADMIL 1990/91.** Radioactivity Monitoring in Lancashire (RADMIL), Lancaster (United Kingdom). 1991 123p. Order Number DE92628023. Source: OSTI; NTIS (US Sales Only); INIS.

This sixth annual report of RADMIL draws together all parts of the programme of monitoring of radiation and radioactivity in Lancashire from April 1990 to March 1991, including work on radon and intertidal areas, which in previous years has been published separately, and measurements relating to internal exposure from airborne particulates and foodstuffs, i.e. milk, meat, aquatic foods, vegetables etc. (UK).

Source: OSTI; NTIS (US Sales Only); INIS.

Two types of radionuclides contained in the atmosphere are studied including inert radioactive gas ^{85}Kr possessing no chemical bonds at normal temperatures and dissolved in water, and radioactive iodine isotopes possessing multiple chemical bonds under the same conditions and wide possibilities of penetration to the earth hydrosphere. It is shown that with regard to expected nuclear power progress and respective increase of ^{85}Kr concentration in the surface atmosphere layer the ion production near the Earth can achieve the value of 5.0 ion/(cm^{3}xs), this, in its turn, changes notably the electric conductivity in the lower troposphere and leads to the reduction of the total negative charge of the planet and decrease of sedimentation in equatorial and pre-equatorial regions of the Earth where sediments are linked with storm formation. Investigation into radioactive iodine isotopes, and especially ^{129}I, has shown that these isotopes are the products of the nuclear fuel cycle plant releases. They actively penetrate to the atmosphere and remain in all geospheres of the Earth and participate in all processes occuring in them due to multiple chemical bonds. A conclusion is made about the necessity in the nature dosimetry and its protection against pollution. 5 refs.; 3 figs.

19417 (INIS-SU--313, pp. 66-69) **Hot particles at the territory of the Lithuanian SSR.** Luyanas, V.; Shpirkauskajte, N.K.; Yasyulenis, R.Yu.; Adlis, G.I. To investigate a possibility of hot alpha- and beta-particle presence in the air after the Chernobyl accident, exposure of filters containing atmospheric aerosols in contact with nuclear A-2 type emulsion is conducted. It is shown that the maximum hot beta-particle concentration in the air of Vilnius was observed 28-29.04.86. Study of few alpha-particle traces allows one to assume that ^{239}Pu, ^{233}U, ^{23}'4U, ^{235}U, ^{242}Cm, ^{214}Po are present in them. In some particles only ruthenium radioisotopes are observed. 3 refs.; 2 tabs.

19418 (INIS-SU--313, pp. 82-89) **Measuring technique for aerosol and gas components of iodine isotopes in the air.** Nedvetskajte, T.N.; Filistovich, V.I. AN SSSR, Moscow (USSR); AN Litovskoj SSR, Vilnius (USSR). Inst. Fiziki. 1988. 91p. (In Russian). (CONF-8804342--: Working conference on experience and problems of optimization of dosimetric measurements and organizing of the regional system of radioecological monitoring, Vilnius (USSR), 20-22 Apr 1988). In *Experience and problems of optimization of dosimetric measurements and organizing of the regional system of radioecological monitoring.* Order Number DE92001358. Source: OSTI; NTIS (US Sales Only); INIS.

The AGI sampler for aerosol and gas iodine isotope components is developed, tested and introduced at the Physical Institute of the Lithuanian Academy of Sciences to determine the radioactive iodine isotope concentration in the atmospheric air with regard to differen forms of their aggregate state. After the Chernobyl accident the quantity of radioactive iodine isotopes in the air medium is determined using the AGI. Substantial quantities of I^{131}I and'1^{32}I and ^{133}I traces in aerosol and gas forms are detected. 5 refs.; 5 figs.; 1 tab.

19419 (JSR--91-330A) **Small satellites and RPAS in global-change research: Summary and conclusions.** Banks, P.; Cornwall, J.M.; Dyson, F.; Fortson, N.; Koonin, S.; Max, C.; MacDonald, G.; Ride, S.; Ruderman, M.; Treiman, S.; Vesecky, J.; Westervelt, R.; Zachariasen, F. Mitre Corp., McLean, VA (United States). Jason Program Office. Jan 1992. 25p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AI05-90ER30174. Order Number DE92013602. Source: OSTI; NTIS; INIS; GPO Dep.

JASON has now conducted two studies on the use of small satellites and remotely-piloted aircraft (RPAs) in global change research, with special reference to the DOE Atmospheric Radiation Measurement (ARM) program and to DARPA's Small Satellite program. The studies centered around meetings, one in January and the other in June 1991, to which we invited representatives of all areas of the global change program and of the DOD satellite science and technology community. We have already issued a report on the January study. Here we summarize the main themes and results of our Summer Study; the full report will be issued shortly.

19420 (Juel--2512) **Contributions to the environmental specimen bank. Pt. 7. Development and application of an automatic hydride method for arsine enrichment for the determination of arsenic compounds in algae, mussels and sea water with the HPLC. Investigation of different arsenic compounds in marine organisms of the German North Sea coast and Baltic Sea coast; comparison with specimens from Antofagasta, Chile.** Arenas C, V.J. Forschungszentrum Juelich GmbH (Germany). Inst. fuer Chemie 4 - Angewandte Physikalische

Chemie; Bonn Univ. (Germany). Aug 1991. 186p. (In German). Order Number DE92511438. Source: OSTI; NTIS (US Sales Only).

In environmental analysis, total arsenic analysis is not sufficient since the toxicity of the arsenic depends on the compound form. For the determination of the respective compound form, a sensitive hydride AAS method for arsenic concentrations was developed in the ng and pg range together with an extraction technique for different arsenic compounds from marine organisms. The HPLC was selected and optimized as separation method; the different arsenic compounds which remain in the extract according to the extraction of the biological specimens were separated and analyzed. The total technique was used for the investigation of algae, mussels and water specimens of the North Sea and Baltic Sea and the Pacific (coast of Chile). The results were compared and discussed. (BBR).

19421 (KIYal–90-46) **The problem of creation of radiation monitoring system.** Pilipchak, S.I. AN Ukrainskoj SSR, Kiev (Ukraine). Inst. Yadernykh Issledovanij. 1990. 14p. (In Russian). Order Number DE92626188. Source: OSTI; NTIS (US Sales Only); INIS.

The review of problem of radiation monitoring system (RMS) in the territory of the country is presented. Unsolved problems are discussed which are divided into three groups: the organization of structures in RMS; implementation of automated RMS; the solution of scientific problems of global monitoring of radiation situation. 12 refs.; 1 tab.

19422 (LA–12271-MS) **Environmental surveillance at Los Alamos during 1990.** Los Alamos National Lab., NM (United States). Mar 1992. 336p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. Order Number DE92011705. Source: OSTI; NTIS; INIS; GPO Dep.

This report describes the environmental surveillance program conducted by Los Alamos National Laboratory during 1990. Routine monitoring for radiation and radioactive or chemical materials is conducted on the Laboratory site as well as in the surrounding region. Monitoring results are used to determine compliance with appropriate standards and to permit early identification of potentially undesirable trends. Results and interpretation of data for 1990 cover external penetrating radiation; quantities of airborne emissions and effluents; concentrations of chemicals and radionuclides in ambient air, surface waters and groundwaters, municipal water supply, soils and sediments, and foodstuffs; and environmental compliance. Comparisons with appropriate standards, regulations, and background levels provide the basis for concluding that environmental effects from Laboratory operations are small and do not pose a threat to the public, Laboratory employees, or the environment.

19423 (LA-UR–92-949) **Small satellite radiation budget instrumentation.** Weber, P.G. Los Alamos National Lab., NM (United States). [1992]. 11p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-9204112–1: 2. small satellite technology and applications, Orlando, FL (United States), 20-24 Apr 1992). Order Number DE92011134. Source: OSTI; NTIS; GPO Dep.

A major diagnostic in understanding the response of the Earth's climate to natural or anthropogenic changes is the radiative balance at the top of the atmosphere. Two classes of measurements may be undertaken: (1) a monitoring of the radiation balance over decade-long long time-scales, and (2) measurements designed to provide a sufficiently complete data set to validate or improve models. This paper discusses some of the important ingredients in obtaining such data, and presents a description of some candidate instrumentation for use on a small satellite. 23 refs.

19424 (LBL–31214) **Comparison of measurements of aerosol elemental carbon at Wrangel Island, USSR, and Barrow, Alaska.** Polissar, A.V. (AN SSSR, Moscow (USSR). Inst. Fiziki Atmosfery); Kapustin, V.N.; Hansen, A.D.A. Lawrence Berkeley Lab., CA (United States). Aug 1991. 7p. Sponsored by USDOE, Washington, DC (United States); National Oceanic and Atmospheric Administration, Washington, DC (United States). DOE Contract AC03-76SF00098. (CONF-9110357–1: European aerosol conference, Karlsruhe (Germany), 28-31 Oct 1991). Order Number DE92010295. Source: OSTI; NTIS; GPO Dep.

During the winter and spring seasons of 1989 and 1990, we collected samples of the background aerosol at Wrangel Island in the eastern Soviet Arctic. The samples were analyzed by optical transmission to determine the concentration of aerosol "black" carbon (BC), with results ranging from 5 to 167 nanograms per standard cubic meter. These results are compared with the continuous measurements at the NOAA/CMDL monitoring station at Barrow, Alaska for cases when meteorological trajectories connected the two locations with transit times of from one to two days. The preliminary results suggest that concentrations of aerosol BC are reduced at Wrangel relative to Barrow.

19425 (LIS–97) **Notes and demands on the safety of activated carbon filters at waste incineration plants subjected to the German Hazardous Incident Ordinance (12. BlmSchV).** Hansmann, G.; Wefers, H. Landesanstalt fuer Immissionsschutz des Landes Nordrhein-Westfalen, Essen (Germany). 1991. 56p. (In German). Order Number DE92516792. Source: OSTI; NTIS (US Sales Only).

For many waste incineration plants, the emission limit values set in the 17th Ordinance for the Implementation of the German Law for Air Pollution Control and Noise Abatement of 1990 require additional measures for flue gas cleaning. One technique to keep the limit values for heavy metals, dioxins and furans is the adsorptive gas cleaning in an activated carbon filter. Such filters work by sorbent injection into a fluidised bed reactor or a flue gas duct followed by a fibre filter or as moving bed adsorber. This report contains notes and demands on the safety of activated carbon filters at waste incineration plants subjected to the German Hazardous Incident Ordinance (12. BlmSchV). Measures are shown to prevent and to limit the effects of fires, explosions and of toxic gas or dust emissions. Thus the report should assist the fulfilment of the safety duties according to the Hazardous Incident Ordinance. Furthermore it should help to produce, check and assess any necessary safety reports. (orig.).

19426 (NEI-DK–780) **SNOX system.** NEFO Vendsysselvaerket I/S, Vodskov (Denmark). [1991] 21p. (In Danish). Order Number DE92506309. Source: OSTI; NTIS (US Sales Only).

On May 23, 1984, the Danish government passed a law (no.251) on the reduction of sulphur dioxide emission. Since then a new law has been passed which also demands the reduction of nitrogen oxides. Total emission must be halved before the year 2005, this means that emission must be cleaned to the degree of 75%. The Danish electric power company "ELSAM" has constructed a "SNOX" system for flue gas cleaning to reduce emission of both sulphur dioxide and nitrogen oxides for a large Danish power station named "Vendsysselvaerket". This system is described in detail and the text is illustrated with diagrams and photographs. The advantages of the system, it is claimed, is that, in addition to the removal of SO_2 and NO_x , there is no waste water, no dust emission, NH_3 is the only additive, the waste products can be sold and it is robust and economical to operate. (AB).

19427 (NEI-DK–795) **Dispersion studies on Gran Canaria and Tenerife: Model calculations.** Thykier-Nielsen, S.; Mikkelsen, T. Risoe National Lab., Roskilde (Denmark). Nuclear Safety Research Dept.; Risoe National Lab., Roskilde (Denmark). Meteorology and Wind Energy. Dec 1991 32p. Order Number DE92506328. Source: OSTI; NTIS (US Sales Only).

The purpose was to evaluate dispersion model results calculated for two power plants to be build in the coastal zone on the Spanish islands Grand Canary and tenerife by the RISOe models LINCOM/RIMPUFF. The main objective was to quantitative estimate worst case scenarios of the ground level average concentration of SO_2 resulting from emissions of blocks of new projected power plants on these islands. Of particular relevance is the proximity of the main tourist areas, the immediate local populations and the effect of the air orne pollutants on both the extensive arable cultivation and the rare flora. Assessments showed maximum 2-hour ground level mean-concentrations in the vicinity of 340 μgrams/m^3, and daily-averaged dose ranging from 10 - 100 μgrams/m^3. The maximum ground level concentration were found near the power plants within distances of 1 to 3 km downwind. At longer ranges, out to 10 km or so, the topography of the islands significantly veered the mean flow and thereby the plumes, but according to our isoline calculations the modification of the flow did not give rise to secondary maxima in the mean concentration field. Higher 2- hour mean concentrations might occur during special meteorological conditions, but presumably this will only happen during fumigation, building wake down drafts and plume/hillside impingements. Higher concentrations,- some even likely to exceed the 700 $\mu g/m^3$ level, may occur during short periods at exposed locations and at locations near the power plant sites during transitional meteorology. (AB) 16 refs.

19428 (NEI-DK–799) **The reaction between sulphur dioxide and ammonia in flue gas.** Hjuler, K. Danmarks Tekniske Hoejskole, Lyngby (Denmark). Inst. for Kemiteknik. Jul 1991 184p. Order Number DE92506339. Source: OSTI; NTIS (US Sales Only).

Formation of aerosols and scaling of process equipment and monitoring systems are examples of problems related to the use of ammonia in desulfurization and denitrification processes. The reaction between sulphur dioxide and ammonia in flue gas has been studied in simulated and real flue gases using 1.5-12.0 mm internal diameter laboratory plug flow reactors and flows ranging from 0.5-4.0 Nl/min. The reaction temperature, sulphur dioxide concentration and ammonia concentration was 40-80 deg. C, 60-1000 ppm and 120-2000 ppm, respectively. The water content of the gas was typically 6 vol-% and the oxygen content 5 vol-%. Diffusion of the reactants from bulk phase to the reactor wall had minor influence on the observed rate of reaction. The initiation step of the reaction is sensible to surface characteristics. Once initiated, no influence of the reactor construction material is observed, but temperature hysteresis phenomena appears. Formation of aerosols have not been indicated. An overall mechanism for the reaction involving two intermediary species in proposed, and a simple three parameter expression for the reaction rate was developed from the mechanism. The model may be applied in designing ammonia based dry or semi-dry desulphurization processes. A semi-dry application of ammonia for flue gas desulphurization was investigated. The application was interesting due to the possiblity of studying the effect of a relatively low reaction temperature, and of using various additives and materials. Procedures for flue gas sampling and continuous measurement of ammonia were developed for the simultaneous monitoring of sulphur dioxide and amonia concentrations in flue gases. (AB) 75 refs.

19429 (NEI-DK–800) **Sulphur capture in fluidized bed combusters.** Binderup Hansen, P.F. Danmarks Tekniske Hoejskole, Lyngby (Denmark). Inst. for Kemiteknik. May 1991 251p. Order Number DE92506338. Source: OSTI; NTIS (US Sales Only).

An experimental study of the reactions related to sulphur capture by natural limestone during fluidized bed combustion is described. Experimental investigations were carried out in specially developed electrically heated laboratory scale fixed bed reactor. Under oxidizing conditions sulphur is captured as $CaSO_4$. Under reducing conditions in the presence of CO, sulphur is captured as CaS. When H_2 is used instead of CO as reducing agent the rate of reductive decomposition of formed $CaSO_4$ increases and no formation of CaS is observed. Using CH_4 neither reductive decomposition of $CaSO_4$ nor formation of CaS was observed. The mechanism explains the main reason for the temperature optimum observed for desulphurization in fluidized bed combusters which appears to be caused by the competition between sulphur capture and sulphur release, the latter of which becomes increasingly important at high temperature. The sulphur capacity of 14 European limestones were studied under oxidizing and alternating conditions. Fe_2O_3 lowers the sulphur capacity significantly under alternating conditions. Reduction in particle size seems to increase the SO_2 release due to CaS oxidation but decreases the emission of SO_2 due to reductive decomposition of $CaSO_4$. Both phenomenous may lead to a reduced flue gas desulphurization in real combusters. The influence of desulphurization on the nitrogen chemistry in fluidized bed combusters was studied qualitatively. CaS, is shown to be a strong catalyst for NO and N_2O reduction by CO. N_2O is oxidized to NO during the rapid and highly exothermal oxidation of CaS. (AB) 140 refs.

19430 (NEI-DK–804) **Testing of dust monitors at low concentrations.** Johansen, L.P. Danske Elvaerkers Forening, Copenhagen (Denmark). Kraftvaerkernes Miljoeudvalg, Stofemissionsgruppen. [1991] 57p. (In Danish). Order Number DE92506329. Source: OSTI; NTIS (US Sales Only).

Monitors which continually register dust concentration at a power plant in Studstrup, in Denmark, were tested in order to ascertain their suitability for measuring concentrations of less than 10 mg per cubic meter. The trade names of the monitors are Environnement beta-5, Sigrist KTNR-M-R21 and Sick RM 100. Each monitor proved to have a correlation coefficient larger than 97%. As the monitors reacted in exactly the same way it was concluded that they are all suitable for continuous measurement of dust concentrations of 3-15 mg per cubic meter (n,t). (AB).

19431 (NEI-DK–828) **Dioxin emission from vehicles.** Soegaard, N.; Grove, A. Dansk Teknologisk Inst., Taastrup (Denmark). Auto- og Motorteknik; Dansk Teknologisk Inst., Taastrup (Denmark). Miljoeteknik. Jan 1992 58p. (In Danish). Contract EM-1243/88-6. Order Number DE92506394. Source: OSTI; NTIS (US Sales Only). EFP-88.

The theoretical aspects of toxic emission from cars presented here are based on a perusal of relevant literature published in countries other than Denmark. Following this, results are given of an analysis of a vehicle's performance with regard to emission and dioxins, in the case of dioxins in relation to lead content and the amount of additives in the petrol used. Results show that the emission of dioxin does depend on the amount of additives in the petrol, yet it has not been possible to detect it in cases of normal additive content, but only in the case of provoked excess use of additives. It could not be proved that the use of a catalytic converter had any significant effect on the dioxin emission. International investigations show that diesel motors do not produce dioxin, and also that motors that utilize unleaded petrol only emit very small amounts of dioxin in comparison to those that use leaded petrol. The dioxin emission from the total Danish private-car fleet is claimed to be less than 400 g per year. (AB).

19432 (NEI-NO–198) **Radon in dwellings: Recommendations for measurements indoors and for investigations on building site.** SIS Raad. Statens Inst. for Straalehygiene, Oslo (Norway). 1991 19p. (In Norwegian). Order Number DE92627917. Source: OSTI; NTIS (US Sales Only); INIS.

An evaluation of methods for the radiation monitoring of radon in indoor air is given, together with guidelines for the investigation of building sites taking in consideration the radiation hazards from radon. 2 figs., 4 tabs.

19433 (NEI-NO–211) **Economics and the global environmental challenge.** Pearce, D. Fridtjof Nansens Inst., Lysaker (Norway). 1990 24p. Order Number DE92506548. Source: OSTI; NTIS (US Sales Only).

The problems of designing international agreements to meet the global environmental challenge are formidable. This paper has offered only the briefest of overviews of what is a major set of issues for immediate and future debate. The basic questions posed are highly problematic, namely what is an acceptable level and rate of global warming, and how we design an efficient structure of global incentives for cooperation. The answers will involve more imagination and vigor than the international community has shown so far. It is evident that many of the existing discussions are based on the belief that science alone can determine what is acceptable. That is false, and most probably dangerous in terms of the potential for wasting the resources of the world. Social scientists are also relevant to measuring impacts and computing the cost of global warming. But assessing impacts is only one aspect of the decision-making problem. Designing incentives is the remaining one. Humans are all too rational in their self-interest and it is this that will threaten international agreements, unless, of course, we use and manipulate self-interest to global advantage. That is the real global challenge. 36 refs., 4 tabs.

19434 (NUREG–0837-Vol.11-No.4) **NRC TLD Direct Radiation Monitoring Network: Quarterly progress report, October–December 1991.** Struckmeyer, R.; McNamara, N. Nuclear Regulatory Commission, King of Prussia, PA (United States).

Region I. Apr 1992. 319p. Sponsored by Nuclear Regulatory Commission, Washington, DC (United States). Source: OSTI; NTIS; GPO.

This report presents the results of the Nuclear Regulatory Commission (NRC) Direct Radiation Monitoring Network for the fourth quarter of 1991. It provides the ambient radiation levels measured in the vicinity of 75 sites throughout the United States. In addition, it describes the equipment used, monitoring station selection criteria, characterization of the dosimeter response, calibration procedures, statistical methods, intercomparison, and quality assurance program.

19435 (NUTEK-FBT–92-6) **Characterization of flue gases from wood fired boilers.** Karlsson, M.L. (Swedish National Testing and Research Institute, Boraas (Sweden)); Gustavsson, L. NUTEK - Swedish National Board for Industrial and Technical Development, Stockholm (Sweden). [1992]. 73p. (In Swedish). Project NUTEK-276-464. Order Number DE92506589. Source: OSTI; NTIS (US Sales Only).

The measurements were made on four small house boilers. Three of them were environmentally approved with improved combustion technology, while the fourth was a traditional boiler. Investigated parameters were: * CO, CO_2, NO_x and CH_x, * tar and dusts, * 12 volatile organic compounds (VOC), * polycyclic aromatic hydrocarbons, * chlorobenzenes and chlorophenols, * dioxins. Tar content fell below current limit value, 30 mg/MJ, in the approved boilers. The traditional boiler release was 30 times higher than those from the approved ones. Emission of NO_x was 60-76 mg/MJ for the traditional and 100-140 mg/MJ for the approved. Regarding VOC, the traditional boiler release was 2-4 times higher when ackumulator firing, but with direct firing there was no difference. (Numerous figs. and tabs.).

19436 (ORNL/CDIAC–46) **TRENDS 1991: A compendium of data on global change.** Boden, T.A.; Sepanski, R.J.; Stoss, F.W. (eds.). Oak Ridge National Lab., TN (United States). Carbon Dioxide Information Analysis Center. Dec 1991. 694p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. (ESD–3746). Order Number DE92011733. Source: OSTI; NTIS; INIS; GPO Dep.

Environmental Sciences Division Publication No. 3746.

This document is a source of frequently used global-change data. This second issue of the Trends series expands the coverage of sites recording atmospheric concentrations of carbon dioxide (CO_2) and methane (CH_4), and it updates records reported in the first issue. New data for other trace atmospheric gases have been included in this issue; historical data on nitrous oxide (N_2) from ice cores, modern records of atmospheric concentrations of chlorofluorocarbons (CFC-11 and CFC-12) and N_2O, and estimates of global estimates of CFC-11 and CFC-12. The estimates for global and national CO_2 emissions from the burning of fossil fuels, the production of cement, and gas flaring have been revised and updated. Regional CO_2 emission estimates have been added, and long-term temperature records have been updated and expanded. Data records are presented in four- to six-page formats, each dealing with a specific site, region, or emissions species. The data records include tables and graphs; discussion of methods for collecting, measuring, and reporting the data; trends in the data; and references to literature that provides further information. All data appearing in the document are available on digital media from the Carbon Dioxide Information Analysis Center.

19437 (ORNL/CDIAC–47) **Two long-term instrumental climatic data bases of the People's Republic of China.** Kaiser, D.P. Oak Ridge National Lab., TN (United States). Carbon Dioxide Information Analysis Center. Nov 1991. 188p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. (NDP–039). Order Number DE92010378. Source: OSTI; NTIS; GPO Dep.

Environmental Sciences Division Publication No. 3747.

Two long-term instrumental data bases containing meteorological observations from the People's Republic of China (PRC) are described. These data sets were compiled in accordance with a joint research agreement signed by the United States Department of Energy (DOE) and the PRC Chinese Academy of Sciences (CAS) on August 19, 1987. CAS has provided records from 265 stations, partitioned into networks of 60 and 205 stations which each provide good geographical coverage of the PRC. The 60-station network data contain monthly measurements of barometric pressure, air temperature, precipitation amount, relative humidity, sunshine duration, cloud amount, wind direction and speed, and number of days with snow cover. Detailed station histories are presented for all 60 stations. The 205-station network data contain monthly mean temperatures and monthly precipitation totals; however, station histories are not currently available. Sixteen stations from these data sets (13 from the 60-station, 3 from the 205-station) have temperature and/or precipitation records which begin prior to 1900, whereas the remaining stations began observing in the early to mid 1900s. Records from the 262 stations extend through 1988; the remaining three station records extend through the early 1980s. These data can be used in defining regional climate changes, establishing relationships between regional and large-scale climates, and in studying the climatic impacts of urbanization and increased concentrations of greenhouse gases. Additional uses could include examining impacts of periodic events such as volcanic eruptions or the El Nino/Southern Oscillation (ENSO). These data sets represent the most comprehensive, long-term instrumental Chinese climate data presently available.

19438 (PNL–8049) **1988 Wet deposition temporal and spatial patterns in North America.** Simpson, J.C.; Olsen, A.R.; Bittner, E.A. Pacific Northwest Lab., Richland, WA (United States). Mar 1992. 198p. Sponsored by USDOE, Washington, DC (United States); Environmental Protection Agency, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE92011509. Source: OSTI; NTIS; GPO Dep.

The focus of this report is on North American wet deposition temporal patterns from 1979 to 1988 and spatial patterns for 1988. It is the third in a series of reports that investigate the patterns of annual precipitation-weighted average concentration and annual deposition for nine ion species: hydrogen, sulfate, nitrate, ammonium, calcium, chloride, sodium, potassium, and magnesium. Mosaic maps, based on surface estimation using kriging, display concentration and deposition spatial patterns of pH, hydrogen, sulfate, nitrate, ammonium, and calcium ion species for 1988 annual, winter, and summer periods. Temporal pattern analyses use a subset of 35 sites over a 10-year (1979–1988) period and an expanded subset of 137 sites, with greater spatial coverage, over a 7-year (1982–1988) period. The 10-year period represents the longest period with wet deposition monitoring data available that has a sufficient number of sites with data of known quality to allow a descriptive summary of annual temporal patterns. Sen's median trend estimate and Kendall's seasonal tau (KST) test are calculated for each ion species concentration and deposition at each site in both subsets.

19439 (PNL-SA–20399) **Reducing greenhouse gas emissions in Czechoslovakia.** Kostalova, M. (Office of International Economic Corp., Ministry of Foreign Affairs, Prague (Czechoslovakia)); Suk, J.; Kolar, S. Pacific Northwest Lab., Richland, WA (United States). Dec 1991. 23p. Sponsored by Environmental Protection Agency, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE92012354. Source: OSTI; NTIS; INIS; GPO Dep.

In this paper are presented important findings on the potential for energy conservation and carbon emissions reduction over the coming decades in Czechoslovakia. The authors describe the state of the energy use in Czechoslovakia today and the measures required to transform its energy system to a market-based economy oriented towards the environmental goal of decreased energy intensity. This work furthers our understanding of the need for energy efficiency in the newly forming market economies of East and Central Europe. This paper is part of a series of country studies sponsored by the Global Climate Division of the Office of Policy, Planning, and Evaluation, United States Environmental Protection Agency (EPA). We have completed similar studies in Canada, the former Soviet Union, France, Hungary, Italy, Japan, Poland the United Kingdom, and the United States. Research is currently underway or planned in Bulgaria, Romania, and Ukraine.

19440 (SCPRI-RM–3-1991) **Monthly results of measurements, march 1991, with supplement related to 1991 first quarter.** Service Central de Protection contre les Rayonnements

Ionisants, 78 - Le Vesinet (France). Mar 1991. 60p. (In French). Order Number DE92517861. Source: OSTI; NTIS (US Sales Only); INIS.

This report of the SCPRI exposes an interpretation of the principal results concerning the routine monitoring of environmental radioactivity in France: atmospheric dusts, rainwater, surface water, underground water, sewage water, drinking water, food chain (milk, vegetables, fishes), sea water around nuclear plant sites and other sites. The activities of various radioisotopes are presented in tables.

19441 (SCPRI-RM-9-1991) **Monthly results of measurements, september 1991, with supplement related to 1991 third quarter.** Service Central de Protection contre les Rayonnements Ionisants, 78 - Le Vesinet (France). 1991. 55p. (In French). Order Number DE92517862. Source: OSTI; NTIS (US Sales Only); INIS.

This report of the SCPRI exposes an interpretation of the principal results concerning the routine monitoring of environmental radioactivity in France: atmospheric dusts, rainwater, surface water, underground water, sewage water, drinking water, food chain (milk, vegetables, fishes), sea water around nuclear plant sites and other sites. The activities of various radioisotopes are presented in tables.

19442 (SFB-210/T-67) **On the parameterization of an admixture exchange between the planetary boundary layer and the free atmosphere.** Zilitinkevich, S.S. (Academy of Sciences, Leningrad (USSR). Inst. of Limnology). Karlsruhe Univ. (T.H.) (Germany). Sonderforschungsbereich 210 Stroemungsmechanische Bemessungsgrundlagen fuer Bauwerke. Aug 1990. 7p. Order Number DE92515868. Source: OSTI; NTIS (US Sales Only).

The problem of an admixture exchange between the planetary boundary layer (PBL) and the free atmosphere (FA) is considered, accounting for the blocking effect of the stably stratified intermediate layer, the 'atmospheric thermocline' (AT), in frames of a model based on the budget equations for the vertically averaged admixture concentrations. The most simple parameterization of the admixture fluxes through the PBL/AT and AT/FA interfaces produced by the low frequency mesoscale motions is suggested. (orig.).

19443 (UCRL-52000-91-12) **Energy and technology review, December 1991.** Sefcik, J.A.; de Vore, L.; Gleason, K.; Kroopnick, H.; McGregor, C.; Stanford, N.M. (eds.). Lawrence Livermore National Lab., CA (United States). [1991]. 34p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. Order Number DE92013595. Source: OSTI; NTIS; GPO Dep.

The Lawrence Livermore National Laboratory was established in 1952 to do research on nuclear weapons and magnetic fusion energy. Since then, we have added other major programs, including laser fusion and laser isotope separation, biomedical and environmental science, strategic defense, and applied energy technology. These programs, in turn, require research in basic scientific disciplines, including chemistry and materials science, computer science and technology, engineering, and physics. Energy and Technology Review is published monthly to report on unclassified work in all our programs. Various topics concerning Desert Storm are presented in this issue: (1) The Oil/Gas Separator: A New Cap for Quenching Oil-Well Fires; (2) Airborne Detection of Buried Minefields; (3) Assessing the Hazardous Effects of Airborne Particles During and After Operation Desert Storm.

19444 (UCRL-JC-109830) **Daily dispersion model calculations of the Kuwait oil fire smoke plume.** Ellis, J.S. (Lawrence Livermore National Lab., CA (United States)); Foster, C.S.; Foster, K.T.; Sullivan, T.J.; Baskett, R.L.; Nasstrom, J.S.; Schalk, W.W. III; Greenly, G.D. Lawrence Livermore National Lab., CA (United States). 26 Mar 1992. 14p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48 ;AC08-88NV10617. (CONF-9206114-7: Annual meeting of the Air and Waste Management Association (AWMA), Kansas City, MO (United States), 21-26 Jun 1992; EGG-10617-4129). Order Number DE92011969. Source: OSTI; NTIS; GPO Dep.

The Atmospheric Release Advisory Capability (ARAC) provided daily forecasts of the position and spatial character of the Kuwait oil fire smoke plume to the NSF-coordinated research aircraft missions in the Persian Gulf. ARAC also provided daily plume dispersion products to various nations in the Persian Gulf region under the auspices of the World Meteorological Organization for a period of nearly 5 months. Forecasted three dimensional winds were provided to ARAC from the US Air Force Global Weather Central's Relocatable Wind Model (RWM). The RWM winds were spaced approximately 90 km in the horizontal and were located at the surface, 1000 ft., 2000 ft, 5000 ft and every 5000 ft up to 30,000 ft elevation. The forecast periods were 0, 6, 24, and 36 hours from both 0000 and 1200 UTC. A wind field model (MATHEW) corrected for terrain influences on the wind. The smoke plume was dispersed using a three dimensional particle-in-cell code (ADPIC) with buoyant plume rise capability. Multiple source locations were used to represent the burning oil fields. Improved estimates of the source term and emission factors for the smoke were incorporated into the ADPIC calculations as the field measurement data were made available.

19445 (UCRL-LR-105199-91) **Environmental Technology Program: Annual report, FY91.** Lawrence Livermore National Lab., CA (United States). 2 Jan 1992. 99p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. Order Number DE92012613. Source: OSTI; NTIS; GPO Dep.

Lawrence Livermore National Laboratory's Environmental Technology Program was organized in FY90 to research, develop, demonstrate, test, and evaluate innovative technologies for reducing the costs and increasing the effectiveness of environmental restoration and waste management. During FY91 the program was funded primarily by the Office of Technology Development of the US Department of Energy's Office of Environmental Management. The program works closely with environmental restoration and waste management projects funded by DOE's Office of Environmental Restoration and Office of Waste Operations. This report introduces the scope, participating organizations, and interfaces of the Environmental Technology Program, and gives an overview of technical progress in FY91.

19446 (VTT-TIED-1244) **Emission measurement in energy production: High-powered sampling apparatus for organic compounds.** Tirkkonen, T. (Technical Research Centre of Finland, Espoo (Finland). Chemical Lab.); Laukkarinen, A.; Hoffren, H.; Mroueh, U.M. Technical Research Centre of Finland, Espoo (Finland). May 1991. 40p. (In Finnish). Order Number DE92506497. Source: OSTI; NTIS (US Sales Only).

The project is financed by the Finnish Ministry of Trade and Industry.

The Chemical Laboratory of Technical Research Centre of Finland has developed and built a fast high-powered sampling apparatus for organic compounds from flue gases.

19447 (VTT-TIED-1309) **Reduction of heavy metal emissions: Technical-economic study.** Aunela, L. (Technical Research Centre of Finland, Espoo (Finland). Lab. of Heating and Ventilation); Larjava, K. Technical Research Centre of Finland, Espoo (Finland). Nov 1991. 79p. (In Finnish). Order Number DE92506500. Source: OSTI; NTIS (US Sales Only).

Heavy metal concentrations in tne flue gases of metal and building material industries and energy production exceeds the German emission standards unless efficient cleaning devices are installed. Particle separators are mainly used to achieve reductions in heavy metal emissions. Some of the heavy metals, most of the mercury and a variable but generally small proportion of other metals, occur in flue gases as vapours, which have to be separated by special methods. The most effectively performing particle separators, i.e. bag and electrical filters, are suitable for the removal of heavy metals, since the metals are concentrated in the treatment equipment into particles that are most difficult to remove. Vapourous metals are removed by adsorbing them on a solid material or by absorbing them into a liquid. The end-product of the adsorption process is a solid, whereas the end-product of the absorption process is a liquid, unless the water is vaporized. Generally, heavy metals are removed from flue gases primarily by reducing emissions (usually particles) of some other emission component. The costs associated with reduced heavy metal emissions have been examined using example cases. Because treatment measures are not generally targeted directly at heavy metals, the costs associated with these are difficult to assess. The acquisition costs of bag filters, which are almost always able to reduce the overall concentration of the most harmful heavy metals in particulate phase to well below 1 mg/m^3, are FIM 50- 100m^3/h. The acquisition costs of electrical filters, which are generally able to reduce the concentration of the heavy metals to 1 mg/m^3 or below, vary between FIM 30 000-80 000/MW, depending on the capacity of the energy production plant.

19448 (VTT-TIED–1313) **Emission model of energy production and industry for Finland.** Lehtilae, A. (Technical Research Centre of Finland, Espoo (Finland). Nuclear Engineering Lab.); Pirilae, P. Technical Research Centre of Finland, Espoo (Finland). Dec 1991. 95p. (In Finnish). Order Number DE92506489. Source: OSTI; NTIS (US Sales Only).

Energy conversion and energy use are important sources of atmospheric pollution. EFOM-ENV is a modelling tool which can be used to describe the whole energy system, the emissions produced in it, and the available emission control measures. In the past few years EFOM-ENV models have been taken into widespread use all over Europe, and the models have proven to give a good basis for international cooperation in emission control analysis. An FFOM-ENV model is a dynamic linear optimization model. It can be used to analyse the cost-effectiveness of fuel switching, technological substitution, energy conservation, efficiency improvements and emission control technologies in the search for optimal strategies to reduce emissions within one country. All kinds of emissions can simultaneously be taken into consideration in the analysis. Most useful result, however, have been obtained in studies concerning on one hand the acidificating sulphur and nitrogen oxides and on the other hand the greenhouse gases, particularly carbon dioxide. The results from the model applications describe the optimal means to reach given emission targets in terms of developments in the energy system as well as direct control measures.

19449 **Means for separating out noxious substances from gases and exhaust gases, a process of making said means and a process.** Suchenwirth, H. 2 Nov 1991. Filed date 2 May 1990. Canada Patent patent application 2015974. 17p. Source: Micromedia Ltd., Technical Information Centre, 165 Hotel de Ville, Place du Portage, Phase 2, Hull, Quebec, Canada J8X 3X2. Prices: PC $6.00 CAN; MF $4.00 CAN.

A method for removing noxious substances from gases is provided which is suited for treating gases and exhaust gases from industrial plants, power plants, refuse incinerating plants, and combustion plants. In the first stage of the method, calcium hydroxides are produced which contain water-soluble salts of sulfur compounds such as mercaptans, sulfides, polysulfides, polythionates, and thiosulfates or elementary sulfur which is used in combination with surface active substances. The second stage consists of reacting the resulting pollutant removal product with volatile pollutants such as heavy metals contained in the gas being treated. The contaminants are then separated out of the gas stream. The pollutant removal product can be produced by adding the sulfur compounds to calcium oxide during slaking, to the slaking water, or to calcium hydroxide subsequent to slaking. The pollutant removal product is particularly useful for removing metals including Hg, As, Cd, Tl, Sb, and Pb at temperatures ranging from 20 to 400°C. For this purpose, the product is blown as powder into the gas stream, and the resultant substances are separated by means of fabric filters. Upon addition of surface active substances, volatile organic pollutants are removed simultaneously with the inorganic pollutants. Experiments are described to illustrate the invention.

19450 (AECL–8905) **A downhole colun technique for field measurememnt of transport parameters.** Champ, D.R.; Moltyaner, G.L.; Young, J.L.; Lapcevic, P. Atomic Energy of Canada Ltd., Chalk River, ON (Canada). Chalk River Nuclear Labs. Oct 1985. 48p. Order Number DE92625794. Source: OSTI; NTIS (US Sales Only); INIS.

The paper presents a new method for the characterization of dispersive and adsorptive properties of natural sedimentary deposits at a field site in the Perch Lake Basin using a downhole technique. The potential capabilities of the proposed method were evaluated by conducting a dual-tracer test in a series of downhole field columns using non-reactive (^{3}H) and reactive (^{85}Sr) tracers. The observed breakthrough curves were analysed using linear and non-linear mass transport equations. The dispersivity values obtained by analysing ^{3}H (range 0.2-1.1 cm) are in good agreement with those reported for ^{131}I radial injection experiment at the same site (range 0.4-1.5 cm). The distribution coefficient (Kd^{Sr}) values obtained from analysis of breakthrough curves at four depths using the linear equilibrium model ranged from 6.22 to 7.39 mL.g^{-1}. These values are in good agreement with those obtained by separation of pore waters from sediments (5.0-6.6 mL.g^{-1}) and half of those obtained by batch experiments on core sediments (12.8-14.9 mL.g^{-1}). These values compare favorably with the Kd^{Sr} determined for Sr migrating in a 25-year-old radioactive waste plume (mean of 10 mL.g^{-1}) at a nearby site. The model identification problem was addressed by constructing linear and non-linear equilibrium transport models. The non-linear models based upon Freundlich and Langmuir isotherms showed some improvement over the linear model in fitting experimental data. It was concluded, however, that for simulating radio-strontium behaviour.

19451 (AECL–10370) **Fracture detection and groundwater flow characterization in poorly exposed ground using helium and radon in soil gases.** Gascoyne, M.; Wuschke, D.M. Atomic Energy of Canada Ltd., Pinawa, MB (Canada). Whiteshell Nuclear Research Establishment. May 1991. 80p. Order Number DE92625809. Source: OSTI; NTIS (US Sales Only); INIS.

Radon and helium in soil gases have been used to identify locations of groundwater discharge and the presence of fractures outcropping beneath overburden in two areas near the Underground Research Laboratory (URL), Lac du Bonnet, Manitoba, Canada. In particular, groundwater discharge from a known, inclined fracture zone at the URL was clearly identified by a helium excess in overlying soil gases. A model was developed to describe gas phase flow in bedrock and overburden at this location, from gas injection in an adjacent borehole. Predictions were made of gas transport pathway and breakthrough time at the surface, in preparation for a gas injection test.

19452 (AECL–10384) **The mass transport of radionuclides in a multilayered medium.** Garisto, N.C.; LeNeveu, D.M.; Garisto, F. Atomic Energy of Canada Ltd., Pinawa, MB (Canada). Whiteshell Nuclear Research Establishment; Ontario Hydro, Toronto, ON (Canada). Jan 1992. 40p. (COG–91-297.). Order Number DE92625793. Source: OSTI; NTIS (US Sales Only); INIS.

This document describes the mathematical formalism for calculating the rate of mass transport across interfaces in a multilayered medium for radionuclides in a decay chain. Two numerical algorithms have been developed, both based on Laplace transport techniques: a direct solution for concentrations and fluxes in a two-layer medium; and, an approximate solution based on a response function for the mass transport across a finite layer adjacent to a semi-infinite layer. A comparison of the two algorithms is presented. Results of sample calculations for a multilayered medium are also reported and compared with results based on the mass-transfer coefficient approximation.

19453 (ANL–91/3) **Argonne National Laboratory–East site environmental report for calendar year 1990.** Golchert, N.W.; Duffy, T.L.; Moos, L.P. Argonne National Lab., IL (United States). Jul 1991. 212p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38. Order Number DE92012282. Source: OSTI; NTIS; INIS; GPO Dep.

This report discusses the results of the environmental protection program at Argonne National Laboratory-East (ANL) for 1990. To evaluate the effects of ANL operations on the environment, samples of environmental media collected on the site, at the site boundary, and off the ANL site were analyzed and compared to applicable guidelines and standards. A variety of radionuclides was measured in air, surface water, groundwater, soil, grass, bottom sediment, and milk samples. In addition, chemical constituents in surface water, groundwater, and ANL effluent water were analyzed. External penetrating radiation doses were measured and the potential for radiation exposure to off-site population groups was estimated. The results of the surveillance program are interpreted in terms of the origin of the radioactive and chemical substances (natural, fallout, ANL, and other) and are compared with applicable environmental quality standards. A US Department of Energy (DOE) dose calculation methodology, based on International Commission on Radiological Protection (ICRP) recommendations, is used in this report. The status of ANL environmental protection activities with respect to the various laws and regulations which govern waste handling and disposal is discussed. This report also discusses progress being made on environmental corrective actions and restoration projects from past activities.

19454 (ANL/CP-75281) **Application of ground-penetrating radar at McMurdo Station, Antarctica.** Stefano, J.E. Argonne National Lab., IL (United States). [1992]. 17p. Sponsored by National Science Foundation, Washington, DC (United States). DOE Contract W-31109-ENG-38. (CONF-9204110-1: 1992 Hazardous Materials Control Research Institute federal environmental restoration conference, Vienna, VA (United States), 15-17 Apr 1992). Order Number DE92010902. Source: OSTI; NTIS; INIS; GPO Dep.

Argonne National Laboratory initiated a site investigation program at McMurdo Station, Antarctica, to characterize environmental contamination. The performance and usefulness of ground-penetrating radar (GPR) was evaluated under antarctic conditions during the initial site investigation in January 1991. Preliminary surveys were successful in defining the contact between reworked pyroclastic material and in the prefill, undisturbed pyroclastics and basalts at some sites. Interference from radio traffic at McMurdo Station was not observed, but interference was a problem in work with unshielded antennas near buildings. In general, the results of this field test suggest that high-quality, high-resolution, continuous subsurface profiles can be produced with GPR over most of McMurdo Station.

19455 (ANL/CP-75814) **Effects of solution pH and complexing reagents on the desorption of radionuclides in soil.** Wang, Yug-Yea; Yu, C. Argonne National Lab., IL (United States). [1992]. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38. (CONF-9205148-1: Mid-America Chinese professional annual convention, Itasca, IL (United States), 29-31 May 1992). Order Number DE92013062. Source: OSTI; NTIS; GPO Dep.

In contaminated soils, radionuclides such as uranium and/or thorium may be associated with different chemical species on soil surfaces or inside soil grains with consequent differences in leachability and mobility. Chemical species in contacting solutions can react with soil contaminants by dissolution, ion exchange, or complexation to release contaminants from the soil to the solution. It is important to understand the effect of chemical species in solution for investigating the distribution of uranium and thorium between the soil and the solution under desorption conditions. In this work, the effects of the solution pH and the complexing reagents on the desorption of uranium and thorium under saturated equilibrium conditions were investigated.

19456 (ANL/ESD/TM-26) **Documentation of the Range 8C rehabilitation demonstration project at Hohenfels Training Area, West Germany.** Zellmer, S.D.; Hinchman, R.R.; Carter, R.P.; Severinghaus, W.D.; Lacey, R.M.; Brent, J.J. Argonne National Lab., IL (United States). Energy Systems Div. Mar 1987. 105p. Sponsored by Department of Defense, Washington, DC (United States). DOE Contract W-31109-ENG-38. Order Number DE92013298. Source: OSTI; NTIS; GPO Dep.

Continued and intensive tactical training for the last 35 years at the Hohenfels Training Area (HTA), Federal Republic of Germany, has resulted in extensive environmental damage and reduced training realism. The US Corps of Engineers Construction Engineering Research Laboratory is developing an Integrated Training Area Management (ITAM) Program for the Seventh Army Training Command for use at HTA. Argonne National Laboratory was asked to assist in one element of the ITAM program, a training range rehabilitation demonstration project. The rehabilitation project was begun in 1986 on a 62-ha watershed that included about 16 ha of meadow with training damage typical of HTA. On the basis of amount of plant ground cover, type and degree of erosion, and soil properties, 10 rehabilitation prescriptions were developed to reestablish plant cover, control erosion, and improve training realism. Prescriptions were installed by a local contractor in September 1986. A monitoring program is under way to determine the effectiveness of this effort. Results and experience gained from this project will be used in the ITAM program and for rehabilitation training courses conducted at HTA.

19457 (ANL/RP-75855) **Derivation of uranium residual radioactive material guidelines for the Ventron site.** Loureiro, C.; Yu, C.; Jones, L. Argonne National Lab., IL (United States). Mar 1992. 18p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38. Order Number DE92012684. Source: OSTI; NTIS; INIS; GPO Dep.

Residual radioactive material guidelines for uranium were derived for the Ventron site in Beverly, Massachusetts. This site has been identified for remedial action under the Formerly Utilized Sites Remedial Action Program of the US Department of Energy (DOE). The derivations for the single radionuclides and the total uranium guidelines were based on the requirement that the 50-year committed effective dose equivalent to a hypothetical individual who lives or works in the immediate vicinity of the Ventron site should not exceed a dose of 100 mrem/yr following remedial action. The DOE residual radioactive material guideline computer code, RESRAD, which implements the methodology described in the DOE manual for implementing residual radioactive material guidelines, was used in this evaluation.

19458 (BfS-ISH-155/91) **Investigations into the transfer of cesium 137 and strontium 90 in selected exposure pathways. Final report.** Roemmelt, R.; Hiersche, L.; Wirth, E. Bundesamt fuer Strahlenschutz, Neuherberg (Germany). Inst. fuer Strahlenhygiene; Bundesministerium fuer Umwelt, Naturschutz und Reaktorsicherheit, Bonn (Germany). Dec 1991. 91p. (In German). Contract BMU St.Sch 1033. Order Number DE92517151. Source: OSTI; NTIS (US Sales Only); INIS.

This research project investigates the behaviour of radiocesium and strontium 90 in natural conifer forest sites and derives corresponding transfer factors for radioecological calculations. As a point of particular interest the question was investigated in how far the requirements of the different mushroom species and the properties of the forest soil bear on the dynamics and transfer rate of radiocesium and strontium 90. To complement the investigations, autotrophic plants were included. The results of these studies are compared with the behaviour of the same radionuclides on farmland. The differences are discussed. (orig./HP).

19459 (CONF-9103215-, pp. 64-69) **Wood ash disposal and utilization.** Campbell, A.G. (Univ. of Idaho, Moscow (United States)). USDOE Bonneville Power Administration, Portland, OR (United States). PNW and Alaska Bioenergy Program; Idaho Univ., Moscow, ID (United States). Dept. of Forest Products; Idaho Dept. of Water Resources, Boise, ID (United States). [1991]. From Small-scale bioenergy alternatives for industry, farm, and institutions: a user's perspective; Coeur d'Alene, ID (United States); 18-21 Mar 1991. In *Small-scale bioenergy alternatives for industry, farm, and institutions: A user's perspective.* 219p. Order Number DE92005481. Source: OSTI; NTIS; INIS.

Wood ash is becoming a major disposal problem to the forest products industry as solid waste regulations become more stringent and as landfill costs escalate. The objective of this paper is to present information on wood ash that can be used to evaluate disposal and utilization alternatives. This paper reviews the literature on the chemical and physical properties of ash, methods of disposal and utilization, land application practices, and regulations concerning disposal. Wood ash has been used for centuries as a source of potash and lime for agricultural fields. Based on the properties of wood ash and the disposal alternatives, land application appears to be a safe, relatively simple and economical method for ash disposal. For example, several ash producers in the Northeast and Northwest currently land apply wood ash based on the liming requirements of the soil. Wood ash is a valuable liming agent and soil amendment which should be recycled back to the land rather than being concentrated and buried in a landfill.

19460 (CONF-9109234–Absts.) **Fourth Tennessee water resources symposium: Extended abstracts.** Sale, M.J.; Presley, P.M. (comps.). Oak Ridge National Lab., TN (United States). [1991]. 183p. Sponsored by USDOE, Washington, DC (United States); Department of Defense, Washington, DC (United States); Tennessee Valley Authority, Knoxville, TN (United States); Geological Survey, Reston, VA (United States); Tennessee Technological Univ., Cookeville, DOE Contract AC05-84OR21400. From 4. Tennessee water resources symposium; Knoxville, TN (United States); 24-26 Sep 1991. Order Number DE92011935. Source: OSTI; NTIS; INIS; GPO Dep.

The annual Tennessee Water Resources Symposium was initiated in 1988 as a means to bring together people with common interests in the state's important water-related resources at a technical, professional level. Initially the symposium was sponsored by the American Institute of Hydrology and called the Hydrology Symposium, but the Tennessee Section of the American Water Resources Association (AWRA) has taken on the primary coordination role for the symposium over the last two years and the symposium name was changed in 1990 to water resources to emphasize a more inter-disciplinary theme. This year's symposium carries on the successful tradition of the last three years. Our goal is to promote communication and cooperation among Tennessee's water resources professionals: scientists, engineers, and researchers from federal, state, academic, and private institutions and organizations who have interests and responsibilities for the state's water resources. For these conference proceedings, individual papers are processed separately for the Energy Data Base.

19461 (CONF-920444–24) **Solubilization and biodegradation of hydrophobic organic compounds in soil/aqueous systems with nonionic surfactants.** Edwards, D.A.; Laha, S.; Liu, Zhongbao; Luthy, R.G. Carnegie-Mellon Univ., Pittsburgh, PA (United States). Dept. of Civil Engineering. [1992]. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG22-90PC90303. From American Chemical Society national meeting; San Francisco, CA (United States); 5-10 Apr 1992. Order Number DE92011550. Source: OSTI; NTIS; GPO Dep.

Nonionic surfactants may strongly interact with hydrophobic organic compounds (HOCs), soil, and microorganisms in soil/aqueous systems. These interactions affect the potential for surfactant-facilitated HOC transport in soil and groundwater systems, and the feasibility of engineered surfactant cleanup of contaminated sites (McCarthy and Wober, 1991). At sufficiently high bulk liquid concentrations at 25 C, most nonionic surfactants form regular micelles in single-phase solutions, whereas certain surfactants, such as $C_{12}E_4$, may form bilayer lamellae or other types of aggregates in more complex two-phase solutions. The critical concentrations for the onset of micelle and aggregate formation are termed the critical micelle concentration (CMC) and the critical aggregation concentration (CAC), respectively. Important changes occur in surfactant sorption, surfactant solubilization of HOCs, and microbial mineralization of HOCs in the presence of nonionic surfactants at or near these critical surfactant concentrations.

19462 (CONF-920444–25) **Effects of nonionic surfactants on the microbial mineralization of phenanthrene in soil-water systems: [Quarterly report].** Laha, S.; Luthy, R.G. Carnegie-Mellon Univ., Pittsburgh, PA (United States). Dept. of Civil Engineering. [1992]. 4p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG22-90PC90303. From American Chemical Society national meeting; San Francisco, CA (United States); 5-10 Apr 1992. Order Number DE92011551. Source: OSTI; NTIS; GPO Dep.

The purpose of the work reported in this paper was to determine whether the inhibitory effect on microbial degradation of phenanthrene was specific to the nonionic surfactants used previously, i.e., the alkylethoxylate and alkylphenol ethoxylate surfactants. Thus, a number of nonionic surfactants of varying structures and properties were selected for further investigation. In addition, several tests were performed to verify results from earlier experiments.

19463 (CONF-9205144–1) **Dispersal of radioactivity by wildlife from contaminated sites in a forested landscape.** Garten, C.T. Jr. Oak Ridge National Lab., TN (United States). 27 Mar 1992. 34p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. From Dynamic behavior of radionuclides in forests; Stockholm (Sweden); 18-22 May 1992. Order Number DE92011774. Source: OSTI; NTIS; INIS; GPO Dep.

Oak Ridge National Laboratory (ORNL) is located within the Ridge and Valley physiographic province of eastern Tennessee (USA). This area is characterized by deciduous forests dominated by hardwood and mixed mesophytic tree species. Wildlife populations have access to some radioactively contaminated sites at ORNL, and contaminated animals or animal nests within the Laboratory's boundaries have been found to contain on the order of 10^{-12} to 10^{-6} Ci/g of ^{90}Sr or ^{137}Cs, and trace amounts of other radionuclides (including transuranic elements). Theoretical calculations indicate that nanocurie levels of ^{90}Sr in bone can arise from relatively small amounts (1%) of contaminated browse vegetation in a deer's diet. Measures that have been undertaken at ORNL to curtail the dispersal of radioactivity by animals are briefly reviewed.

19464 (CONF-9206114–6) **Nitrogen deposition to forest ecosystems: Forms, regional inputs, and effects.** Hanson, P.J.; Turner, R.S. Oak Ridge National Lab., TN (United States). [1992]. 16p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. From Annual meeting of the Air and Waste Management Association (AWMA); Kansas City, MO (United States); 21-26 Jun 1992. Order Number DE92011773. Source: OSTI; NTIS; GPO Dep.

The transfer of anthropogenically produced compounds from the atmosphere to vegetation has been identified as a possible causal factor leading to changes in natural ecosystems. This "nitrogen loading" is the combined result of the wet deposition of nitrate and ammonium ions in precipitation together with the dry deposition of N-containing particles and gaseous nitrogen compounds. This paper identifies the types and characteristics of reactive nitrogen compounds likely to be deposited to forest ecosystems, summarizes total nitrogen deposition to selected locations in North America and Europe, and discusses the potential direct and indirect effects that nitrogen deposition might be having on terrestrial ecosystems. In addition, the current status of the "critical load" concept for nitrogen deposition is addressed.

19465 (DOE/DP–0099T) **Augmented evaluation of soil contamination at the Savannah River Site outside Building 772-1F.** USDOE Assistant Secretary for Defense Programs, Washington, DC (United States). Safety Diagnostic Div. Jul 1991. 55p. Sponsored by USDOE, Washington, DC (United States). Order Number DE92011738. Source: OSTI; NTIS; GPO Dep.

Radioactive contamination of soil adjacent to the outside south wall of Building 772-1F (a laboratory facility) at the Savannah River Site (SRS) was reported to the Department of Energy (DOE) Headquarters on April 24, 1991. The soil was contaminated as a result of leaks in the piping and in the secondary containment trench of the laboratory liquid-waste drainage system inside Building 772-1F. Contamination in storm drains outside the building was also detected. Because of the potential safety implications of the leaks and contamination, the Office of Self-Assessment and Emergency Management (DP-9) formed an Augmented Evaluation Team (AET) for an on-site diagnostic assessment. The AET was composed of staff from Defense Programs (DP-9 and DP-60), DOE Field Office, Savannah River (SR), a specialist from DOE Field Office, Idaho (ID), a consultant provided by the Nuclear Systems Safety Program of the Lawrence Livermore National Laboratory. This report discusses the AET findings.

19466 (DOE/EA–0501) **Evaporation Basin Test Reactor Area, Idaho National Engineering Laboratory: Environmental assessment.** USDOE Idaho Operations Office, Idaho Falls, ID (United States). Dec 1991. 28p. Sponsored by USDOE, Washington, DC (United States). Order Number DE92012192. Source: OSTI; NTIS; INIS; GPO Dep.

The Department of Energy (DOE) has prepared an environmental assessment (EA), DOE/EA-0501, on the construction and operation of the proposed Evaporation Basin at the Test Reactor Area (TRA) at the Idaho National Engineering Laboratory (INEL) near Idaho Falls, Idaho. Based on the analyses in the EA, DOE has determined that the proposed action is not a major Federal action significantly affecting the quality of the human environment, within the meaning of the National Environmental Policy Act (NEPA) of 1969. Therefore, the preparation of an environmental impact statement (EIS) is not required, and the Department is issuing this Finding of No Significant Impact.

19467 (DOE/EA–0545) **Environmental assessment for the building 235 ion accelerator at the Lawrence Livermore National Laboratory.** USDOE Assistant Secretary for Defense Programs, Washington, DC (United States). Dec 1991. 27p. Sponsored by USDOE, Washington, DC (United States). Order Number DE92012190. Source: OSTI; NTIS; INIS; GPO Dep.

This Environmental Assessment (EA) considers the environmental effects of the operation of a commercially manufactured 4.0-MV ion accelerator in Building 235 at Lawrence Livermore National Laboratory (LLNL), Livermore site. Modifications to Building 235 are also addressed. Although impacts outside the facility are discussed most of the potential effects discussed in this EA are health and safety concerns inside the facility because a small, properly-shielded, commercial 4-MV ion accelerator has negligible impact outside the facility. As a result, the discussion of effects focuses on the area immediately adjacent to the accelerator.

19468 (DOE/EA–0547) **Environmental Assessment for install calibration laboratory, Building 12-52B, Pantex Plant, Amarillo, Texas.** USDOE Assistant Secretary for Environment, Safety, and Health, Washington, DC (United States). Oct 1991. 8p. Sponsored by USDOE, Washington, DC (United States). Order Number DE92012188. Source: OSTI; NTIS; GPO Dep.

This Environmental Assessment (EA) has been prepared pursuant to implementing regulations to the National Environmental Policy Act (NEPA), which requires federal agencies to assess the environmental impacts of a proposed action to determine whether that action requires the preparation of an Environmental Impact Statement (EIS) or if a Finding of No Significant Impact (FONSI) can be issued. NEPA requires that an EA provide an interdisciplinary review of the proposed action in order to identify possible preferable alternatives and to identify mitigative measures that will prevent environmental impacts. If it is determined that the proposed action will have unavoidable significant environmental impact, then an EIS shall be prepared. The proposed project is for design and installation of a self-contained Modular Gage Calibration Laboratory in Building 12-52B at Pantex Plant, Amarillo, Texas. The operating contractor of Pantex Plant has been directed by the Sandia Laboratory at Albuquerque to acquire facilities capable of close temperature and humidity control for calibration of gages and tooling in support of production operations for weapons programs.

19469 (DOE/ER/13747–11) **Depositional and diagenetic history of the Edgecliff reefs (Middle Devonian Onondaga Formation of New York and Ontario): Final report.** Wolosz, T.H. State Univ. of New York, Plattsburgh, NY (United States). Center for Earth and Environmental Sciences. [1992]. 11p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG02-87ER13747. Order Number DE92011128. Source: OSTI; NTIS; GPO Dep.

The study of the depositional history of the Edgecliff reefs is complete. Major results include: the identification of the Edgecliff and its reefs as the product of carbonate deposition in a temperate water environment, modes of reef growth, description of the nature of pinnacle reefs, and the basinal dynamics and distribution of pinnacle reefs. A trend was found of increasing number and size of stromatoporoids westwards from the vicinity of Albany, NY (where they are rare and small) to Hagarsville, Ontario, Canada (where they are common and large) due to the assumed solar warming of coastal currents flowing from east to west supports this hypothesis. Further evidence of this warming includes the first appearance of algae (Rothpletzella) in the vicinity of the LeRoy bioherm, LeRoy, NY. Carbon and oxygen isotopic analyses of brachiopods from the Edgecliff further support a cool water model for reef deposition.

19470 (DOE/ER/60247–T1) **Annual dynamics within the active layer: Annual progress report, March 15, 1990–March 14, 1991.** Alaska Univ., Fairbanks, AK (United States). Water Research Center. [1991]. 22p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG06-84ER60247. Order Number DE92013520. Source: OSTI; NTIS; INIS; GPO Dep.

We have continued our meteorological and hydrologic data collection in support of our process-oriented research. The six years of data collected to date is unique in its scope and continuity in a North Hemisphere Arctic setting. This valuable data base has allowed us to further our understanding of the interconnections and interactions between the atmosphere/hydrosphere/biosphere/lithosphere. The increased understanding of the heat and mass transfer processes has allowed us to increase our model-oriented research efforts. Examples of applications are the following. (1) Spring snowmelt on the North Slope of Alaska is the dominant hydrologic event of the year. This event provides most of the moisture for use by vegetation in the spring and early summer period. The mechanisms and timing of snowmelt are important factors in predicting runoff, the migrations of birds and large mammals and the diversity of plant communities. It is important globally due to the radical and abrupt change in the surface energy balance over vast areas. (2) We were able to explore the trends and differences in the snowmelt process along a transect from the Brooks Range to the Arctic Coastal plain. Snowpack ablation was monitored at three sites. These data were analyzed along with meteorologic data at each site. The initiation of ablation was site specific being largely controlled by the complementary addition of energy from radiation and sensible heat flux.

19471 (DOE/ID–12123) **Managing soil moisture on waste burial sites.** Anderson, J.E. (Idaho State Univ., Pocatello, ID (United States). Dept. of Biological Sciences); Ratzlaff, T.D.; Nowak, R.S.; Markham, O.D. USDOE Idaho Field Office, Idaho Falls, ID (United States). Nov 1991. 22p. Sponsored by USDOE, Washington, DC (United States). Order Number DE92012364. Source: OSTI; NTIS; INIS; GPO Dep.

Shallow land burial is a common method of disposing of industrial, municipal, and low-level radioactive waste. The exclusion of water from buried wastes is a primary objective in designing and managing waste disposal sites. If wastes are not adequately isolated, water from precipitation may move through the landfill cover and into the wastes. The presence of water in the waste zone may promote the growth of plant roots to that depth and result in the transport of toxic materials to above-ground foliage. Furthermore, percolation of water through the waste zone may transport contaminants into ground water. This report presents results from a field study designed to assess the the potential for using vegetation to deplete soil moisture and prevent water from reaching buried wastes at the Idaho National Engineering Laboratory (INEL). Our results show that this approach may provide an economical means of limiting the intrusion of water on waste sites.

19472 (DOE/NV/10845–9) **A deuterium-calibrated, discrete-state compartment model of regional groundwater flow, Nevada Test Site and vicinity.** Sadler, W.R. (Nevada Univ., Reno, NV (United States). Water Resources Center); Campana, M.E.; Jacobson, R.L.; Ingraham, N.L. Nevada Univ., Reno, NV (United States). Water Resources Center. Mar 1992. 77p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC08-90NV10845. Order Number DE92012690. Source: OSTI; NTIS; GPO Dep.

A discrete-state compartment (DSC) model was developed, using the conservative tracer deuterium, to simulate the regional groundwater flow for a portion of southern Nevada, including the Nevada Test Site. The model simulates flow rates, discharge rates, and flow directions, as well as mean ages of the groundwater. The results obtained by this model were found to be similar to those of other studies and available hydrogeologic information. The deep regional groundwater was observed to consistently be more depleted in deuterium than the local vertical recharge waters. However, the deep system is consistently more enriched in deuterium than the underflow water from higher latitudes, which was used as input for the model. The total groundwater flow through the modeled area was estimated to be 58.9×10^6 m^3/yr. Approximately 40 percent of this ground water originates as underflow from the higher latitudes, while the remaining 60 percent is from local vertical recharge. The Spring Mountains and the Fortymile Canyon/Wash–Stockade Wash area were determined to be sources of major vertical recharge with 9.6 x 10^6 m^3/yr, and 7.6 x 10^6 m^3/yr of recharge, respectively. The simulated ages of the groundwater were found to vary considerably, however, the ages do not correlate with position along the simulated flow path. The mean and median ages of the groundwater at Fortymile Canyon/Wash were simulated to be 6,700 and 1,400 years, respectively, while the ages of the groundwater at Yucca Flat were 26,300 and 21,600 years, respectively.

19473 (DOE/PC/90303–T1) **The potential for solubilizing agents to enhance the remediation of hydrophobic organic solutes in soil-water suspensions: [Quarterly report].** Laha, S.; Liu, Z.; Edwards, D.; Luthy, R.G. Carnegie-Mellon Univ., Pittsburgh, PA (United States). Dept. of Civil Engineering. Feb 1991. 16p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG22-90PC90303. Order Number DE92011416. Source: OSTI; NTIS; GPO Dep.

This paper discusses the feasibility for use of surfactant solubilizing agents to enhance the solubility and the rate of microbial degradation of hydrophobic organic solutes in soil-water suspensions. Hydrophobic organic contaminants are strongly sorbed to soil or sediment material, and as a consequence the rate of microbial degradation may depend greatly on the desorption of the sorbed-phase contaminant and the accessibility of the contaminant to soil microorganisms. Chemical solubilizing agents may enhance the rate of hydrophobic organic solute degradation by increasing the rate of solute desorption from soil and the extent of solute partitioning to the aqueous phase. The presentation will review ongoing research on: surfactant solubilization of polycyclic aromatic hydrocarbon (PAH) compounds in clean water, and in soil-water suspensions; and experiments to assess if the addition of surfactant to soil-water suspension results in faster rate of mineralization of PAH compounds in soil.

19474 (DOE/PC/90303–T2) **Rates of solubilization and biodegradation of PAH compounds in porous media: [Quarterly report].** Luthy, R.G. Carnegie-Mellon Univ., Pittsburgh, PA (United States). Dept. of Civil Engineering. Nov 1991. 21p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG22-90PC90303. Order Number DE92011417. Source: OSTI; NTIS; GPO Dep.

Microbial degradation of hydrophobic organic compounds in soils and aquifer media is dependent on rates of desorption of these compounds from solids and rates of solubilization from residual nonaqueous phase liquids (NAPLs). The couples processes involving microbial degradation and hydrophobic compound availability are not well understood. The proposed research effort explores certain physicochemical phenomena that may have a significant affect on the rate of microbial degradation of hydrophobic organic compounds in porous media. The investigation will examine rates of biomineralization of polycyclic aromatic hydrocarbon (PAH) compounds that are leached from a residual saturation of coal tar. Batch and continuously-stirred reactor studies will be used to measure solute equilibrium concentrations and rates of solubilization of PAH compounds from coal tar imbided into microporous silica media. These rates will be compared with rates of mineralization of ^{14}C-labeled compounds in similar systems inoculated with a culture of PAH degrading microorganisms. Column experiments will also be conducted to assess the rates of solubilization and mass transfer coefficients from coal tar entrapped in a sandy aquifer material by capillary forces.

19475 (DOE/RL–92-03) **Annual report for RCRA groundwater monitoring projects at Hanford Site facilities for 1991.** Westinghouse Hanford Co., Richland, WA (United States). Geosciences Group. Feb 1992. 350p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE92012309. Source: OSTI; NTIS; INIS; GPO Dep.

This report describes ground water monitoring activities at the Hanford Reservation. Maps are included of water tables and water chemistry is discussed. (CBS)

19476 (DPST–72-210) **Release of radioactive wash water to ground, Tim's Branch, and seepage basin during cave decontamination.** Waters, D.E. Du Pont de Nemours (E.I.) and Co., Aiken, SC (United States). Savannah River Lab. 26 Jan 1972. 8p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC09-89SR18035. Order Number DE92013213. Source: OSTI; NTIS; GPO Dep.

During decontamination work in the High Level Caves, contaminated wash water leaked from a separator pit beneath the High Level Caves wing (E Wing) of Building 773-A. The waste water leaked through two pathways of radioactivity release. (1) An estimated 1000 gallons of waste water entered an auxiliary pipe trench, leaked from this trench into the ground beneath E Wing, and then seeped from the ground into a storm sewer that drains into Tim's Branch, a stream about 500 ft behind the Technical Area. (2) A larger quantity of waste water (~ 2500 gallons) entered a waste line trench from which most of it was pumped to the high level waste system.

19477 (DPST–76-221) **Preliminary I-129 measurements in the SRP environs.** Hochel, R.C. Du Pont de Nemours (E.I.) and Co., Aiken, SC (United States). Savannah River Lab. 23 Jan 1976. 15p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC09-76SR00001 ;AC09-89SR18035. Order Number DE92013220. Source: OSTI; NTIS; GPO Dep.

Recently a preliminary program at Savannah River Plant was began to measure I-129 concentrations in a variety of environmental samples. The objectives of the study were three-fold: First, to at least qualitatively estimate the impact of Savannah River Plant (SRP) operations on the I-129 inventory in the surrounding area; second, to determine prominent pathways of I-129 to man and to obtain, where possible, estimates of their associated dose rates; and third, to provide necessary input data to help in the design and implementation of more comprehensive follow-up studies.

19478 (DPST–87-820) **Summary of I-129 measurements in ground and surface waters.** Kantelo, M.V. Du Pont de Nemours (E.I.) and Co., Aiken, SC (United States). Savannah River Lab. 17 Nov 1987. 19p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC09-76SR00001 ;AC09-89SR18035. Order Number DE92013190. Source: OSTI; NTIS; GPO Dep.

The iodine-129 content of groundwater and surface water at onplant (Savannah River Plant) and off-plant locations has been determined at irregular intervals since 1970 using neutron activation analysis. I-129 was detected in groundwater near the Burial Ground and near the seepage basins of the Separations areas. For reference, I-129 concentrations in the groundwater can be compared to the EPA drinking water standard. At a few locations the concentrations exceeded both the existing and pending EPA drinking water standard. In surface water, Four Mile Creek was the only SRP stream found to transport significant I-129 to the Savannah River. Dilution by C-Reactor discharge and the Savannah River reduced the off-plant I-129 concentrations in river water to less than 1% of the existing EPA drinking water standard and less than 0.01% of the pending EPA drinking water standard.

19479 (EGG-ESQ–10167) **Monitoring activities review of the Radiological Environmental Surveillance Program.** Ritter, P.D. EG and G Idaho, Inc., Idaho Falls, ID (United States). Mar 1992. 37p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC07-76ID01570. Order Number DE92013103. Source: OSTI; NTIS; INIS; GPO Dep.

The 1992 Monitoring Activities Review (MAR) is directed at the Radiological Environment Surveillance Program (RESP) activities at the Radioactive Waste Management Complex (RWMC) of Idaho Engineering Laboratory (INEL). MAR panelists studied RESP documents and discussed their concerns with Environmental Monitoring Unit (EMU) staff and other panel members. These concerns were subsequently consolidated into a collection of recommendations with supporting discussions. Recommendations focus on specific monitoring activities, as well as the overall program. The MAR report also contains pertinent comments that should not require further action.

19480 (EGG-GEO–9987) **Aquifer test at Comore Loma No. 4, Idaho Falls, Idaho.** Hubbell, J.M. EG and G Idaho, Inc., Idaho

Falls, ID (United States). Dec 1991. 35p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC07-76ID01570. Order Number DE92011699. Source: OSTI; NTIS; GPO Dep.

An aquifer test was conducted at Comore Loma Well #4 to determine the aquifer hydraulic characteristics at this location on July 11 and 12, 1991. Water was withdrawn from Comore Loma Well #4 at approximately 850 gallons per minute for 8 hours while monitoring the water level in the plumping well and an observation well 930 ft away. The pumped well showed over 12 ft of drawdown with no discernable drawdown in the observation well. The drawdown in the pumped well was nearly instantaneous, showing little additional drawdown after 1 minute. The transmissivity was calculated to be approximately 140,000 ft^2/day using the Jacob solution. This gives a hydraulic conductivity of 1300 ft/day for the 110 ft interval tested. The high transmissivity and geologic setting suggest the aquifer may in part produce water from the Snake River Plain aquifer. However, the warm water temperature (71°F) indicates the presence of a geothermal source typical of the foothills aquifer. The storage coefficient could not be calculated since no water level decline was detected in the observation well.

19481 (EGG-GEO-9990) **Aquifer tests near the Idaho Falls Foothills, Idaho.** Hubbell, J.M. EG and G Idaho, Inc., Idaho Falls, ID (United States). 3 Oct 1991. 18p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC07-76ID01570. Order Number DE92012237. Source: OSTI; NTIS; GPO Dep.

Ground water pumping tests were performed in two wells located in the foothills east of Idaho Falls to determine the aquifer characteristics at these locations. These data were used to differentiate this aquifer from the Snake River Plain aquifer. The wells were pumped at rates of 11 and 14 gallons per minute with 0.03 and 0.04 ft of drawdown measured in the pumping wells. The transmissivity is estimated to be 525,000 gpd/ft and 450,000 gpd/ft, respectively. The hydraulic conductivity is 925 ft/day and 1,070 ft/day, respectively. These hydraulic conductivities are similar to those measured in the Snake River Plain aquifer. Water level data in these wells are consistent with the water table in the Snake River Plain aquifer and indicates ground water movement from the foothills toward the Plain. The high transmissivity suggests water may move rapidly from the foothills area to mix with water in the Snake River Plain aquifer. Elevated water temperatures (76 and 70°F) and high specific conductivities in these wells indicate the presence of a foothills aquifer with characteristics that can be used to separate the two aquifer systems.

19482 (EGG-WM-9857) **Analysis of the low-level waste radionuclide inventory for the Radioactive Waste Management Complex performance assessment.** Plansky, L.E.; Hoiland, S.A. EG and G Idaho, Inc., Idaho Falls, ID (United States). Feb 1992. 226p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC07-76ID01570. Order Number DE92012374. Source: OSTI; NTIS; INIS; GPO Dep.

This report summarizes the results of a study to improve the estimates of the radionuclides in the low-level radioactive waste (LLW) inventory which is buried in the Idaho National Engineering Laboratory (INEL) Radioactive Waste Management Complex (RWMC) Subsurface Disposal Area (SDA). The work is done to support the RWMC draft performance assessment (PA). Improved radionuclide inventory estimates are provided for the INEL LLW generators. Engineering, environmental assessment or other research areas may find use for the information in this report. It may also serve as a LLW inventory baseline for data quality assurance. The individual INEL LLW generators, their history and their activities are also described in detail.

19483 (EGG-WTD-9980) **Identification of buried structures (aerial surveillance and analysis of buried waste) long-range project plan.** Williams, K.L. EG and G Idaho, Inc., Idaho Falls, ID (United States). Nov 1991. 31p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC07-76ID01570. Order Number DE92012216. Source: OSTI; NTIS; INIS; GPO Dep.

This long-range plan presents the plan (i.e., budget, schedule, justification, and plans for technology deployment) for implementation of the Identification of Buried Structures project. Two subcontractors will test and demonstrate their technologies at the Idaho National Engineering Laboratory during October and November 1991, and will analyze their data and submit final reports to EG&G Idaho, Inc., by the end of December 1991. By February 21, 1992, EG&G Idaho will present a final report to the Department of Energy, assessing the subcontractor's results and recommending further action.

19484 (EGG-WTD-10080) **Rapid monitoring of soil, smears, and air dusts by direct large-area alpha spectrometry.** Sill, C.W. EG and G Idaho, Inc., Idaho Falls, ID (United States). Jan 1992. 51p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC07-76ID01570. Order Number DE92012528. Source: OSTI; NTIS; INIS; GPO Dep.

Experimental conditions to permit rapid monitoring of soils, smears, and air dusts for transuranic (TRU) radionuclides under field conditions are described. The monitoring technique involves direct measurement of alpha emitters by alpha spectrometry using a large-area detector to identify and quantify the radionuclides present. The direct alpha spectrometry employs a circular gridded ionization chamber 35 cm in diameter which accommodates either a circular sample holder 25 cm in diameter or a rectangular one 20 by 25 cm (8 by 10 in.). Soils or settled dusts are finely ground, suspended in 30% ethanol, and sprayed onto a 25-cm stainless steel dish. Air dusts are collected with a high-volume sampler onto 20- by 25-cm membrane filters. Removable contamination is collected from surfaces onto a 20- by 25-cm filter using an 18-cm (7-in.) paint roller to hold the large filter in contact with the surface during sample collection. All three types of samples are then counted directly in the alpha spectrometer and no other sample preparation is necessary. Some results obtained are described.

19485 (EGG-WTD-10180) **Evaluation of airborne thermal, magnetic, and electromagnetic characterization technologies.** Josten, N.E. EG and G Idaho, Inc., Idaho Falls, ID (United States). Mar 1992. 69p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC07-76ID01570. Order Number DE92013101. Source: OSTI; NTIS; INIS; GPO Dep.

The identification of Buried Structures (IBS) or Aerial Surveillance Project was initiated by the US Department of Energy (DOE) Office of Technology Development to demonstrate airborne methods for locating and identifying buried waste and ordnance at the Idaho National Engineering Laboratory (INEL). Two technologies were demonstrated: (a) a thermal infrared imaging system built by Martin Marietta Missile Systems and (b) a magnetic and electromagnetic (EM) geophysical surveying system operated by EBASCO Environmental. The thermal system detects small differences in ground temperature caused by uneven heating and cooling of the ground by the sun. Waste materials on the ground can be detected when the temperature of the waste is different than the background temperature. The geophysical system uses conventional magnetic and EM sensors. These sensors detect disturbances caused by magnetic or conductive waste and naturally occurring magnetic or conductive features of subsurface soils and rock. Both systems are deployed by helicopter. Data were collected at four INEL sites. Tests at the Naval Ordnance Disposal Area (NODA) were made to evaluate capabilities for detecting ordnance on the ground surface. Tests at the Cold Simulated Waste Demonstration Pit were made to evaluate capabilities for detecting buried waste at a controlled site, where the location and depth of buried materials are known. Tests at the Subsurface Disposal Area and Stationary Low-Power Reactor-1 burial area were made to evaluate capabilities for characterizing hazardous waste at sites that are typical of DOE buried waste sites nationwide.

19486 (EMO-1045) **Contingent post-closure plan, hazardous waste management units at selected maintenance facilities, US Army National Training Center, Fort Irwin, California.** Pacific Northwest Lab., Richland, WA (United States). Environmental Management Operations. Jan 1992. 62p. Sponsored by Department of Defense, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE92012140. Source: OSTI; NTIS; INIS; GPO Dep.

The National Training Center (NTC) at Fort Irwin, California, is a US Army training installation that provides tactical experience for battalion/task forces and squadrons in a mid- to high-intensity combat scenario. Through joint exercises with US Air Force and other services, the NTC also provides a data source for improvements of training doctrines, organization, and equipment. To meet the training and operational needs of the NTC, several maintenance facilities provide general and direct support for mechanical devices, equipment, and vehicles. Maintenance products used at these facilities include fuels, petroleum-based oils, lubricating grease, various degreasing solvents, antifreeze (ethylene glycol), transmission fluid, brake fluid, and hydraulic oil. Used or spent petroleum-based products generated at the maintenance facilities are temporarily accumulated in underground storage tanks (USTs), collected by the NTC hazardous waste management contractor (HAZCO), and stored at the Petroleum, Oil, and Lubricant (POL) Storage Facility, Building 630, until shipped off site to be recovered, reused, and/or reclaimed. Spent degreasing solvents and other hazardous wastes are containerized and stored on-base for up to 90 days at the NTC's Hazardous Waste Storage Facility, Building 703. The US Environmental Protection Agency (EPA) performed an inspection and reviewed the hazardous waste management operations of the NTC. Inspections indicated that the NTC had violated one or more requirements of Subtitle C of the Resource Conservation and Recovery Act (RCRA) and as a result of these violations was issued a Notice of Noncompliance, Notice of Necessity for Conference, and Proposed Compliance Schedule (NON) dated October 13, 1989. The following post-closure plan is the compliance-based approach for the NTC to respond to the regulatory violations cited in the NON.

19487 (EPA-520/5-91-004) **Radiological surveys of naval facilities in the New London Harbor and on the Thames River, Connecticut.** Semler, M.O. (National Air and Radiation Environmental Lab., Montgomery, AL (United States)); Blanchard, R.L. Environmental Protection Agency, Washington, DC (United States). Office of Radiation Programs. Dec 1991. 44p. Sponsored by Environmental Protection Agency, Washington, DC (United States). Source: OSTI; INIS; US Environmental Protection Agency, Office of Radiation Programs, 401 M. Street, S.W., Washington, DC 20460.

This report presents results of the surveys conducted by NAREL personnel to assess levels of environmental radioactivity resulting from maintenance and operation of nuclear-powered warships at the New London Submarine Base (NLSB). General Dynamics Electric Boat Division, Sound Signature Facility, and the State Pier, all located within New London, Connecticut, Harbor on the Thames River. The purpose of the survey was to determine if activities related to nuclear-powered warships resulted in release of radionuclides which may contribute to significant population exposure of contamination of the environment.

19488 (ESH-EMS-90-0131) **The Savannah River Site's Groundwater Monitoring Program: First quarter, 1990.** Westinghouse Savannah River Co., Aiken, SC (United States); Exploration Resources, Inc., Athens, GA (United States). 18 Oct 1990. 628p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC09-89SR18035. Order Number DE92012662. Source: OSTI; NTIS; GPO Dep.

This report summarizes the Savannah River Site (SRS) groundwater monitoring program conducted in the first quarter of 1990. It includes the analytical data, field data, well activity data, and the other documentation for this program and provides a record of the program's activities and rationale and an official document of the analytical results. The groundwater monitoring program includes the following activities: installation, maintenance, and abandonment of monitoring wells, environmental soil borings, development of the sampling and analytical schedule, collection and analyses of groundwater samples, review of the analytical data and other data, maintenance of the databases containing groundwater monitoring data and related data, quality assurance (QA) evaluations of laboratory performance, and reports of results to waste-site facility custodians and to the Environmental Protection Section (EPS) of EPD.

19489 (ESH-EMS-90-0132) **The Savannah River Site's Groundwater Monitoring Program, second quarter 1990.** Westinghouse Savannah River Co., Aiken, SC (United States); Exploration Resources, Inc., Athens, GA (United States). 7 Feb 1991. 595p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC09-89SR18035. Order Number DE92013124. Source: OSTI; NTIS; GPO Dep.

The Environmental Protection Department/Environmental Monitoring Section (EPD/EMS) administers the Savannah River Site's (SRS) Groundwater Monitoring Program. During second quarter 1990 (April through June) EPD/EMS conducted routine sampling of monitoring wells and drinking water locations. EPD/EMS established two sets of flagging criteria in 1986 to assist in the management of sample results. The flagging criteria aid personnel in sample scheduling, interpretation of data, and trend identification. The flagging criteria are based on detection limits, background levels in SRS groundwater, and drinking water standards. An explanation of flagging criteria for the second quarter is presented in the Flagging Criteria section of this document. All analytical results from second quarter 1990 are listed in this report.

19490 (ESH-EMS-890043) **The Savannah River Site's Groundwater Monitoring Program, first quarter 1989.** Westinghouse Savannah River Co., Aiken, SC (United States); Exploration Resources, Inc., Athens, GA (United States). [1989]. 481p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC09-89SR18035. Order Number DE92013085. Source: OSTI; NTIS; GPO Dep.

The Environmental Monitoring Section of the Environmental and Health Protection (EHP) Department administers the Savannah River Site's Groundwater Monitoring Program. During first quarter 1989 (January–March), EHP conducted routine sampling of monitoring wells and drinking water locations. EHP collected the drinking water samples from Savannah River Site (SRS) drinking water systems supplied by wells. EHP established two sets of flagging criteria in 1986 to assist in the management of sample results. The flagging criteria aid personnel in sample scheduling, interpretation of data, and trend identification. The flagging criteria are based on detection limits, background levels in SRS groundwater, and drinking water standards. An explanation of flagging criteria for the first quarter is presented in the Flagging Criteria section of this document. All analytical results from first quarter 1989 are listed in this report, which is distributed to all waste-site custodians.

19491 (ESH-EMS-890044) **The Savannah River Site's Groundwater Monitoring Program, second quarter 1989.** Westinghouse Savannah River Co., Aiken, SC (United States); Exploration Resources, Inc., Athens, GA (United States). [1989]. 455p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC09-89SR18035. Order Number DE92013084. Source: OSTI; NTIS; GPO Dep.

The Environmental Monitoring Section of the Environmental and Health Protection (EHP) Department administers the Savannah River Site's Groundwater Monitoring Program. During second quarter 1989 (April–June), EHP conducted routine sampling of monitoring wells and drinking water locations. EHP collected the drinking water samples from Savannah River Site (SRS) drinking water systems supplied by wells. EHP established two sets of flagging criteria in 1986 to assist in the management of sample results. The flagging criteria aid personnel in sample scheduling, interpretation of data, and trend identification. The flagging criteria are based on detection limits, background levels in SRS groundwater, and drinking water standards. An explanation of flagging criteria for the second quarter is presented in the Flagging Criteria section of this document. All analytical results from second quarter 1989 are listed in this report, which is distributed to all waste-site custodians.

19492 (ESH-EMS-890045) **The Savannah River Site's Groundwater Monitoring Program, third quarter 1989.** Westinghouse Savannah River Co., Aiken, SC (United States); Exploration Resources, Inc., Athens, GA (United States). [1989]. 479p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC09-89SR18035. Order Number DE92013082. Source: OSTI; NTIS; GPO Dep.

The Environmental Monitoring Section of the Environmental and Health Protection (EHP) Department administers the Savannah River Site's Groundwater Monitoring Program. During third quarter 1989 (July–September), EHP conducted routine sampling of monitoring wells and drinking water locations. EHP collected the drinking water samples from Savannah River Site (SRS) drinking water systems supplied by wells. EHP established two sets of flagging criteria in 1986 to assist in the management of sample results. The flagging criteria do not define contamination levels; instead they aid personnel in sample scheduling, interpretation of data, and trend identification. The flagging criteria are based on detection limits, background levels in SRS groundwater, and drinking water standards. An explanation of flagging criteria for the third quarter is presented in the Flagging Criteria section of this document. All analytical results from third quarter 1989 are listed in this report, which is distributed to all waste-site custodians.

19493 (ESH-EMS–890046) **The Savannah River Site's Groundwater Monitoring Program: Fourth quarter, 1989.** Westinghouse Savannah River Co., Aiken, SC (United States); Exploration Resources, Inc., Athens, GA (United States). [1989]. 472p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC09-89SR18035. Order Number DE92013267. Source: OSTI; NTIS; GPO Dep.

The Environmental Monitoring Section of the Environmental and Health Protection (EHP) Department administers the Savannah River Site's Groundwater Monitoring Program. During fourth quarter 1989 (October–December), EHP conducted routine sampling of monitoring wells and drinking water locations. EHP collected the drinking water samples from Savannah River Site (SRS) drinking water systems supplied by wells. EHP established two sets of flagging criteria in 1986 to assist in the management of sample results. The flagging criteria aid personnel in sample scheduling, interpretation of data, and trend identification. An explanation of flagging criteria for the fourth quarter is presented in the Flagging Criteria section of this document. All analytical results from fourth quarter 1989 are listed in this report, which is distributed to all waste-site custodians.

19494 (ESH-EMS–900133) **The Savannah River Site's groundwater monitoring program: Third quarter 1990.** Westinghouse Savannah River Co., Aiken, SC (United States); Exploration Resources, Inc., Athens, GA (United States). 6 May 1991. 728p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC09-89SR18035. Order Number DE92012661. Source: OSTI; NTIS; INIS; GPO Dep.

The Environmental Protection Department/Environmental Monitoring Section (EPD/EMS) administers the Savannah River Site's (SRS) Groundwater Monitoring Program. During third quarter 1990 (July through September) EPD/EMS conducted routine sampling of monitoring wells and drinking water locations. EPD/EMS established two sets of flagging criteria in 1986 to assist in the management of sample results. The flagging criteria do not define contamination levels; instead they aid personnel in sample scheduling, interpretation of data, and trend identification. The flagging criteria are based on detection limits, background levels in SRS groundwater, and drinking water standards. All analytical results from third quarter 1990 are listed in this report, which is distributed to all site custodians. One or more analytes exceeded Flag 2 in 87 monitoring well series. Analytes exceeded Flat 2 for the first since 1984 in 14 monitoring well series. In addition to groundwater monitoring, EPD/EMS collected drinking water samples from SRS drinking water systems supplied by wells. The drinking water samples were analyzed for radioactive constituents.

19495 (ESH-EMS–900134) **The Savannah River Site's Groundwater Monitoring Program: Fourth quarter, 1990.** Westinghouse Savannah River Co., Aiken, SC (United States); Exploration Resources, Inc., Athens, GA (United States). 18 Jun 1991. 567p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC09-89SR18035. Order Number DE92011908. Source: OSTI; NTIS; GPO Dep.

This report summarizes the Savannah River Site (SRS) groundwater monitoring program conducted in the fourth quarter of 1990. It includes the analytical data, field data, well activity data, and other documentation for this program, provides a record of the program's activities and rationale, and serves as an official document of the analytical results. The groundwater monitoring program includes the following activities: installation, maintenance, and abandonment of monitoring wells, environmental soil borings, development of the sampling and analytical schedule, collection and analyses of groundwater samples, review of analytical and other data, maintenance of the databases containing groundwater monitoring data, quality assurance (QA) evaluations of laboratory performance, and reports of results to waste-site facility custodians and to the Environmental Protection Section (EPS) of EPD.

19496 (ESH-EMS–910088) **The Savannah River Site's Groundwater Monitoring Program: Second quarter, 1991.** Westinghouse Savannah River Co., Aiken, SC (United States); Exploration Resources, Inc., Athens, GA (United States). 10 Jan 1992. 568p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC09-89SR18035. Order Number DE92013263. Source: OSTI; NTIS; GPO Dep.

The Environmental Protection Department/Environmental Monitoring Section (EPD/EMS) administers the Savannah River Site's (SRS) Groundwater Monitoring Program. During second quarter 1991 EPD/EMS conducted extensive sampling of monitoring wells. EPD/EMS established two sets of flagging criteria in 1986 to assist in the management of sample results. The flagging criteria do not define contamination levels; instead, they aid personnel in sample scheduling, interpretation of data, and trend identification. Beginning in 1991, the flagging criteria are based on EPA drinking water standards and method detection limits. A detailed explanation of the current flagging criteria is presented in the Flagging Criteria section of this document. Analytical results from second quarter 1991 are listed in this report.

19497 (EUR–12503(v.1)) **Development of modelling and forecasting in geology. (Volume 1): Evaluation of weathering and erosion velocity in different media.** Afzali, H. (Bureau de Recherches Geologiques et Minieres (BRGM), 45 - Orleans (France)); Fourniguet, J.; Peaudecerf, P. Commission of the European Communities, Luxembourg (Luxembourg). 1990. 49p. (In French). Contract FI1W/0048-F. Source: OSTI; NTIS (US Sales Only).

To assess the long-term safety of radioactive waste disposal systems, validation of predictive models is essential and large efforts should be given to barriers, particularly geologic barriers. This work appears in the form of four volumes, the subject of the first part is described below. Soils and rocks erosion depends upon climate, relief, lithology and human activities (deforesting). In the world, mechanical erosion is evaluated from 5 to 8 cm per 1000 years (mean denudation ratio). Rocks weathering solubilize chemical elements in the running water and rocks fracturation becomes more easily under erosion effects. Alteration front progress is 0.3-3 cm per 1000 years in temperate zones and 4-7 cm per 1000 years in tropical zones. 5 figs., 14 tabs., 80 refs.

19498 (EUR–12503(v.2)) **Development of modelling and forecasting in geology. (Volume 2): Herode model: weathering and erosion computerized simulation.** Seguin, J.J. (Bureau de Recherches Geologiques et Minieres (BRGM), 45 - Orleans (France)); Fourniguet, J.; Peaudecerf, P. Commission of the European Communities, Luxembourg (Luxembourg). 1990. 100p. (In French). Contract FI1W/0048-F. Source: OSTI; NTIS (US Sales Only).

To access the long-term safety of radioactive waste disposal systems, validation of predictive models is essential and large efforts should be given to barriers, particularly geologic barriers. This work appears in the form of four volumes, the subject of the second part is described below. HERODE (calculation of relief altitude under erosion process from 0 to 100000 years) is a weathering and erosion computerized simulation. The model describes materials and rocks transport and also substratum weathering process. FORTRAN 77 is the software language. 31 figs., 6 tabs., 40 refs.

19499 (EUR–12503(v.3)) **Development of modelling and forecasting in geology (Volume 3): Glaciation influence simulation on rocks deformations and run-off in sedimentary serie.** Modaressi, H. (Bureau de Recherches Geologiques et Minieres (BRGM), 45 - Orleans (France)); Gentier, S; Fourniguet, J.; Peaudecerf, P. Commission of the European Communities, Luxembourg (Luxembourg). 1990. 89p. (In French). Contract FI1W/0048-F. Source: OSTI; NTIS (US Sales Only).

To access the long-term safety of radioactive waste disposal systems, validation of predictive models is essential and large efforts should be given to barriers, particularly geologic barriers. This work appears in the form of four volumes, the subject of the third part is described below. This work shows the compacting effects on a sedimentary serie and the consequences on fluid flows in water-table with an ice-cape progressive arrival. The fast advance of the glacier prevents from the entire sedimentary beds consolidation and it appears a horizontal fluid flow along the progression axis. The computerized simulation uses GEFDYN code, a finite elements code. 27 figs., 12 refs.

19500 (GEO-EIS–86) **Characterization of groundwater flow and transport in the General Separations Areas, Savannah River Plant: Flow model refinement and particle-tracking analysis report.** Duffield, G.M. (GeoTrans, Inc., Sterling, VA (United States)); Buss, D.R.; Root, R.W. Jr.; Hughes, S.S.; Mercer, J.W. Du Pont de Nemours (E.I.) and Co., Aiken, SC (United States). Savannah River Lab.; GeoTrans, Inc., Sterling, VA (United States). Mar 1986. 155p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC09-89SR18035 ;AC09-76SR00001. Order Number DE92013128. Source: OSTI; NTIS; GPO Dep.

The Department of Energy (DOE) is preparing the necessary NEPA documentation for an Environmental Impact Statement (EIS) to address the waste disposal activities for groundwater protection at the Savannah River Plant (SRP). For purposes of this EIA, the areas within the plant have been separated into 26 functional groups based primarily on hydrogeologic setting and types of disposed waste materials. The overall objective is to provide an appropriate quantitative assessment of the environmental impacts from past and future operations within each functional group. The analysis from each functional group will be integrated to assess the impacts of plant-wide operations. A flexible approach to quantifying the impacts using several methods of quantitative analysis is being employed. Numerical flow and transport modeling is one method being applied to several functional groups. The scope of work can be divided into four broad categories: (1) Data Review and Conceptual Model Development, (2) Groundwater Flow Model Construction and Refinement, (3) Solute Transport Model Construction, and (4) Remedial Alternative Simulations. The major topics covered in this report are: (1) summary of the hydrogeologic conditions of the area, (2) observed flow velocities at the study site, (3) a summary of results from the preliminary flow modeling effort, (4) flow model refinement and results, and (5) particle tracking analyses based on the refined flow model.

19501 (GSF-HY–1/91) **Annual report 1990 of the GSF Institute of Hydrology.** GSF - Forschungszentrum fuer Umwelt und Gesundheit GmbH, Neuherberg (Germany). Inst. fuer Hydrologie. Oct 1991. 182p. (In German). Order Number DE92511426. Source: OSTI; NTIS (US Sales Only); INIS.

The main areas of activities in the period under review are the material cycles, the geochemistry of heavy metals and of radionuclides, and the transport of substances in the aquatic environment and the atmospheric environment, with particular emphasis on the ground water and the substances dissolved therein. Site-specific hydro-geological studies and studies into the isotope hydrology, also at the sites of repositories, are presented. Within the framework of investigations of the poleo-climate, the Institute carried out studies on the isotope stratigraphy in the Antarctica. Novel developments in tracer techniques are reported. (DG).

19502 (GSF-HY–1/91, pp. 91-100) **Study into the underground production of the isotopes ^{39}Ar, ^{4}He, ^{222}Rn in aquifers of selected mineral waters.** Forster, M.; Weise, S.; Ramm, K.; Baumann, M. GSF - Forschungszentrum fuer Umwelt und Gesundheit GmbH, Neuherberg (Germany). Inst. fuer Hydrologie. Oct 1991. (In German). In *Annual report 1990 of the GSF Institute of Hydrology.* 182p. Order Number DE92511426. Source: OSTI; NTIS (US Sales Only); INIS.

The underground production of the environmental isotopes in ground-water aquifers of the spa Bad Steben, at Kondrau, Windisch-Eschenbach, and Mitterteich have been performed for detecting Ar-39 in particular. The contents of He-3/He-4, Rn-222 and Ra-226 of these ground waters have been used as parameters indicating underground isotope production, together with the U and Th concentrations in the aquifer water samples. The H-3, C-14 and Kr-85 concentrations have been used to infer the mean residence times of the ground waters. (DG).

19503 (GSF-HY–1/91, pp. 115-119) **Radiohydrometric investigations.** Drost, W.; Hofreiter, G.; Reichlmayr, E.; Weindl, W. GSF - Forschungszentrum fuer Umwelt und Gesundheit GmbH, Neuherberg (Germany). Inst. fuer Hydrologie. Oct 1991. (In German). In *Annual report 1990 of the GSF Institute of Hydrology.* 182p. Order Number DE92511426. Source: OSTI; NTIS (US Sales Only); INIS.

The investigations were to determine the parameters of the ground-water flow and the aquifer, pridominantly in loose rock. The paper reports in particular on measurements intended to solve problems encountered in connection with work for road and building construction and hydraulic works at the site of the planned research reactor II in Garching/Bavaria, for a tunnel near Starnberg, and for the dams planned at Sylvenstein, Lac Salaufe, Brombach, and Kleine Roth. (DG).

19504 (GSF-HY–1/91, pp. 136-140) **Design of an equipment for measuring Krypton-85 in water for age determination of young ground waters.** Held, J.; Schuhbeck, S.; Rauert, W. GSF - Forschungszentrum fuer Umwelt und Gesundheit GmbH, Neuherberg (Germany). Inst. fuer Hydrologie. Oct 1991. (In German). In *Annual report 1990 of the GSF Institute of Hydrology.* 182p. Order Number DE92511426. Source: OSTI; NTIS (US Sales Only); INIS.

Krypton-85 dissolved in water can be used as an indicator for determination of age and classification of young ground waters with mean residential periods of up to several decades. With the method and equipment reported in the paper, the Kr-85 is extracted from the water and is measured in a flow-through methane counter. (DG).

19505 (GSF-HY–1/91, pp. 150-153) **Synthesis of propane via hydrogenation of propadiene, propyne or propene, for low-level measurement of tritium.** Wolf, M.; Singer, C. GSF - Forschungszentrum fuer Umwelt und Gesundheit GmbH, Neuherberg (Germany). Inst. fuer Hydrologie. Oct 1991. (In German). In *Annual report 1990 of the GSF Institute of Hydrology.* 182p. Order Number DE92511426. Source: OSTI; NTIS (US Sales Only); INIS.

Very small tritium accumulations in ground water can be measured by means of scanning propane, prepared by partial, electrolytic enrichment with tritium, in a gas proportional counter. It is shown that for most applications propyne or propene can be used for counting gas preparation instead of propadiene, as the detection limits achieved with them are 0.095 or 0.12 TU, respectively. (DG).

19506 (HAN–17226) **Cooperation with US Geological Survey.** Hanford Works, Richland, WA (United States). 6 Aug 1948. 2p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE92011857. Source: OSTI; NTIS (US Sales Only); GPO Dep.

This is a reference made to a memorandum about the cooperation between the Hanford Site and the US Geological Survey. The US Geological Survey was at the site to work with Hanford on geological problems the site was having. They worked together to locate the water supply wells of the site which would be coordinated with the drilling program. They also worked together on the possible contamination to the 300 and 3000 area wells. (MB)

19507 (HPR–87-002) **The Savannah River Plant's Waste-Site Groundwater Monitoring Program: Third quarter 1986.** Heath, E.M. (Du Pont de Nemours (E.I.) and Co., Aiken, SC (United States)); Taus, L.B.; Olson, C.M. Du Pont de Nemours (E.I.) and Co., Aiken, SC (United States). Savannah River Plant; Exploration Software, Athens, GA (United States). [1986]. 183p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC09-89SR18035. Order Number DE92013081. Source: OSTI; NTIS; GPO Dep.

The Savannah River Plant Groundwater Monitoring Program is administered by the Environmental Monitoring Group of the Health Protection Department. There are 331 active groundwater wells at 61 monitoring sites that are sampled and analyzed. Each sample may be analyzed for up to 41 parameters depending on the site history and location. Two sets of flagging criteria were established during the first quarter of 1986 to assist in the management of sample results. The flagging criteria do not define contamination levels, but are intended to aid personnel in sample scheduling, interpretation of data, and trend identification. The first-level flagging criteria are based on detection limits or background levels in SPR groundwater. The second-level flagging criteria are based on standards for each parameter. All analytical results from the third quarter (July–September) of 1986 are listed in this report, which will be distributed to all waste-site custodians.

19508 (HPR–87-158) **The Savannah River Plant's Groundwater Monitoring Program: First quarter 1987.** Heath, E.M. (Du Pont de Nemours (E.I.) and Co., Aiken, SC (United States)); Taus, L.B.; Olson, C.M. Du Pont de Nemours (E.I.) and Co., Aiken, SC (United States). Savannah River Plant; Exploration Software, Athens, GA (United States). [1987]. 211p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC09-89SR18035. Order Number DE92013077. Source: OSTI; NTIS; INIS; GPO Dep.

The Savannah River Plant's Groundwater Monitoring Program is administered by the Environmental Monitoring Group of the Health Protection Department. During the first quarter of 1987 (January–March) comprehensive monitoring including tritium analyses was performed on the waste-site monitoring wells. Radioactive monitoring wells were monitored routinely. All analytical results from the first quarter of 1987 are listed in this report, which will be distributed to all waste-site custodians. There were 61 monitoring sites in which one or more parameters exceeded the second-level flagging criteria. There were 23 monitoring sites that had parameters exceeding the second-level flagging criteria for the first time since 1984. Those sites with constituents above the second-level flagging criteria in the first quarter of 1987 are listed in the following table and organized by location.

19509 (HPR–88-098) **The Savannah River Plant's Groundwater Monitoring Program, fourth quarter 1987.** Du Pont de Nemours (E.I.) and Co., Aiken, SC (United States). Savannah River Plant; Exploration Software, Athens, GA (United States). [1987]. 224p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC09-89SR18035. Order Number DE92013086. Source: OSTI; NTIS; GPO Dep.

The Savannah River Plant's Groundwater Monitoring Program is administered by the Environmental Monitoring Group of the Health Protection Department. During the fourth quarter of 1987 (October–December), routine monitoring was performed on monitoring wells and drinking water locations. This quarterly report includes the radioactive monitoring data from drinking water. These data were collected from SRP drinking water systems supplied by wells. Two sets of flagging criteria were established in 1986 to assist in the management of sample results. The flagging criteria do not define contamination levels but are intended to aid personnel in sample scheduling, interpretation of data, and trend identification. The first-level flagging criteria are based on detection limits or background levels in SRP groundwater. The second-level flagging criteria are based on various water standards or levels significantly above background. During the fourth quarter of 1987, Priority Pollutant analyses were conducted on LFW wells and Appendix IX analyses were conducted on FSB point-of-compliance wells. Also during this quarter, one drinking water sample exceeded the first-level flagging criteria.

19510 (HPR–88-238) **The Savannah River Plant's Groundwater Monitoring Program: First quarter, 1988.** Du Pont de Nemours (E.I.) and Co., Aiken, SC (United States). Savannah River Plant; Exploration Software, Athens, GA (United States). [1988]. 312p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC09-89SR18035 ;AC09-76SR00001. Order Number DE92013389. Source: OSTI; NTIS; GPO Dep.

This report is a summary of the groundwater monitoring program conducted by the Environmental Monitoring Group of the Health Protection Department in the first quarter of 1988 and includes the analytical results, field data, and detailed documentation for this program. The purpose of this report is two-fold. First, the report provides a historical record of the activities and the rationale of the program; second, it provides an official document of the analytical results.

19511 (HPR–88-300) **The Savannah River Plant's Groundwater Monitoring Program, second quarter 1988.** Du Pont de Nemours (E.I.) and Co., Aiken, SC (United States). Savannah River Plant; Exploration Software, Athens, GA (United States). [1988]. 316p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC09-89SR18035 ;AC09-76SR00001. Order Number DE92013388. Source: OSTI; NTIS; GPO Dep.

The Savannah River Plant's Groundwater Monitoring Program is administered by the Environmental Monitoring Group of the Health Protection Department. During the second quarter of 1988 (April–June), routine monitoring was performed on monitoring wells and drinking water locations. This quarterly report includes the radioactive monitoring data from drinking water. These data were collected from Savannah River Plant (SRP) drinking water systems supplied by wells. Two sets of flagging criteria were established in 1986 to assist in the management of sample results. The flagging criteria do not define contamination levels but are intended to aid personnel in sample scheduling, interpretation of data, and trend identification. The first-level flagging criteria are based on detection limits or background levels in SRP groundwater. The second-level flagging criteria are based on various water standards or levels considerably above background. One drinking water sample exceeded the first-level flagging criteria during this quarter.

19512 (HPR–88-489) **The Savannah River Plant's Groundwater Monitoring Program, third quarter 1988.** Du Pont de Nemours (E.I.) and Co., Aiken, SC (United States). Savannah River Plant; Exploration Software, Athens, GA (United States). [1988]. 294p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC09-89SR18035. Order Number DE92013141. Source: OSTI; NTIS; GPO Dep.

The Environmental Monitoring Group of the Health Protection Department administers the Savannah River Plant's Groundwater Monitoring Program. During third quarter 1988 (July–September), routine sampling of monitoring wells and drinking water locations was performed. The drinking water samples were collected from Savannah River Plant (SRP) drinking water systems supplied by wells. Two sets of flagging criteria were established in 1986 to assist in the management of sample results. The flagging criteria do not define contamination levels but are intended to aid personnel in sample scheduling, interpretation of data, and trend identification. The flagging criteria are based on detection limits, background levels in SRP groundwater, and drinking water standards. An explanation of flagging criteria for the third quarter is presented in the Flagging Criteria section of this document. All analytical results from third quarter 1988 are listed in this report, which is distributed to all waste-site custodians.

19513 (INIS-GB–433) **Annual report on radioactive discharges and monitoring of the environment 1990. V. 1: Report on discharges and environmental monitoring.** British Nuclear Fuels plc, Risley (United Kingdom). Health and Safety Directorate. 1991 88p. Order Number DE92627847. Source: OSTI; NTIS (US Sales Only); INIS.

This Annual Report supplements the Health and Safety Annual Report of British Nuclear Fuels plc by providing more detailed information on radioactive discharges, monitoring of the environment and critical group doses. This report has been sub-divided into two complementary parts. Volume I includes annual data for each of the Company sites on radioactive discharges into the environment and the associated environmental monitoring programmes. The sites involved are: Sellafield where the main activities are irradiated nuclear fuel reprocessing and the Calder Hall nuclear station; the Drigg radioactive waste storage and disposal site; the Chapelcross nuclear power station; Springfields Works which manufactures nuclear fuels; Capenhurst Works where uranium isotopic enrichment plants are operated. Volume II reproduces the Certificates of Authorisation under which the Company operates and the statutory environmental monitoring programmes which relate to them. (author).

19514 (ITPR–91018) **Activity concentrations of iodine-131 and radiocesium in milk.** Rabitsch, H.; Kahr, G.; Oswald, K. Technische Univ., Graz (Austria). Inst. fuer Theoretische Physik und Reaktorphysik. Dec 1991. 38p. (In German). Order Number DE92626180. Source: OSTI; NTIS (US Sales Only); INIS.

We have measured the activity concentrations of iodine-131 and radiocesium in pasteurized fresh milk following the Chernobyl accident. Average monthly concentrations of radiocesium are given until December 1991. Samples originated from the local dairy (Milchhof

Graz, Austria) and the measured activities in milk represent a large part of the total intake in the population of Graz. Observed activities are also compared with the activity levels obtained after the earlier nuclear contaminations. From the data of our measurements for radiocesium we have estimated the internal effective dose equivalent due to the intake of contaminated milk during the first year after the fallout. Results indicate that the averaged consumer rates for milk, usually used for predictions of dose, were too high. We have also observed great differences in the activity levels of raw milk and the activities in milk consumed by the population. (authors).

19515 (IVL-B–1044) **Liming and fertilization of forest soils in Germany and Sweden.** Westling, O. Swedish Environmental Research Inst., Lammhult (Sweden). IVL-Aneboda. Nov 1991. 15p. (In Swedish). Order Number DE92506564. Source: OSTI; NTIS (US Sales Only).

This report summarizes background and experiences from forest soil treatments in southern Germany, where large areas have been treated with limestone and fertilized with phosphorus and potassium. Comparisons is made with air pollution exposed forest areas in southern Sweden, and the need for remedial actions is discussed from different viewpoints regarding soil treatments: * To prevent further soil acidification, * Soil restoration regarding base cations and other nutrients, * Remedy existing or expected nutrient shortages in forest stands, and * Compensate for biomass harvesting. 18 refs.

19516 (JAERI-M–91-210) **Diminution of terrestrial gamma ray exposure rate due to snow cover: Ground survey and aerial survey.** Nagaoka, Toshi (Japan Atomic Energy Research Inst., Tokai, Ibaraki (Japan). Tokai Research Establishment); Sakamoto, Ryuichi; Saito, Kimiaki; Tsutsumi, Masahiro; Moriuchi, Shigeru. Japan Atomic Energy Research Inst., Tokyo (Japan). Dec 1991. 27p. (In Japanese). Order Number DE92514960. Source: OSTI; NTIS (US Sales Only); INIS.

In order to clarify the diminution characteristics of terrestrial gamma ray exposure rate due to snow cover, measurements were performed on the ground with and without snow cover. Aerial measurement was also performed above the snow cover in order to obtain information about collective dose evaluation by means of wide and quick environmental survey. The diminution factors observed were 0.36 - 0.17 for the region of 12 - 23 g/cm^2 of water equivalent of the snow cover. According to a calculation by Monte Carlo method, the diminution factors for the same water equivalent range were 0.32 - 0.16. They agreed well as a whole, while the fluctuation of the factors measured were fairly large. The fluctuation is deemed to be due to the inhomogeneity in the distribution of the snow cover and the gamma ray field. The exposure rates on the ground with and without the snow cover were estimated using the aerial survey data with ARSAS (Aerial Radiological Survey and Assessment System). They agreed fairly well with that measured on the ground, while the range of the estimation was several 10%. The estimation range is expected to decrease with increasing the homogeneity of the distribution of the water equivalent and the gamma ray field. (author).

19517 (Juel–2546) **Investigations of soil-plant transfer of radiocesium after deposition from the Chernobyl reactor accident.** Bilo, M. Forschungszentrum Juelich GmbH (Germany). Inst. fuer Radioagronomie; Tuebingen Univ. (Germany). Nov 1991. 129p. (In German). Order Number DE92516927. Source: OSTI; NTIS (US Sales Only); INIS.

Due to the low deposition of radiocaesium in NRW after the Chernobyl accident of about 2500 Bq ^{137}Cs/m^2 and 720 Bq ^{134}Cs/m^2, radiocaesium was not detectable in cereals from NRW. A deposition of about 44,100 Bq ^{137}Cs/m^2 and 13,500 Bq ^{134}Cs/m^2 was calculated for the vicinity of Tannheim, a village in Upper Swabia. Nevertheless, the content of radiocaesium in grain from Upper Swabia was found to be more than one hundred times lower than that of natural ^{40}K. Transferfactors (TF/SP) for radiocaesium were determined for cereals from the three investigated soil types: Kalkvega (FAO classification: Calcaric Fluvisol), Braunerde (Cambisol) and Parabraunerde-Pseudogley (Luvisol-Planosol). The total variation in TF(SP) from 54 sampling sites was a factor of 43 (grain) and 18 (straw). However, the values did not reach the calculation basis of the German Regulatory Guide of 0.05 (Allgemeine Berechnungsgrundlage). The maximum TF(SP) for $^{134/137}$Cs in grain of 0.026 is clearly below that limit. A drastic increase of radioactivity in sewage sludge was observed in Upper Swabia. In the Tannheim sewage plant a radiocaesium content of about 12,500 Bq/kg dry matter was measured. In order to obtain further information on the possible radioecological consequences of using this sewage sludge as fertilizer a lysimeter study was carried out with application of the contaminated sewage sludge. Radioactivity in soil and several crops was measured for the growing periods 1989 and 1990. Although the soil type ('worst-case model') could have led one to expect high TF(SP) the increase of radiocaesium in plants was quite small. A higher uptake of radiocaesium by plants is caused by varying the potassium contents of the soil rather than by the application of the contaminated sewage sludge. (orig./HP).

19518 (K/GDP/SAR–15) **Review of earthquake hazard assessments of plant sites at Paducah, Kentucky, and Portsmouth, Ohio.** Martin Marietta Energy Systems, Inc., Oak Ridge, TN (United States); Geological Survey, Reston, VA (United States). Mar 1992. 254p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AI05-90OR21929 ;AC05-76OR00001. Order Number DE92012314. Source: OSTI; NTIS; INIS; GPO Dep.

Members of the US Geological Survey staff in Golden, Colorado, have reviewed the submissions of Lawrence Livermore National Laboratory (LLNL) staff and of Risk Engineering, Inc. (REI) (Golden, Colorado) for seismic hazard estimates for Department of Energy facilities at Portsmouth, Ohio, and Paducah, Kentucky. We reviewed the historical seismicity and seismotectonics near the two sites, and general features of the LLNL and EPRI/SOG methodologies used by LLNL and Risk Engineering respectively, and also the separate Risk Engineering methodology used at Paducah. We discussed generic issues that affect the modeling of both sites, and performed alternative calculations to determine sensitivities of seismic hazard results to various assumptions and models in an attempt to assign reasonable bounding values of the hazard. In our studies we find that peak acceleration values of 0.08 g for Portsmouth and 0.32 g for Paducah represent central values of the ground motions obtained at 1000-year return periods. Peak accelerations obtained in the LLNL and Risk Engineering studies have medians near these values (results obtained using the EPRI/SOG methodology appear low at both sites), and we believe that these medians are appropriate values for use in the evaluation of systems, structures, and components for seismic structural integrity and for the seismic design of new and improved systems, structures, and components at Portsmouth and Paducah.

19519 (LA–12301-MS) **Colloid research for the Nevada Test Site.** Bryant, E.A. Los Alamos National Lab., NM (United States). May 1992. 34p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. Order Number DE92011870. Source: OSTI; NTIS; INIS; GPO Dep.

Research is needed to understand the role of particulates in the migration of radionuclides away from the sites of nuclear tests at the Nevada Test Site. The process of testing itself may produce a reservoir of particles to serve as vectors for the transport of long-lived radionuclides in groundwater. Exploratory experiments indicate the presence of numerous particulates in the vicinity of the Cambric test but a much lower loading in a nearby well that has been pumped continuously for 15 years. Recent groundwater colloid research is briefly reviewed to identify sampling and characterization methods that may be applicable at the Nevada Test Site.

19520 (LA-UR–92-708) **Remote sensing applications of the extended radiosity method.** Gerstl, S.A.W.; Borel, C.C. Los Alamos National Lab., NM (United States). [1992]. 3p. Sponsored by Department of Defense, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-9205136–2: 1992 international geoscience and remote sensing symposium, Houston, TX (United States), 26-29 May 1992). Order Number DE92011356. Source: OSTI; NTIS; GPO Dep.

In this paper we describe the progress made in the last three years on developing the radiosity method for remote sensing applications. The research covered canopy modeling, volumetric scattering and atmospheric corrections for future analysis of EOS imaging spectrometer data.

19521 (LA-UR–92-709) **Atmospheric corrections of land imagery using the extended radiosity method.** Borel, C.C.; Gerstl, S.A.W. Los Alamos National Lab., NM (United States). [1992]. 5p. Sponsored by Department of Defense, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-9205136–3: 1992 international geoscience and remote sensing symposium, Houston, TX (United States), 26-29 May 1992). Order Number DE92011355. Source: OSTI; NTIS; GPO Dep.

In this paper we describe an application of the extended radiosity method to compute atmospheric scattering effects over heterogeneous surfaces and to perform the inverse operation: to correct for such atmospheric effects. The radiosity method is used to compute point-spread-functions. (PSF's) which determine how much light is scattered from an adjacent surface into the field-of-view (FOV) of a sensor above the atmosphere. We show that the PSF's are in general asymmetric for pointable airborne or satellite sensors. A Fourier transform based method can be used to correct adjacency-effect-blurred images for these atmospheric distortions.

19522 (LA-UR–92-924) **Lattice gas automata for flow and transport in geochemical systems.** Janecky, D.R.; Chen, S.; Dawson, S.; Eggert, K.C.; Travis, B.J. Los Alamos National Lab., NM (United States). [1992]. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-920761–11: 7. water-rock interaction conference, Park City, UT (United States), 9-23 Jul 1992). Order Number DE92011236. Source: OSTI; NTIS; GPO Dep.

Lattice gas automata models are described, which couple solute transport with chemical reactions at mineral surfaces within pore networks. Diffusion in a box calculations are illustrated, which compare directly with Fickian diffusion. Chemical reactions at solid surfaces, including precipitation/dissolution, sorption, and catalytic reaction, can be examined with the model because hydrodynamic transport, solute diffusion and mineral surface processes are all treated explicitly. The simplicity and flexibility of the approach provides the ability to study the interrelationship between fluid flow and chemical reactions in porous materials, at a level of complexity that has not previously been computationally possible.

19523 (LA-UR–92-971) **Computerized tomographic analysis of fluid flow in fractured tuff.** Felice, C.W. (Terra Tek, Inc., Salt Lake City, UT (United States)); Sharer, J.C.; Springer, E.P. Los Alamos National Lab., NM (United States). [1992]. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-9205106–2: 9. engineering mechanics conference of American Society of Civil Engineers (ASCE), College Station, TX (United States), 24-27 May 1992). Order Number DE92011232. Source: OSTI; NTIS; INIS; GPO Dep.

The purpose of this summary is to demonstrate the usefulness of X-ray computerized tomography to observe fluid flow down a fracture and rock matrix imbibition in a sample of Bandelier tuff. This was accomplished by using a tuff sample 152.4 mm long and 50.8 mm in diameter. A longitudinal fracture was created by cutting the core with a wire saw. The fractured piece was then coupled to its adjacent section to that the fracture was not expected. Water was injected into a dry sample at five flow rates and CT scanning performed at set intervals during the flow. Cross sectional images and longitudinal reconstructions were built and saturation profiles calculated for the sample at each time interval at each flow rate. The results showed that for the test conditions, the fracture was not a primary pathway of fluid flow down the sample. At a slow fluid injection rate into the dry sample, the fluid was imbibed into the rock uniformly down the length of the core. With increasing injection rates, the flow remained uniform over the core cross section through complete saturation.

19524 (LA-UR–92-985) **Adjacency-blurring-effect of scenes modeled by the radiosity method.** Borel, C.C.; Gerstl, S.A.W. Los Alamos National Lab., NM (United States). [1992]. 5p. Sponsored by Department of Defense, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-920471–4: International Society for Photo Optical Engineering (SPIE) conference, Orlando, FL (United States), 20-24 Apr 1992). Order Number DE92011496. Source: OSTI; NTIS; GPO Dep.

In this paper we describe a method to simulate images through a scattering atmosphere. We compute the scattering of light from adjacent surfaces into the field-of-view (FOV) with the extended radiosity method. Our simulation takes aerosol scattering phase functions and ground bidirectional reflectance distributions (BRDF) into account. 10 refs.

19525 (LA-UR–92-1004) **Speciation of uranium(VI) sorption complexes on montmorillonite.** Chisholm-Brause, C.J. (Los Alamos National Lab., NM (United States)); Morris, D.E.; Richard, R.E. Los Alamos National Lab., NM (United States). [1992]. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-920761–10: 7. water-rock interaction conference, Park City, UT (United States), 9-23 Jul 1992). Order Number DE92011227. Source: OSTI; NTIS; GPO Dep.

Environmental contaminant releases that contain uranium are among the most serious problems that must be confronted by restoration programs. To facilitate restoration, information concerning the speciation of uranium is needed. Under oxidizing conditions, dissolved uranium is predominantly in the U(VI) (uranyl) form and is quite mobile in the environment, however sorption onto soils may retard its movement. In this study, we have investigated the effects of changes in solution speciation on the nature of uranyl sorption complexes on montmorillonite, a common soil constituent. Aqueous U(VI) solutions between pH 3 to 7 were batch-equilibrated with montmorillonite for several days; specific pH values were selected such that the solutions consisted of dominantly monomeric, oligomeric, or a mix of monomeric and oligomeric aqueous uranyl species. Emission spectroscopy was used to investigate the nature of U(VI) sorbed to montmorillonite.

19526 (NEI-DK–803) **External radiation doses from deposed fly ash with a content of ^{40}K, ^{226}Ra and ^{232}Th.** Hedemann Jensen, P. Risoe National Lab., Roskilde (Denmark). Health Physics Dept. Dec 1991 25p. (In Danish). Order Number DE92627849. Source: OSTI; NTIS (US Sales Only); INIS.

Fly ash from coal fired power plants might be used as filling material below buildings used for habitation. The fly ash content of the radionuclides of potassium, thorium and radium can cause external exposure of the inhabitants to γ radiation emitted during the radioactive decay of those radionuclides. Methods for calculation of the γ dose rate in air at indoor and outdoor positions are described. The dependence of the air dose rate on the vertical and horizontal dimensions of the fly ash material and on the thickness of a covering layer of soil or sand is analysed. The effective annual dose to inhabitants are calculated for typical Danish housing conditions with the buildings placed on a layer of fly ash of infinite vertical and horizontal dimensions and covered by soil or sand of varying thickness. (au) 10 refs.

19527 (NEI-NO–218) **Use of the Birkenes model to study the effects of stream and soil acidification.** Stone, A. Oslo Univ. (Norway). Inst. for Kjemi. 1990 219p. Order Number DE92506563. Source: OSTI; NTIS (US Sales Only).

Mathematical simulation models have long provided scientists with a useful tool for studying the complexities of natural systems, and streamwater acidification models are no exception. The Birkenes model (BIM) has been used in this research to investigate hydrological pathways through the use of long data sets covering a wide range of hydrological conditions and of information provided by conservative tracers such as ^{18}O and Cl^-. Addition of an automatic multi-signal calibration routine has enhanced this process and provided a mathematical tool which provides information on a model structure and parameter identifiability. Few simulation models have undergone so stringent an evaluation process as has the BIM. This indepth evaluation is necessary as it helps to test if the current model structure is capable of approximating natural processes. Without this evaluation, model results are open to considerable inaccuracies and errors. The results indicate that the BIM, although a gross simplification of natural processes, provides a reasonable estimate of streamwater concentrations from data inputs. Several weaknesses were identified particularly in submodels dealing with such species as SO_4 = and Al^{3+}. However, given its simplicity, the BIM can provide simulations for a wide range of chemical species. In addition, the model has been evaluated using data from a catchment which is very chemically and physically different from Birkenes, providing information on the transferability of the model and the quality of the approximations of the inherent chemical processes. The simulations were effected with a modicum of success suggesting that the current model structure can provide useful information about and approximations of chemical processes under a variety of conditions.

19528 (OEFZS–4614) **Modelling of radionuclide transfer to man and the radioecological model OECOSYS.** Gerzabek, M.H. Oesterreichisches Forschungszentrum Seibersdorf GmbH (Austria). Jan 1992. 14p. (In German). Order Number DE92625796. Source: OSTI; NTIS (US Sales Only); INIS.

Several processes of radionuclide transport in agro-ecological systems and possible quantitative models are outlined. In particular are treated: dry and wet deposition, uptake into plants via leaves and roots, transfer plant-animal and influence of food processing on the nuclide content of foodstuff. Data from literature and data obtained from the radio-ecological model OECOSYS are used. Finally some examples of model calculations based on the Chernobyl scenario in Austria are presented. The results are compared to measurements performed in 1986 and 1987. (author, translated by Quittner).

19529 (ORNL-MIT–124) **Evaluation of porous carbon and ceramic supports for hyperfiltration.** Cabellon, J.B.; Padia, A.K.; Whitesides, L.E. Jr. Massachusetts Inst. of Tech., Oak Ridge, TN (United States). School of Chemical Engineering Practice-Oak Ridge Station. 24 Mar 1971. 37p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. Order Number DE92013030. Source: OSTI; NTIS; GPO Dep.

Porous carbon and ceramic tubes were evaluated as supports for dynamically formed zirconium (IV) hydrous oxide-polycarboxylic acid hyperfiltration membranes. The most promising membranes were formed on Union Carbide 6-C carbon tubes using a 150,000 molecular weight polyacrylic acid. Sodium chloride rejections as high as 97% were obtained at water fluxes of 80 gpd/ft^2 compared with rejections of 90 to 95% and fluxes of 130 gpd/ft^2 using the porous stainless steel-Acropor/Millipore supports. The effects of pressure, circulation velocity, and temperature on membrane flux and sodium chloride and Coalinga water rejections were studied. A small industrial module containing 6-C carbon supports with a 3.04 ft^2 filtration surface gave a salt rejection of 86% and a product water flux of 60 gpd/ft^2.

19530 (ORNL/TM–11730) **Potential soil contaminant levels of polychlorinated dibenzodioxins and dibenzofurans at industrial facilities employing heat transfer operations.** Korte, N.E.; Muhr, C.A.; Greene, D.W. Oak Ridge National Lab., Grand Junction, CO (United States). Apr 1992. 36p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. Order Number DE92013161. Source: OSTI; NTIS; GPO Dep.

Environmental Sciences Division Publication No. 3614.

Certain manufacturing facilities formerly used large quantities of polychlorinated biphenyl (PCB) fluids in heat transfer operations. At many of these locations, operations have also involved PCB-containing electrical equipment. Commonly, over many years of plant operations, spills and leaks have resulted in PCB soil contamination. Dioxins and furans have been associated with PCB contamination in both the technical and popular press. Consequently, the need for analyses for dioxins and furans must be evaluated at locations where soils are contaminated with PCBs. This report presents an evaluation of potential dioxin and furan soil contamination based on heat transfer operations and spills from electrical equipment. The following five scenarios were examined for dioxin and furan contamination: (1) impurities in heat transfer fluids, (2) formation during heat transfer operations, (3) pyrolysis of heat transfer fluids, (4) impurities in dielectric fluids, and (5) pyrolysis of dielectric fluids. The potential contamination with dioxins and furans was calculated and compared with a 20 ppb guideline that has been used by the Centers for Disease Control for dioxin in subsoil. The results demonstrated that dioxins are formed only under pyrolytic conditions and only from the trichlorobenzenes present in dielectric fluids. Furans are found as impurities in PCB fluids but, as with dioxins, are not formed in significant quantities except during pyrolysis. Fortunately, pyrolytic conditions involving PCB fluids and soil contamination are unlikely; therefore, analyses for dioxin and furan contamination in soils will rarely be needed.

19531 (PNL-7260-HEDR) **Estimation of food consumption: Hanford Environmental Dose Reconstruction Project.** Callaway, J.M. Jr. Pacific Northwest Lab., Richland, WA (United States). Apr 1992. 214p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE92013016. Source: OSTI; NTIS; INIS; GPO Dep.

The research reported in this document was conducted as a part of the Hanford Environmental Dose Reconstruction (HEDR) Project. The objective of the HEDR Project is to estimate the radiation doses that people could have received from operations at the Hanford Site. Information required to estimate these doses includes estimates of the amounts of potentially contaminated foods that individuals in the region consumed during the study period. In that general framework, the objective of the Food Consumption Task was to develop a capability to provide information about the parameters of the distribution(s) of daily food consumption for representative groups in the population for selected years during the study period. This report describes the methods and data used to estimate food consumption and presents the results developed for Phase I of the HEDR Project.

19532 (PNL–7874) **Automatic measurement of water levels within the 300-FF-5 boundary.** Campbell, M.D.; Newcomer, D.R. Pacific Northwest Lab., Richland, WA (United States). Apr 1992. 52p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE92013160. Source: OSTI; NTIS; GPO Dep.

A network of pressure transducers with dataloggers and radio transceivers was designed to monitor water levels in 42 wells within the CERCLA 300-FF-5 boundary in the 300 Area at the Hanford Site. Automatic datalogging, radio retrieval, and computer processing provide hourly measurements that appear precise within ± 0.02 ft at a cost expected to be less than $1 each compared with $9 each for steel-tape measurements made manually. Laboratory and field results both confirm that precision is half of that originally specified. This report is intended as a reference to be used in operating and maintaining the monitoring system. The report includes water-level measurements from the first eight wells monitored.

19533 (PNL–8057) **Calculation of groundwater discharge to the Columbia River in the 100-N Area.** Gilmore, T.J.; Newcomer, D.R.; Wurstner, S.K.; Spane, F.A. Pacific Northwest Lab., Richland, WA (United States). Apr 1992. 53p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE92012618. Source: OSTI; NTIS; GPO Dep.

A computer code called WATDIS (an acronym for water discharge) was developed that, when used with the commercially available software, WATER-VEL™, calculates the volumetric discharge to a specific cross-sectional area of the aquifer. This report describes the development of the WATDIS code and its application. The development of this code is Phase 1 of a two-phased project whose objective is to estimate the amounts of radionuclides reaching the Columbia River through the unconfined aquifer as a result of "natural" conditions.

19534 (PNL–8070) **Applicability of slug interference tests under Hanford Site test conditions: Analytical assessment and field test evaluation.** Spane, F.A. Jr. Pacific Northwest Lab., Richland, WA (United States). Apr 1992. 106p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE92013065. Source: OSTI; NTIS; GPO Dep.

Slug interference testing may be a useful technique for characterizing the hydraulic properties of high conductivity formations where problems associated with disposal of contaminated ground water make pumping tests undesirable. The suitability of the slug interference method for characterizing the unconfined aquifer at the Hanford Site was evaluated in a two-phase investigation. The first phase consisted of an analytical assessment. Slug interference responses were predicted over the range of conditions expected for the aquifer. The effects of partial penetration, delayed-yield and aquifer anisotropy on expected test results were also evaluated and possible analytical corrections are presented. The field test evaluation was conducted at a site with two observation wells and a stress well. Results verified the analytical evaluation and gave reasonable values of hydraulic conductivity and storativity. Test design considerations that optimize the observed response are discussed.

19535 (PNL-8083-HEDR) **Literature and data review for the surface-water pathway: Columbia River and adjacent coastal areas: Hanford Environmental Dose Reconstruction Project.** Walters, W.H.; Dirkes, R.L.; Napier, B.A. Pacific Northwest Lab., Richland, WA (United States). Apr 1992. 219p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE92012169. Source: OSTI; NTIS; INIS; GPO Dep.

As part of the Hanford Environmental Dose Reconstruction Project, Pacific Northwest Laboratory reviewed literature and data on radionuclide concentrations and distribution in the water, sediment, and biota of the Columbia River and adjacent coastal areas. Over 600 documents were reviewed including Hanford reports, reports by offsite agencies, journal articles, and graduate theses. Certain radionuclide concentration data were used in preliminary estimates of individual dose for the 1964–1966 time period. This report summarizes the literature and database review and the results of the preliminary dose estimates.

19536 (PNL-SA-20550) **In situ bioremediation of Hanford groundwater.** Skeen, R.S. (Pacific Northwest Lab., Richland, WA (United States)); Roberson, K.R.; Workman, D.J.; Petersen, J.N.; Shouche, M. Pacific Northwest Lab., Richland, WA (United States). Apr 1992. 28p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. (CONF-9204110–3: 1992 Hazardous Materials Control Research Institute federal environmental restoration conference, Vienna, VA (United States), 15-17 Apr 1992). Order Number DE92012350. Source: OSTI; NTIS; INIS; GPO Dep.

Liquid wastes containing radioactive, hazardous, and regulated chemicals have been generated throughout the 40+ years of operations at the US Department of Energy's (DOE) Hanford Site. Some of these wastes were discharged to the soil column and many of the waste components, including nitrate, carbon tetrachloride (CCl_4), and several radionuclides, have been detected in the Hanford groundwater. Current DOE policy prohibits the disposal of contaminated liquids directly to the environment, and remediation of existing contaminated groundwaters may be required. In situ bioremediation is one technology currently being developed at Hanford to meet the need for cost effective technologies to clean groundwater contaminated with CCl_4, nitrate, and other organic and inorganic contaminants. This paper focuses on the latest results of an on going effort to develop effective in situ remediation strategies through the use of predictive simulations.

19537 (SAND-92-0532C) **Development and validation of a multi-site model for adsorption of metals by mixtures of minerals: 1, Overview and preliminary results.** Siegel, M.D. (Sandia National Labs., Albuquerque, NM (United States)); Tripathi, V.S.; Rao, M.G.; Ward, D.B. Sandia National Labs., Albuquerque, NM (United States). [1992]. 12p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-76DP00789 ;AC05-84OR21400 ;AC05-76OR00033 ;AC06-76RL01830. (CONF-920761–3: 7. water-rock interaction conference, Park City, UT (United States), 9-23 Jul 1992). Order Number DE92009057. Source: OSTI; NTIS; INIS; GPO Dep.

The possibility of formulating and validating a multi-site, multisolute model for prediction of contaminant transport in groundwaters is being evaluated through experiments with simple analog systems. These systems consist of mixtures of well-characterized synthetic and natural materials in which the effects of sorption by ion exchange and amphoteric sites are isolated. Initial results are reported for studies of lead sorption by mixtures of goethite and montmorillonite, and Ni-Sr and Pb-Sr ion exchange by montmorillonite. The results of studies of simple clay-oxide mixtures indicate that the pH-dependent sorption behavior of Ni by mixtures of minerals containing amphoteric sites can be predicted from the properties of the component minerals.

19538 (SKB-TR-91-45) **The implications of soil acidification on the future HLNW repository.: Part 1: The effects of increased weathering, erosion and deforestation.** Nebot, J. (MBT Tecnologia Ambiental, Cerdanyola (Spain)); Bruno, J. Swedish Nuclear Fuel and Waste Management Co., Stockholm (Sweden). Jul 1991. 50p. Order Number DE92506617. Source: OSTI; NTIS (US Sales Only).

We have developed a model for soil acidification and granite weathering and erosion caused by the extended use of fossil fuels. We have explored three different scenarios for depletion of fossil fuel reserves depending on how stringent is the control of the overall fossil fuel cycle. Fossil fuels reserves are expected to last for the next 300 years. Nevertheless, we have extended our calculations up to next forecasted major glaciation period (58,000 years). The results of the calculations can be summarized as follows: - For the best and average scenarios the impact of soil acidification due to fossil fuel burning, lasts only for about 500 years. The overall effect is to increase the net surface lowering (weathering + erosion + denudation) in a few percent (1-2%). - In the worst case scenario, the impact of the fossil fuel combustion on the ecosystem is irreversible. The result being that up to 30% of the expected depth of the repository (500 m) would be eroded by year 60,000. The overall ecological impact of this scenario indicates that the safety of a HLNW repository would be a lesser problem for the southern Sweden ecosystem. 41 refs., 22 figs.

19539 (SKN-51) **Geogas - a carrier or a tracer.** Hermansson, H.P. (Studsvik AB, Nykoeping (Sweden)); Chyssler, J.; Aakerblom, G.; Linden, A. National Board for Spent Nuclear Fuel, Stockholm (Sweden). Oct 1991. 67p. Order Number DE92625797. Source: OSTI; NTIS (US Sales Only); INIS.

This report contains an account and discussion of the results of work published within the area of geogas, with particular emphasis on the conditions which would exist in a Swedish repository for spent nuclear fuel. The following issues are addressed. Is there any evidence/is it probable or improbable that a geogas flow exists? How does the flow move, what does it consists of and at what depth is it released? Is there any evidence/is it probable that matter is transported to the surface by geogas flow? What are the mechanisms that could be involved in the transport of matter by geogas? Does the composition of the gas have any bearing on the ability of the gas to transport matter? Would the gas tend to transport certain elements rather than others? What effect does the surrounding rock have on gas transport? If matter is transported upwards by geogas, is this kind of transport important compared to other means of transport of matter? The conclusion of this report is that all evidence points to the existence of a geogas flow and that nitrogen seems to be the most probable geogas candidate in a Swedish repository environment. It is difficult to estimate how quickly the gas can reach the surface from a depth of 500 m. The extreme values are 30 minutes to several thousand years. It is likely that matter is transported by geogas. Such transport is likely to be selective in a way that would favour the upward transport of colloids and other smaller particles. The most probable mechanisms is transport by ascending gas bubbles in water-filled fractures/cavities. Estimates of times, transport rates and quantities in this report are speculative and uncertain and must be regarded as an initial effort, since little or nothing is known of much of the necessary background data. For this reason, it is impossible to compare the importance of geogas transport of radionuclides from a repository with other transport mechanisms. (65 refs., 4 figs., 6 tabls.).

19540 (SKN-52) **Geogas in crystalline bedrock.** Hermansson, H.P. (Studsvik AB, Nykoeping (Sweden)); Sjoeblom, R.; Aakerblom, G. National Board for Spent Nuclear Fuel, Stockholm (Sweden). Oct 1991. 35p. Order Number DE92623495. Source: OSTI; NTIS (US Sales Only); INIS.

Scientific literature provides conclusive evidence of gas migration through crystalline bedrock and up to the surface. In this paper, a compilation is made of significant observations of geogas. Based on these observations, and on physical and chemical principles, possible models for the behaviour of the gas are analysed and discussed. Thus, at a depth of some tens or hundreds of meters, the partial gas pressure might exceed the hydrostatic pressure, enabling the development of a gas phase. Such gas may form in fissures in the rock of perhaps 0.1 mm width. The gas deposited will attempt to minimize its surface energy. The shape assumed will depend on the geometrical constraints as well as on the specific surface energies between gas and water, gas and rock, and water and rock. For a small bubble, or a bubble of moderate size, these effects can be expected to make the bubble stay in place.

The accumulation of gas into the gas pocket will lead to the exertion of pressure onto the uppermost part of the pocket. At some stage of gas accumulation, this pressure will become sufficient for the gas to penetrate upwards through the fissure. As the gas propagates, the hydrostatic pressure will decrease and the volume of the gas will also increase. Eventually, when the surface is reached, a burst of gas may be observed. Four mechanisms have been identified that may describe how heavy elements can be transported from considerable depths to the surface by means of gas: transport through volatile compounds that dissolve in the gas, transport by elements bonded to complexing agents that are surface active and enrich themselves onto the interface between the water and the gas, flotation (bubbles attaching themselves onto particles and lifting them) and transport by aerosols that may form when gas moves rapidly through a fracture in the rock. Finally, the paper makes some recommendations to geoscientists regarding phenomena that it may be fruitful to utilize. (31 refs., 7 figs.).

19541 (SRP-HP--51) **Savannah River Plant Health Physics Department site survey report for 1951.** Reinig, W.C. Du Pont de Nemours (E.I.) and Co., Aiken, SC (United States). Savannah River Plant. 18 Aug 1952. 25p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC09-89SR18035. Order Number DE92011212. Source: OSTI; NTIS (US Sales Only); GPO Dep.

The Site Survey groups began operating at the Savannah River Plant in June 1951. The initial phase of the survey was concerned with the determination of the quantity of naturally occurring radioisotopes in the environs of the Savannah River Plant. These determinations were scheduled to be completed prior to the time when the quantity of radioactive effluents from the plant became significant. Sampling results are presented.

19542 (STRIPA-TR--91-13) **Improvement of high resolution borehole seismics. Part 1: Development of processing methods for VSP surveys. Part 2: Piezoelectric signal transmitter for seismic measurements.** Cosma, C. (Vibrometric Oy, Helsinki (Finland)); Heikkinen, P.; Pekonen, S. Swedish Nuclear Fuel and Waste Management Co., Stockholm (Sweden). May 1991. 115p. Order Number DE92627869. Source: OSTI; NTIS (US Sales Only); INIS.

The purpose of the high resolution borehole seismics project has been to improve the reliability and resolution of seismic methods in the particular environment of nuclear waste repository sites. The results obtained, especially the data processing and interpretation methods developed, are applicable also to other geophysical methods (e.g. Georadar). The goals of the seismic development project have been: the development of processing and interpretation techniques for mapping fractured zones, and the design and construction of a seismic source complying with the requirements of repository site characterization programs. Because these two aspects of the work are very different in nature, we have structured the report as two self contained parts. Part 1 describes the development of interpretive techniques. We have used for demonstrating the effect of different methods a VSP data set collected at the SCV site during Stage 1 of the project. Five techniques have been studied: FK-filtering, three versions of Tau-p filtering and a new technique that we have developed lately, Image Space filtering. Part 2 refers to the construction of the piezoelectric source. Earlier results obtained over short distances with low energy piezoelectric transmitters let us believe that the same principle could be applied for seismic signal transmitters, if solutions for higher energy and lower frequency output were found. The instrument which we have constructed is a cylindrical unit which can be placed in a borehole and is able to produce a radial strain when excited axially. The minimum borehole diameter is 56 mm. (au).

19543 (STRIPA-TR--91-23) **Preliminary - discrete fracture network modelling of tracer migration experiments at the SCV site.** Dershowitz, W.S. (Golder Associates Inc., Redmond, WA (United States)); Wallmann, P.; Geier, J.E.; Lee, G. Swedish Nuclear Fuel and Waste Management Co., Stockholm (Sweden). Sep 1991. 134p. Order Number DE92627872. Source: OSTI; NTIS (US Sales Only); INIS.

This report describes a numerical modelling study of solute transport within the Site Characterization and Validation (SCV) block at the Stripa site. The study was carried out with the FracMan/MAFIC package, utilizing statistics from stages 3 and 4 of the Stripa phase 3 Site Characterization and Validation project. Simulations were carried out to calibrate fracture solute transport properties against observations in the first stage of saline injection radar experiments. These results were then used to predict the performance of planned tracer experiments, using both particle tracking network solute transport, and pathways analysis approaches. Simulations were also carried out to predict results of the second stage of saline injection radar experiments. (au) (34 refs.).

19544 (UCRL--53779-88) **Hydrology and radionuclide migration program: 1988 progress report.** Marsh, K.V. (comp.). Lawrence Livermore National Lab., CA (United States). Feb 1992. 32p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. Order Number DE92012423. Source: OSTI; NTIS; INIS; GPO Dep.

This report presents results from the Lawrence Livermore National Laboratory's participation in the Hydrology and Radionuclide Migration Program at the Nevada Test Site (NTS) during fiscal year 1988. The report discusses studies at a new well 100 m down the hydrologic gradient from the previous sampling point at the Cheshire site; laboratory investigations of the mineralogical composition of NTS colloids; the strength of colloidal deposits and parameters affecting their formation and release; accelerator mass spectrometric measurements of ^{129}I in water from the Cheshire stie; ^{222}Rn concentrations in water from several pumped wells at the NTS; and a description of a new well (PM3) drilled off the NTS near Area 20. Further studies on groundwater sampled show that both technetium and iodine are quite mobile; both closely track the trend of the decreasing tritium concentration with increasing distance. Antimony and cesium concentrations decrease much more rapidly than tritium, and europium was not detected at all in the new well. Colloidal particles found in water collected from the Cheshire cavity are in size range of 0.050 to 0.003 μm and are dominated by quartz and (Ca, K) feldspars. A new well was drilled on US Air Force land adjacent to the NTS Area 20. Static water level measurements and geochemical data from this well will help to determine the extent to which Pahute Mesa base flow infiltrates Oasis Valley. Preliminary results indicate tritium concentrations in water samples from this well to be in the range of 0.1 to 0.4 pCi/ml as measured under field conditions.

19545 (UCRL-ID--105340) **A scoping study of water table excursions induced by seismic and volcanic events.** Carrigan, C.R. (Lawrence Livermore National Lab., CA (United States)); King, G.C.P.; Barr, G.E. Lawrence Livermore National Lab., CA (United States). Nov 1990. 62p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. Order Number DE92012395. Source: OSTI; NTIS; GPO Dep.

We develop conservative models of water table response to displacements just beneath the water table simulating (1) shallow intrusion of a dike and (2) high level slip on a normal fault locked at the end. For matrix flow, we fine local water table excursions of under 10 m. in cases of isotropic permeability which includes dike inflation of 4 m and fault slips corresponding to earthquakes having a moment magnitude of 7.4. Even for enhancements of vertical permeability up to 10^4:1, excursions did not exceed 15 m which implies that pumping is strongly volume limited. We also present an analysis of upward directed flow in cracks for the case of earthquake induced pore pressure changes. For matrix properties characteristic of the Calico Hills (vitric) formation and a crack distribution bounding the potential flow capacity of published data, we estimate an upper bound of 0.25 cu m. of ground water per m. of fault length as the amount capable of being pumped to a level 250 m. above the normal water table. While the presence of even larger fractures than assumed might carry more ground water to that level an absolute upper limit of less than 50 cu. m. per m. of fault length is available to be pumped assuming a value n=0.46 for the rock porosity. For less porous rocks typical of the Topopah Springs or Tiva Canyon formations ($n \approx 0.10$) the upper limit may be reduced to less than 10 cu. m. per m. of fault length. This upper limit depends only upon strain, the height of pumping above the water table and the formation porosity.

19546 (UCRL-JC--107393) **Atmospheric reactive nitrogen: A model study of natural and anthropogenic sources and the**

role of microbial soil emissions. Dignon, J.; Penner, J.E.; Atherton, C.S.; Walton, J.J. Lawrence Livermore National Lab., CA (United States). Feb 1992. 12p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-911212-1: 7. world conference on the chemistry of the atmosphere: its impact on global changes, Baltimore, MD (United States), 2-6 Dec 1991). Order Number DE92010717. Source: OSTI; NTIS; GPO Dep.

Nitrogen oxides ($NO_x = NO + NO_2$) are primary pollutants which react in the atmosphere to form nitric acid (HNO_3). Nitric acid is a major contributor to acid wet and dry deposition and can also affect the reactive nitrogen nutrients in soil and ocean ecosystems. In addition, NO_x takes part in the photochemical cycle of ozone (O_3). Tropospheric O_3 is important from both an atmospheric and a biological perspective. It acts as a greenhouse gas warming the earth's surface and as a chemical oxidant which can cause injury to humans, plants, and animals. Anthropogenic sources including 22 Tg N from fossil fuel burning and 5-13 Tg N from biomass burning constitute the largest contribution [$Tg=10^{12}g$]. Less is understood abut the natural sources of NO_x and in particular the emissions from microbial activity in soils. Here we present a model calculated, seasonally and spatially resolved (1 × 1 degree), inventory of the annual soil emissions of NO_x from microbial activity from natural vegetation ecosystems. The soil emissions model addresses the emissions of soils from the natural vegetation types. Emissions from soil microbial activity have been shown to be temperature and moisture dependent.

19547 (WHC-EP-0448) **Fiscal year 1991 100 Areas CERCLA ecological investigations.** Sackschewsky, M.R.; Landeen, D.S. Westinghouse Hanford Co., Richland, WA (United States). Apr 1992. 82p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE92012203. Source: OSTI; NTIS; INIS; GPO Dep.

This report discusses the status of the ecological investigations conducted by Westinghouse Hanford Company during Fiscal Year 1991. These ecological investigations provide a basic description of the flora and fauna that inhabit the operable units, emphasizing species that have been given special status under existing state and/or federal laws. The 1991 Westinghouse Hanford Company field investigations have concentrated on the following: (1) bird surveys, (2) mammal and insect surveys, (3) vegetation surveys, and (4) vegetation sampling. Work being conducted as part of the vegetation surveys includes a biological assessment of threatened and endangered plants, which is being prepared as a separate document. Similar ecological investigations will be conducted at 100- N, K, and F operable units in 1992.

19548 (WSRC-MS-90-199X) **Multidisciplinary benefits from biomonitoring studies of cooling reservoirs.** Bowers, J.A.; Gladden, J.B. Westinghouse Savannah River Co., Aiken, SC (United States). [1990]. 8p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC09-89SR18035. (CONF-901101-87: American Nuclear Society (ANS) winter meeting, Washington, DC (United States), 11-16 Nov 1990). Order Number DE92010676. Source: OSTI; NTIS; INIS; GPO Dep.

Therefore, biomonitoring studies of once-through cooling reservoirs for nuclear reactors not only provide field and laboratory information for environmental compliance, but also offer results which benefit lake and reservoir management constructs and limnetic community ecology. Biomonitoring programs have been performed at the Department of Energy's Savannah River Site to provide information fro compliance with Section 316a of the Clean Water Act. On Par Pond and Pond B comprehensive field efforts monitored nutrient chemistry, plankton populations, fisheries, benthic assemblages, and littoral zone biota from 1983 through 1985. A similar effort, begun in 1985 and continuing through 1992, is in progress on L Lake. Results have indicated that nonplanned whole-basin manipulations and the comprehensive intensity of monitoring studies offer new insights into how limnetic communities function.

19549 (WSRC-MS-91-120) **Application of inorganic-contaminated groundwater to surface soils and compliance with toxicity characteristic (TCLP) regulations.** Bergren, C.L. (Westinghouse Savannah River Co., Aiken, SC (United States)); Flora, M.A.; Jackson, J.L.; Hicks, E.M. Westinghouse Savannah River Co., Aiken, SC (United States). [1991]. 21p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC09-89SR18035. Order Number DE92011018. Source: OSTI; NTIS; GPO Dep.

The Westinghouse Savannah River Company (WSRC) is currently implementing a Purged Water Management Program (PWMP) at the Savannah River Site (SRS) near Aiken, South Carolina. A variety of constituents and disposal strategies are being considered. Constituents investigated in the PWMP include radionuclides, organics, and inorganics (As, Ba, Cd, Cr, Pb, Hg, Se, and Ag). One practical disposal alternative is to discharge purged water (all constituents below regulatory levels) to the ground surface near the monitoring well that is being purged. The purpose of this investigation is to determine if long-term application of purged water that contains inorganic constituents (below regulatory levels) to surface soils will result in the accumulation of inorganics such that the soil becomes a hazardous waste according to the Toxicity Characteristic regulations (40 CFR Part 261.24). Two study soils were selected that encompass the range of soils found at the SRS: Lakeland and Orangeburg. Laboratory batch equilibrium studies indicate that the soils, although able to retain a large amount of inorganics, will not exceed Toxicity Characteristic concentrations when subjected to the TCLP. Field studies are underway to confirm this.

19550 (WSRC-RP-89-1324) **Groundwater quality assessment/corrective action feasibility plan: New TNX Seepage Basin.** Nichols, R.L. Westinghouse Savannah River Co., Aiken, SC (United States). 5 Dec 1989. 120p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC09-89SR18035. Order Number DE92013140. Source: OSTI; NTIS; INIS; GPO Dep.

The New TNX Seepage Basin is located across River Road east of the TNX Area at the Savannah River Site. Currently the basin is out of service and is awaiting closure in accordance with the Consent Decree settled under Civil Act No. 1:85-2583. Groundwater monitoring data from the detection monitoring network around the New TNX Seepage Basin was recently analyzed using South Carolina Hazardous Waste Management Regulations R.61-79.264.92 methods to determine if groundwater downgradient of the New TNX Seepage Basin had been impacted. Results from the data analysis indicate that the groundwater has been impacted by inorganic constituents with no associated health risks. The impacts resulting from elevated levels of inorganic constituents, such as Mn, Na, and Total PO_4 in the water table, do not pose a threat to human health and the environment.

19551 (WSRC-TR-90-336) **Technical studies on a composite groundwater sample from F- and H-Area.** Bibler, J.P. Westinghouse Savannah River Co., Aiken, SC (United States). 15 Aug 1990. 19p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC09-89SR18035. Order Number DE92013360. Source: OSTI; NTIS; INIS; GPO Dep.

A composite sample of groundwater from F- and H-Areas was collected by Waste Management Tech and delivered to the Savannah River Laboratory to use in preliminary experiments that would test three remediation technologies under consideration. The three technologies are pH adjustment and filtration, decontamination with a strong acid ion exchange resin, and decontamination with a chelating ion exchange resin.

19552 (Y/WM-108) **Summary report of technology demonstrations on Y-12 mixed waste soils.** Chi, L.; Kimmitt, R.R.; Madden, T.H. Oak Ridge Y-12 Plant, TN (United States). Mar 1992. 32p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. Order Number DE92012105. Source: OSTI; NTIS; GPO Dep.

The three companies contracted to perform the treatability studies on the Y-12 mixed wastes were free to demonstrate any technologies to render the waste non-radioactive and/or non-hazardous. All of these mixed waste studies were performed under the treatability study exclusion for RCRA hazardous wastes outlined in Code of Federal Regulations (CFR) 40 Part 261.4. Also, all wastes were analyzed to contain PCBs levels <50 ppm, and therefore not subject to TSCA regulation. The studies gave Martin Marietta Energy Systems Waste Management (WM) personnel an opportunity to test commercially available technologies on actual waste forms. During 1989 and 1990, three companies carried out technology demonstrations on samples of two types of Y-12 mixed waste: the storm sewer sediment and the oil landfarm soil. The sewer sediment, contaminated from the storm sewers of service buildings, is significantly contaminated with uranium (U), mercury (Hg), and polychlorinated biphenyls (PCBs). The oil landfarm soil, unearthed at a waste oil landfarm, is significantly contaminated with U and PCBs. These soils will be identified hereafter as Hg sediment and PCB soil, respectively. These mixed wastes were tested because of their availability and representative contamination. During 1990, additional testing was performed at the Oak Ridge National Laboratory (ORNL).

19553 (ANL/CP-75636) **Quantification and reduction of the uncertainty in mass balance models by Monte Carlo analysis of prior data.** Lesht, B.M. Argonne National Lab., IL (United States). [1991]. 29p. Sponsored by USDOE, Washington, DC (United States); Environmental Protection Agency, Washington, DC (United States); National Oceanic and Atmospheric Administration, Washington, DC (United States). DOE Contract W-31109-ENG-38. (CONF-920291-1: Approaches to reducing uncertainty in mass balance models for toxics: Lake Ontario study, Buffalo, NY (United States), 3 Feb - 5 mar 1992). Order Number DE92010278. Source: OSTI; NTIS; GPO Dep.

The general objective of this workshop is to investigate and discuss methods by which uncertainties in mass balance models for toxics in the Great Lakes may be reduced. As described by the workshop prospectus, this paper is focused on problems of reducing (and quantifying) uncertainty as they relate to "in situ field observations/system response measurements for the establishment of initial conditions, boundary conditions, calibration/confirmation data sets, and model post-audit data sets." I have taken this description to refer not only to the evaluation of uncertainty in the field observations themselves, but also to the uncertainty associated the analyses of in situ observations as they interact in the overall modeling process. Thus, I will be concerned here with quantification and reduction of uncertainty both (1) as they may be applied to descriptions of the system that is being modeled and (2) as they may be associated with model simulations.

19554 (DOE/ER/60981-2) **Measurements of surface ocean carbon dioxide partial pressure during WOCE: Technical progress report, 1 June 1991-31 May 1992.** Weiss, R.F. Scripps Institution of Oceanography, La Jolla, CA (United States). 25 Feb 1992. 9p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG03-90ER60981. Order Number DE92011856. Source: OSTI; NTIS; GPO Dep.

Progress during the past year of research under "Measurements of Surface Ocean Carbon Dioxide Partial Pressure During WOCE" has been significant. As was described in our previous progress report, the startup phase of this research was severely frustrated by delays in the US WOCE Hydrographic Program (WHP), which in turn were caused by delays in the mid-life refit of the R/V Knorr. As a result the high latitude southeastern Pacific work (WHP lines P19S and P16S) originally scheduled for the 1990 austral summer has still not been carried out. As a substitute, the smaller R/V Thomas Washington was pressed into service during mid-1991 to carry out lower-latitude portions of the WHP P16 and P17 lines - the TUNES Expedition. Because this ship is much smaller than the R/V Knorr, she could not carry a full complement of WHP programs and seagoing personnel and was restricted by her size and the time of year to lower-latitude work. Our original proposal for carbon dioxide measurements was designed to divide the work between legs in which we participated as part of the WHP dissolved CFC program (under separate NSF funding) and legs in which we entrusted the operation of our system to other CFC or carbon dioxide laboratories with expertise in gas chromatography. Since we were not involved in any CFC work on the substituted Washington expedition, and since all the seagoing programs on the Washington were additionally stressed by a shortage of people and space, this placed our carbon dioxide program at an unwelcome disadvantage. The preliminary results for carbon dioxide and nitrous oxide are shown. We are forced to rely on spotty manual observations and station CTD temperatures to reconstruct our equilibrator temperature solubility corrections for portions of that leg. We did not get our usual reliable data return, but the results were surely worth effort, especially for this vast and rarely-visited region of the world oceans.

19555 (DOE/ER/60982-2) **Oceanic CO_2 measurements for the WOCE hydrographic survey in the Pacific Ocean, 1990-1991: Shore based analyses during Legs 1-3: Technical progress report, 1 December 1990-28 January 1992.** Keeling, C.D. Scripps Institution of Oceanography, La Jolla, CA (United States). [1992]. 10p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG03-90ER60982. Order Number DE92013064. Source: OSTI; NTIS; GPO Dep.

During the winter and spring of 1991 we made preparations for sampling on three legs of the US World Ocean Circulation Experiment in the Pacific Ocean. These transects, postponed from an original start date early in 1991, took place between May 31 to October 1. For the project, 1400 0.5 liter Pyrex sampling bottles were used for the collection of sea water. A second major pre-expedition task was the construction of a dual titration cell system of new design, as described in the original proposal and our previous semi-annual report.

19556 (DOE-HMIP-RR-91.059) **Factual biosphere database for Dounreay and the surrounding area.** Broderick, M.A. (ANS Consultants Ltd., Epsom (United Kingdom)). Department of the Environment, London (United Kingdom). Her Majesty's Inspectorate of Pollution. Dec 1991. 148p. Contract PECD-7/9/191. (ANS-2595-R28.). Order Number DE92626183. Source: OSTI; NTIS (US Sales Only); INIS.

This report documents from open published sources a factual database appropriate to the Dounreay region including the coastal marine environment for present day biosphere conditions. A detailed description of the present day environment in the Dounreay area is provided. This includes a description of the natural environment and climate. Site specific data required for biosphere modelling are also outlined. (author).

19557 (IG-91/01) **The tritium content of precipitation and surface water in Austria in 1990.** Rank, D.; Rajner, V.; Lust, G. Bundesversuchs- und Forschungsanstalt Arsenal, Vienna (Austria). 1991. 35p. (In German). Order Number DE92625829. Source: OSTI; NTIS (US Sales Only); INIS.

This report includes weighted monthly ^{3}H-means for 23 precipitation sampling stations, ^{3}H-concentrations of daily precipitation samples from the station Wien-Arsenal, and ^{3}H-concentrations of monthly samples from 17 surface water sampling stations. (authors).

EFP-88.

The objective of the project was to investigate the effect of long term exposure to low concentrations of trace elements leaching from a nearshore reclamation site containing fly ash from coal fired power plants codisposed with fly ash and bottom ash from municipal incinerators on single species and multispecies systems of organisms. Populations of mussels, eelgrass, zoobenthos in sediment cores and test panels were exposed in a flow through system with natural sea water (9 0/00 salinity) and 6 dilutions of water from a fly ash lagoon (ranging from 2-1000 times). During exposure periods of 30 weeks, respectively 2 weeks for mussels and eelgrass, there was a direct relationship between the water concentration and the accumulation of cadmium, but this was not the case for chromium. The growth of mussels, eelgrass and the qualitative and quantitative development of the macrozoobenthos in the sediment cores was not related to the concentration of trace elements tested. The conclusions are supported by results of field monitoring of mussels and macrofauna inside and outside a fly ash lagoon. On the basis of the project and results of the ongoing monitoring in the field it is concluded that disposal in a nearshore reclamation site may increase the concentration of trace elements in organisms in the environment, but leaching of trace elements in low levels have no measureable effect on the growth and survival of the biota. Biomonitoring is necessary for detecting trace elements at low levels. Mussels and eelgrass are suitable organisms for long term (month) respectively short term (weeks) monitoring. (au) 24 refs.

19559 (NEI-SE--94) **On the carbonate systems in the Baltic and Weddell Seas: inventories and influences by man.** Ohlson, Mats. Goeteborg Univ. and Chalmers Univ. of Technology (Sweden). Dept. of Analytical and Marine Chemistry. Sep 1991. 32p. Order Number DE92506616. Source: OSTI; NTIS (US Sales Only).

The result of recent measurements of the total alkalinity and calcium in the Baltic Sea are presented. The 1986 investigation gives a significantly different calcium to total alkalinity ratio (0.691) compared to literature values (0.41). Explanations for the difference in calcium to total alkalinity ratio are offered, based on reactions in the drainage basins including decay of organic matter, precipitation of acid rain and dissolution of carbonate minerals. From later investigations a more reasonable explanation seems that the shift is due to chemical patchiness in the Baltic proper. In spite of the acidic precipitation and the increased partial pressure of carbon dioxide in the atmosphere it seems that the carbonate system has not changed dramatically during the century. Existing fluctuations are mainly depending on the season and the inflow of dense water from the Kattegat/North Sea. A carbonate model has been coupled to a one-dimensional physical and biogeochemical model of the Baltic proper. The considered regulating mechanisms have been the atmospheric carbon dioxide pressure, the river run-off concentration of total alkalinity and total carbonate, and the total alkalinity in the precipitation. With the present concentrations of the above regulating mechanisms the uptake of atmospheric carbon dioxide by the Baltic proper gets about 12 g C/m^2/year and the net sedimentation gets about 8 g C/m^2/year. Total carbonate dat from the southern Weddell Sea, collected during the Swedish Antarctic Expedition in 1988-1989, have been investigated with respect to the contribution of anthropogenic carbon dioxide. The anthropogenic carbon dioxide mean concentration varies in the different water masses from about 36 μmol/kg in the Ice Shelf water to 8 μmol/kg in the Antarctic bottom water. The evaluated annual transport of anthropogenic carbon amounts to 8x10^{12} g for this special area. 28 refs., 8 figs.

19560 (NUTEK--89-4705) **Modelling system for simulating the transport of oil and chemical spills in the sea.** Svensson, J. (SMHI, Oceanografiska laboratoriet, Goeteborg (Sweden)); Carlberg, S. NUTEK - Swedish National Board for Industrial and Technical Development, Stockholm (Sweden). 24 Jul 1991. 34p. (In Swedish). Order Number DE92506603. Source: OSTI; NTIS (US Sales Only); INIS.

The building, functioning and benefit of an easy-to-use simulation and forecasting system are described. The user cam simulate the transport of an oil or chemical spill by the wind and currents in order to plan sanitation and containment actions.

19561 (SKB-TR--91-40) **Interaction between geosphere and biosphere in lake sediments.** Sundblad, B. (Studsvik AB, Nykoeping (Sweden)); Puigdomenech, I.; Mathiasson, L. Swedish Nuclear Fuel and Waste Management Co., Stockholm (Sweden). 18 Dec 1990. 111p. Order Number DE92627907. Source: OSTI; NTIS (US Sales Only); INIS.

One main issue in the safety assessment of nuclear repositories, in which processes influence the distribution pattern of radionuclide elements in the biopshere when released radioactivity is carried with groundwater that penetrates through the bottom sediment of a lake. To be able to evaluate the transport of elements such as thorium, uranium, and rare earth elements (REE), sampling of lake sediment cores at different Swedish sites with different degrees of groundwater leakage was performed. Different lake sediment fractions have been identified. One fraction is related to aluminosilicates (clay and sand contents), while the other major fraction contains organic material. Enrichment of uranium is observed in areas of groundwater seepage, and U-contents is correlated to the levels of organic matter. Besides a higher mobility and enrichment of uranium compared to thorium is observed. Chondrite normalised REE sediment contents have been found higher in the most reducing sediments. The weathering and deposition processes are discussed in connection with the degree of mobility of elements. Elements as titanium, zirconium and hafnium are nearly insoluble in aqueous solutions. The immobility of these elements have been confirmed by this study. Hafnium is selected to study the differentiation of the sediment fraction originating from refractory and other physically weathered minerals. (au) (33 refs., 45 figs., 30 tbls.).

19562 (SP--91-35) **Regulations for P-marking of liming products for acidified lakes and watercourses.** Schouenborg, B. Swedish National Testing and Research Inst., Boraas (Sweden). 1991. 26p. Order Number DE92506619. Source: OSTI; NTIS (US Sales Only).

Manufacturers may, after obtaining a permit from the Swedish National Testing and Research Institute (SP), use the P-symbol to mark their products. In order to obtain a marking permit, it must be verified that the product complies with the requirements contained in a standard recognized by SP, or an equivalent normative document. An agreement must also be entered into between SP and the manufacturer concerning continuous quality inspection of the product. This report describes the requirements for P-marking of liming products for acidified lakes and watercourses. The emphasis is on functional and safety requirements including neutralizing effect, grain size distribution, moisture content and heavy metal content. The continuous in-process quality inspection is performed by the manufacturer (self inspection). The manufacturer's inspection is supervised through inspections by SP. These inspections are carried out in the plants at locations for import. The main aim of the quality inspection is to ensure that the requirements placed on the liming products are fulfilled.

19563 (UCRL-ID--104916) **Estimates of the radiological dose to people living on Bikini Island for two weeks while diving in and around the sunken ships in Bikini Lagoon.** Robison, W.L. Lawrence Livermore National Lab., CA (United States). Sep 1990. 10p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. Order Number DE92011590. Source: OSTI; NTIS; INIS; GPO Dep.

Bikini Island and Bikini Lagoon were contaminated by fallout from nuclear weapons tests conducted at the atoll by the United States from 1946 to 1958. The second test, Baker, of the Crossroads series was an underwater detonation in 1946 that sank several ships in the lagoon, including the USS Saratoga and the Japanese battleship Nagato. The ships received high-intensity gamma-ray and neutron bombardment from the Baker test, which induced radioactivity in the metal structures. Some of the tests conducted after the Baker shot (there were 21 tests in all) injected contaminated carbonate particles into the air, some of which were deposited across the lagoon surface. Most of this contaminated soil then settled onto the ships' decks and other structures and on the lagoon bottom. These sunken ships provide an interesting location for divers. Recreational diving and swimming in and around the ships raises the question of the potential radiological dose from the radionuclides present in or on the ships and in the lagoon sediments. The purpose of this paper, therefore, is to present an analysis of the potential radiological dose to persons who would dive near the sunken ships and live on Bikini Island for a short period of time.

19564 (VTT-PUB--81) **Model studies of the transfer of radionuclides in the Finnish environment.** Korhonen, R. (Technical Research Centre of Finland, Espoo (Finland). Nuclear Engineering Lab.). Valtion Teknillinen Tutkimuskeskus, Espoo (Finland). 1991. 116p. Order Number DE92627908. Source: OSTI; NTIS (US Sales Only); INIS.

Environmental modelling of the effects of radionuclide releases was studied. A computer model DETI2A was developed for evaluation of radionuclide transfer. The flexible structure of the model made it suitable for a wide range of applications. The model was employed to evaluate the biospheric transfer of radionuclides in two situations: 1) release cases from planned waste repositories in Finland, and 2) deposition due to the Chernobyl accident. The

Chernobyl accident provided a good opportunity to test the DETRA model, originally constructed for waste disposal applications. A study was made of some biospheric local, regional and global scale scenarios, to which releases from repositories were assumed. Drinking water from a local well and consumption of fish were the most important dose pathways. The transfer of the Chernobyl deposition in some important Finnish transfer environments was evaluated. Especially the transfer of Cs-137 in the Kymijoki watercourse, including dynamic transfer to non-predatory and predatory fish species was studied. The calculated behaviour was compared with the measured behaviour. Nuclear weapon testing fallout was also considered in the comparison studies. On the basis of validation studies it was concluded that part of the Cs-137 deposition was in insoluble form. These model assumptions give that deposition consisting of soluble Cs-l37 could cause fourfold contamination of fish per unit deposition than deposition due to the Chernobyl accident in the modelled case. Model validation was also performed within international projects, in particular by participating in the BIOMOVS project. This participation will be continued in the VAMP program. In the summary part of the thesis the main attention is paid to modelling questions, whereas in the accompanying publications the results are presented in greater detail.

19565 (WHC-SA-1378) **Determining wind spray release from effluent disposal ponds using AIRSOURC Model.** Roblyer, S.P. (Westinghouse Hanford Co., Richland, WA (United States)); Owczarski, P.C. Westinghouse Hanford Co., Richland, WA (United States). Feb 1992. 6p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. (CONF-920328-1: 9. annual hazardous materials conference, Long Beach, CA (United States), 31 Mar - 2 apr 1992). Order Number DE92011333. Source: OSTI; NTIS; GPO Dep.

Two types of mechanisms cause release of materials from open ponds. These mechanisms are mass transfer of volatile materials and aerosol releases resulting from wind-driven sprays. The volatile releases are not the subject of this paper. However, the approach to estimating aerosol formation was unique and involved development from empirical formulas representing ocean sprays. The result of this development was the SPRAYMASS model. SPRAYMASS is a subroutine of AIRSOURC, which estimates airborne releases of chemical and radiological materials. The loss of material from open ponds experiencing strong winds is difficult both to measure and to estimate. The intent of this paper is to provide an approach to a model for estimating the formation rate of aerosols from a pond large enough to experience wind-driven sprays.

19566 (WSRC-RP-91-242) **Levels of radioactivity in fish from streams near F-Area and H-Area seepage basins.** Murphy, C.E. Jr.; Loehle, C. Westinghouse Savannah River Co., Aiken, SC (United States). May 1991. 15p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC09-89SR18035. Order Number DE92009829. Source: OSTI; NTIS; INIS; GPO Dep.

This report summarizes results of recent analyses of radioactivity in fish from SRS streams near the F-Area and H-Area seepage basins. Fish were collected from headwater areas of Four Mile Creek and Pen Branch, from just below the H-Area seepage basin, and from three sites downstream in Four Mile Creek. These fish were analyzed for gross alpha and gross beta radioactivity using standard EPA methods. Levels of gross alpha and nonvolatile beta radioactivity in fish were found to be comparable to levels previously reported for these sites. Gross alpha activity was not found to be influenced by Separations Area discharges. Nonvolatile beta activity was higher in the nonvolatile beta activity was attributable to Cs-137 and K-40. The dosimetric consequences of consuming fish from this area were found to be well below DOE guidelines.

19567 (EGG-10617-2130) **Coyote control to protect endangered San Joaquin kit foxes at the Naval Petroleum Reserves, California.** Cypher, B.L.; Scrivner, J.H. EG and G Energy Measurements, Inc., Tupman, CA (United States). [1992]. 32p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC08-88NV10617. (CONF-9203109-1: 15. vertebrate pest conference, Newport, CA (United States), 5 Mar 1992). Order Number DE92010485. Source: OSTI; NTIS; GPO Dep.

Coyote (Canis latrans) predation is the primary cause of mortality for endangered San Joaquin kit foxes (Vulpes macrotis mutica) at the Naval Petroleum Reserves in California (NPRC). Between 1980 and 1985, the kit fox population on NPRC declined approximately 66% while an increase in coyote abundance was noted. From 1985 to 1990, the US Department of Energy (DOE) sponsored a program to kill coyotes with the objective being to reduce predation on kit foxes and increase fox numbers. During the 5-year effort, 591 coyotes were killed by trapping, shooting, denning, and aerial gunning. Although scent-station indices indicated that coyote abundance declined during the period of control, the contribution of the control effort to this decline is unclear. Kit fox capture indices did not increase after control was initiated. Also, fox survival rates did not increase. The number of coyotes removed annually may not have been sufficient to effectively reduce coyote abundance. Food availability probably was the primary factor influencing the population dynamics of both predators. Control efforts have been deferred pending further consideration of the merits of control and its potential efficacy at NPRC.

19568 (CONF-8910482-1) **Imaging of DNA sequences with chemiluminescence.** Tizard, R. (Biogen, Inc., Cambridge, MA (United States)); Cate, R.L.; Ramachandran, K.L.; Wysk, M.; Bronstein, I.; Voyta, J.C.; Murphy, O.J. Tropix, Inc., Bedford, MA (United States). [1989]. 13p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-89ER80752. From Human genome I: international conference on the status and future of research on the human genome; San Diego, CA (United States); 2-4 Oct 1989. Order Number DE92011906. Source: OSTI; NTIS; GPO Dep.

We have coupled a chemiluminescent method for detecting oligonucleotides labeled with alkaline phosphatase to the genomic DNA sequencing protocol of Church and Gilbert. Images of sequence ladders obtained on x-ray film in a 30 minute exposure are comparable to those from a 40 hour exposure with 3000 Ci/mmol ^{32}P probes. Chemically cleaved DNA from a sequencing gel is transferred to a nylon membrane, and specific sequence ladders are selected by hybridization to an oligonucleotide probe conjugated either to biotin or to alkaline phosphates. If biotinylated probe is used, then an avidin-alkaline phosphatase conjugate is subsequently bound. This membrane, bearing immobilized alkaline phosphatase, is incubated with the commercially available chemiluminescent substrate disodium 3-(4-methoxyspiro[1,2-dioxetone-3,2′-tricyclo[3.3.1.1.^{3,7}]decan]-4-yl)phenyl phosphate. (AMPPD) Dephosphorylation of AMPPD leads in a two step pathway to a highly localized emission of visible light.

19569 (DOE/ER/14004-3) **The molecular characterization of the lignin-forming peroxidase: Progress summary report, April 1, 1989–March 31, 1992.** Lagrimini, L.M. Ohio State Univ., Columbus, OH (United States). Dept. of Horticulture. [1992]. 6p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG02-89ER14004. Order Number DE92010795. Source: OSTI; NTIS; GPO Dep.

This laboratory is committed to understanding the function of plant peroxidases via a multi-disciplinary approach. We have chosen the lignin-forming peroxidase from tobacco as the first isoenzyme to be subjected to this comprehensive approach. The goals which were set out upon the initiation of this project were as follows: (1) utilize a cDNA clone to the tobacco anionic peroxidase to generate transgenic plants which either over-produced this isoenzyme or specifically under-produced this isoenzyme via antisense RNA, (2) describe any phenotypic changes resulting from altered peroxidase expression, (3) perform morphological, physiological, and biochemical analysis of the above mentioned plants to help in determining the in planta function for this enzyme, and (4) clone and characterize the gene for the tobacco anionic peroxidase. A summary of progress thus far which includes both published and unpublished work will be presented in three sections: generation and characterization of transgenic plants, description of phenotypes, and biochemical and physiological analysis of peroxidase function, and cloning and characterization of the tobacco anionic peroxidase gene.

19570 (DOE/ER/20006–1) **Characterization of a 1,4-β-D-glucan synthase from Dictyostelium discoideum: Progress report, May 1990–January 1992.** Blanton, R.L. Texas Tech Univ., Lubbock, TX (United States). Dept. of Biological Sciences. 15 Jan 1992. 8p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG05-90ER20006. Order Number DE92011937. Source: OSTI; NTIS; GPO Dep.

Various aspects of research concerning Dictyostelium discoideum are presented. The initial focus of this project was upon: the characterization of potential probes for the cellulose synthase (antibody and nucleic acid), the determination of the cultural induction conditions of cellulose synthesis, the solubilization of the enzyme activity, the development of a non-inhibitory disruption buffer, the generation and isolation of mutant strains deficient in cellulose synthesis, and the development of the capability to determine the degree of polymerization of the in vitro product. I have briefly summarized our most significant findings with only selected data sets being shown in this report in the interest of brevity.

19571 (DOE/ER/60673–T3) **Neutron scatter studies of chromatin structure related to functions: Progress report, July 1, 1988–June 30, 1989.** Bradbury, E.M. California Univ., Davis, CA (United States). [1989]. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG03-88ER60673. Order Number DE92011630. Source: OSTI; NTIS; INIS; GPO Dep.

Neutron scatter studies have been performed at LANSCE, LANL and at the Institute Laue Langevin, Grenoble, France. In the previous progress report (April 1, 1988–July 1, 1988) the following objectives were listed: shape of the histone octamer; location of the N-terminal domains of histone in the nucleosome core particle (specific aim 1 of original grant proposal); effect of acetylation on nucleosome structure (specific aim 2); location of the globular domain of histone H1 (specific aim 6); and complexes of the transcription factor 3A with its DNA binding site. Progress is briefly discussed.

5504 Genetics

Refer also to citation(s) 19569, 19576, 19873

19572 (DOE/ER/13539–3) **Organization of the R chromosome region in maize: [Progress report].** Kermicle, J. Wisconsin Univ., Madison, WI (United States). Lab. of Genetics. Mar 1992. 3p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG02-86ER13539. Order Number DE92010791. Source: OSTI; NTIS; GPO Dep.

The maize R gene is said to show more phenotypic variation than any other locus in higher plants. The locus is organized on a modular basis. Individual units – termed "genic elements" since they function as independent genes – differ by regulating the presence, intensity and timing of anthocyanin pigmentation in different plant parts. A given allele may comprise only one genic element or, more commonly, an allele comprises a complex of elements, organized as a small gene family. Different numbers and combinations of even a few genic elements gives a large number of possible complexes. Following molecular cloning of R we concentrated effort initially on a genic element that confers strong pigmentation only to the kernel. The functional limits of this gene (R-sc:124) had been defined genetically by extensive mutagenesis with the transposable element Dissociation. Subsequently, a set of contiguous probes were prepared from a genomic clone of R-sc:124. This set of probes distinguishes among various R-genic elements, providing physical evidence on gene complexes whose overall organization had been determined genetically. Some surprises were in store, as detailed below. These same tools made it possible to analyze the effect of position of Ds insertion within R-sc:124 on spotting phenotype, germinal reversion rate and frequency of Ds excision. Furthermore, we are now able to address in much more detail some of the unique phenomena of R action, such as a difference in kernel phenotype when certain alleles are transmitted by ovules relative to sperm. The last category of objectives is discussed in the section entitled "updated research plan."

19573 (DOE/ER/13705–T2) **Characterization and expression of Clostridium cellulase genes: Progress report, May 1, 1987–April 30, 1989.** Doi, R.H. California Univ., Davis, CA (United States). Dept. of Biochemistry and Biophysics. [1989]. 11p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG03-87ER13705. Order Number DE92012231. Source: OSTI; NTIS; GPO Dep.

Progress is described on the characterization of cellulase genes of Clostridium. Purification, enzyme activity, molecular weight, and antibody development is discussed.

19574 (DOE/ER/20003–1) **Genetic studies on cytoplasmic male sterility in maize: Progress report, April 15, 1990–April 14, 1992.** Laughnan, J.R. Illinois Univ., Urbana, IL (United States). Dept. of Plant Biology. [1992]. 10p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG02-90ER20003. Order Number DE92012316. Source: OSTI; NTIS; GPO Dep.

Our research concerns the basic mechanisms of cytoplasmic male sterility (CMS) and fertility restoration in maize. The molecular determination of CMS is in the DNA of the mitochondria (mtDNA) but specific nuclear restorer-of-fertility (Rf) genes can overrule the male-sterile effect of the cytoplasm. Our approach to the study of the Rf genes is threefold. We are attempting to tag the cms-S Rf genes and the cms-T Rf2 gene with controlling elements (CEs). Since we have identified a number of spontaneous Rf genes for cms-S and have demonstrated that they are themselves transposable, we are also searching for cases in which an Rf gene is inserted into a wild-type gene. The other aspect of our research involves the nuclear control over the organization of the mitochondrial genome. We found that the changes in mtDNA organization upon cytoplasmic reversion to fertility were characteristic of the nuclear background in which the reversion event occurred. We have investigated whether these differences are a reflection of differences in the organization of the mtDNA genome before reversion.

19575 (DOE/ER/61136–1) **An improved method for producing radiation hybrids applied to human chromosome 19: Technical progress report, March 1, 1991–February 28, 1992.** Jackson, C.L. Rhode Island Hospital, Providence, RI (United States). [1992]. 4p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG02-91ER61136. Order Number DE92011030. Source: OSTI; NTIS; GPO Dep.

At the initiation of the grant we had just produced radiation hybrids from a monochromosomal microcell hybrid containing human chromosome 19 as its only human component. Radiation hybrids were produced using doses of radiation ranging from 1000–8000 rads. Lethally irradiated cells were then fused to hamster recipients (CHTG49) and selected for growth in histidinol. Approximately 240 clones were isolated and 75 clones were expanded for the isolation of DNA. This report describes in situ hybridization studies and the introduction of markers into human chromosome 19.

Sponsored by USDOE, Washington, DC (United States). DOE Contract FG02-87ER13707. Order Number DE92012123. Source: OSTI; NTIS; GPO Dep.

Two genes involved in the regulation of nitrogenase activity, draT and draG, were cloned and found to be contiguous on the Azospirillum brasilense chromosome. The nifH gene, encoding dinitrogenase reductase, is near to draT with an intervening gap of 1.9

kb. The organization of these genes in Azospirillum lipoferum and Rhodosprillum rubrum is similar, but nifH and draT are separated by only 400 bp in the organisms. A. brasilense draTG is very similar to draTG in R. rubrum with 91.8% similarity and 85.3% identity at the amino acid level. Apparently A. brasilense uses the normal ATG initiation codon for draT, and draG. The genes for A. brasilense were able to restore function to appropriate mutants of R. rubrum. The heterologous expression of A. brasilense draTG in R. rubrum was not fully normal, as it responded more slowly to darkness and more quickly to ammonia than wild type cells. Our mutational analysis of the draTG region of A. brasilense confirms the function of these genes in the regulation of nitrogenase activity, but it also revealed minor but demonstrable differences in the control systems of R. rubrum and A. brasilense.

19577 (LBL–31592) **Nuclear magnetic resonance studies of the regulation of the pentose phosphate pathway.** Bolo, N.R. Lawrence Berkeley Lab., CA (United States). Nov 1991. 144p. Sponsored by USDOE, Washington, DC (United States); Department of Health and Human Services, Washington, DC (United States). DOE Contract AC03-76SF00098. Grant HL07367. Order Number DE92010257. Source: OSTI; NTIS; INIS; GPO Dep.

The goal of this work is to investigate the potential for and limitations of in vivo nuclear magnetic resonance (NMR) spectroscopy for quantitation of glucose flux through the pentose phosphate pathway (shunt). Interest in the shunt is motivated by the possibility that its activity may be greatly increased in cancer and in the pathological states of cardiac and cerebral ischemia. The ability to dynamically monitor flux through the pentose shunt can give new knowledge about metabolism in pathological states. ^{13}C NMR spectroscopy was used to monitor shunt activity by determination of the ratios of [^{13}C-4] to [^{13}C-5]-glutamate, [^{13}C-3] to [^{13}C-2]-alanine or [^{13}C-3] to [^{13}C-2]-lactate produced when [^{13}C-2]-glucose is infused. These methods provide measures of the effect of oxidative stresses on shunt activity in systems ranging from cell free enzyme-substrate preparations to cell suspensions and whole animals. In anaerobic cell free preparations, the fraction of glucose flux through the shunt was monitored with a time resolution of 3 minutes. This work predicts the potential for in vivo human studies of pentose phosphate pathway activity based on the mathematical simulation of the ^{13}C fractional enrichments of C4 and C5-glutamate as a function of shunt activity and on the signal-to- noise ratio acquired in ^{13}C NMR human studies from the current literature.

19578 (BNL–47087) **Neutron capture therapy: Years of experimentation—Years of reflection.** Farr, L.E. Brookhaven National Lab., Upton, NY (United States). 16 Dec 1991. 29p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH00016. Order Number DE92011552. Source: OSTI; NTIS; INIS; GPO Dep.

This report describes early research on neutron capture therapy over a number of years, beginning in 1950, speaking briefly of patient treatments but dwelling mostly on interpretations of our animal experiments. This work carried out over eighteen years, beginning over forty years ago. Yet, it is only fitting to start by relating how neutron capture therapy became part of Brookhaven's Medical Research Center program.

19579 (DGEN-MN–92-3) **Radiolabeling of human platelets using four radiopharmaceuticals with Tc-99m.** Portillo L, M.C. (Unidad de Medicina Nuclear de la Direccion General de Energia Nuclear, Guatemala City (Guatemala)); Godoy, C. Direccion General de Energia Nuclear, Guatemala City (Guatemala); Hospital General San Juan de Dios, Guatemala City (Guatemala). 1991. 7p. (In Spanish). Order Number DE92626566. Source: OSTI; NTIS (US Sales Only); INIS.

The present investigation work has been done in an evaluation of four different radiopharmaceuticals with Tin II (Glucoheptonate, Pyrophosphate, Citrate and DTPA), with the purpose of determining which one of the four would be obtained a higher rate of radiolabeling of platelets with Tc-99m. In order to evaluate the four radiopharmaceuticals it was procede to the separation and labeling of the human platelets. It was worked with samples of blood from five pacients, and the platelets from each one of them were labeled with the radiopharmaceuticals-Tc-99m. Then was observed a significant difference among the four radiopharmaceuticals studied, with a reliable level of 0.05 being the Glucoheptonate-Tc-99m the best to label platelets, obtaining with the same 50.23% of labeling efficiency, while for DTPA, Pyrophosphate and Citrate, It was obtained 33.42%, 29.82% and —2.62% respectively. Also, it was studied the biodistribution of the labeled platelets, using Glucoheptonate-Tc-99m as a radiopharamceutical. The biodistribution was studied in white mice at different times and it was founded that the place of biodistribution of the labeled platelets is given in greater percentage in the liver, spleen, lungs and kydneis. (Author).

19580 (DOE/ER/60219–T2) **[Radiopharmacokinetics: Utilization of nuclear medicine]: Comprehensive progress report, [1986–1989].** Wolf, W. University of Southern California, Los Angeles, CA (United States). [1989]. 29p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG03-84ER60219. Order Number DE92013154. Source: OSTI; NTIS; INIS; GPO Dep.

The work performed in the 1986/1989 period can be characterized as one of testing and documenting that the Radiopharmacokinetic technique is both feasible and applicable to human studies, as well as developing spectroscopic methods for undertaking noninvasive human studies. Main accomplishments include studies which: show that drug targeting can be monitored noninvasively using radiolabeled drugs. The study that documented this finding involved an analysis of the comparative kinetics of biodistribution of ^{195m}Pt-cisplatin to brain tumors, when administered intravenously and intra-arterially; show that such differential targeting of Platinum represents a differential quantity of drug and a differential amount of the active component reaching the target site; show that in vivo NMRS studies of drugs are possible, as documented by our studies of 5-fluorouracil; show that 5-fluorouracil can be trapped in tumors, and that such trapping may be directly correlatable to patient response; show that the radiopharmacokinetic technique can also be used effectively for the study of radiopharmaceuticals used for imaging, as documented in our studies with ^{99m}T$_c$-DMSA.

19581 (DOE/ER/60719–T1) **Improved radioimmunotherapy of hematologic malignancies: [Final report].** Press, O.W. Washington Univ., Seattle, WA (United States). 24 Mar 1992. 21p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG06-88ER60719. Order Number DE92012504. Source: OSTI; NTIS; INIS; GPO Dep.

This research project proposes to develop novel new approaches of improving the radioimmunodetection and radioimmunotherapy of malignancies by augmenting retention of radioimmunoconjugates by tumor cells. The approaches shown to be effective in these laboratory experiments will subsequently be incorporated into out ongoing clinical trials in patients. Specific project objectives include: to study the rates of endocytosis, intracellular routing, and metabolic degradation of radiolabeled monoclonal antibodies targeting tumor-associated antigens on human leukemia and lymphoma cells; To examine the effects of lysosomotropic amines (e.g. chloroquine, amantadine), carboxylic ionophores (monensin, nigericin), and thioamides (propylthiouracil), on the retention of radiolabeled MoAbs by tumor cells; to examine the impact of newer radioiodination techniques (tyramine cellobiose, paraiodobenzoyl) on the metabolic degradation of radioiodinated antibodies; to compare the endocytosis, intracellular routing, and degradation of radioimmunoconjugates prepared with different radionuclides (^{131}Iodine, ^{111}Indium, ^{90}Yttrium, ^{99m}Technetium, ^{186}Rhenium); and to examine the utility of radioimmunoconjugates targeting oncogene products for the radioimmunotherapy and radioimmunoscintigraphy of cancer.

19806 (INIS-GB-428) **Medical radiation.** At-a-Glance series. National Radiological Protection Board, Chilton (United Kingdom). [1992] 6p. Order Number DE92628097. Source: OSTI; NTIS (US Sales Only); INIS.

Folded leaflet.

This leaflet in the At-a-Glance Series describes the medical use of X-rays, how X-rays help in diagnosis, radiation protection of the patient, staff protection, how radioactive materials in nuclear medicine examinations help in diagnosis and the use of radiation in radiotherapy. Magnetic resonance imaging, a diagnostic technique involving no ionizing radiation, is also briefly examined. The role of the NRPB in the medical use of radiation is outlined. (UK).

Source: OSTI; NTIS (US Sales Only); INIS.

Medical and health physics are covered by the papers and posters presented at this congress. A third group within the Association, the group of Radiobiological Scientists, was expected to be formed during this congress. 67 articles have been indexed (44 papers and 23 poster presentations), and 8 articles have been considered to be out of scope for INIS.

19816 (INIS-mf–13196) **Chest X-ray : a cost-diagnostic benefit analysis: Conventional versus 100 mm image Intensifier Radiography.** Winter, L.H.L. Rijksuniversiteit Utrecht (Netherlands). 13 Dec 1991 188p. Order Number DE92628099. Source: OSTI; NTIS (US Sales Only); INIS.

Includes summary in Dutch and List of publications and presentations by the author.

Although plain chest radiography is one of the most useful diagnostic tools available to the physician, this procedure has not evolved into a consistent method. Two Large Field of View Image Intensifiers (LFOV-II) became available; the large imaging area makes them suitable for chest imaging. Both modalities supply 100 mm images to the radiologist. In this thesis the 'diagnostic benefits and 'costs' of these modalities are evaluated and related to the 'gold' standard (conventional full-size). The emphasis is on diagnostic image quality using phantoms for observer performance qualities. (author). 170 refs.; 21 figs.; 47 tabs.

19817 (KURRI-TR–356) **Investigation for the extended application of melanoma Boron Neutron Capture Therapy.** Mishima, Yutaka (Kobe Univ. (Japan). School of Medicine). Kyoto Univ., Kumatori, Osaka (Japan). Research Reactor Inst. Nov 1991. 319p. (In Japanese, English). Order Number DE92514983. Source: OSTI; NTIS (US Sales Only); INIS.

This issue is the Part B of the Progress Report (III) which includes our latest research results focusing mainly on the successful treatment of the first human melanoma patient who had metastasis in the scalp region. We also include the subsequent clinical treatment of various types of human primary melanoma lesions and the additional basic investigations necessary to perform the treatment. (J.P.N.).

19818 (KURRI-TR–357) **Selective thermal neutron capture therapy of malignant melanoma using melanogenesis-seeking ^{10}B-compounds.** Mishima, Yutaka (Kobe Univ. (Japan). School of Medicine). Kyoto Univ., Kumatori, Osaka (Japan). Research Reactor Inst. Nov 1991. 204p. (In Japanese, English). Order Number DE92514984. Source: OSTI; NTIS (US Sales Only); INIS.

19819 (LBL–31457) **Monte Carlo optimization of depth-of-interaction resolution in PET crystals.** DeVol, T.A. (Michigan Univ., Ann Arbor, MI (United States). Dept. of Nuclear Engineering); Moses, W.W.; Derenzo, S.E. Lawrence Berkeley Lab., CA (United States). Nov 1991. 5p. Sponsored by USDOE, Washington, DC (United States); Department of Health and Human Services, Washington, DC (United States); Oak Ridge Associated Universities, Inc., TN (United States); National Cancer Inst., Bethesda, MD (United States). DOE Contract AC03-76SF00098. Grant P01-HL25840;Grant R01-CA48002. (CONF-911106–92: IEEE nuclear science symposium, Santa Fe, NM (United States), 5-9 Nov 1991). Order Number DE92011147. Source: OSTI; NTIS; GPO Dep.

The light distribution along one edge of a PET scintillation crystal was investigated with a Monte Carlo simulation. This position-dependent light can be used to measure the 511 keV photon interaction position in the crystal on an event by event basis, thus reducing radial elongation. The expected full width at half maximum (FWHM) of the light distribution on the 3 x 30 mm^2 surface of a 3 x 10 x 30 mm^3 bismuth germanate (BGO) crystal surrounded by a diffuse reflector was determined to be 3.0 mm. This light distribution does not change as the width (originally 3 mm) is varied from 1 to 6 mm, but decreases monotonically from 3.0 to 1.8 mm FWHM as the height (originally 10 mm) is reduced to 3 mm. Other geometrical modifications were simulated, including numerous corner reflectors on the opposing 3 x 30 mm^2 surface, which reduced the FWHM to 2.4 mm. The response of a dual wedge photodiode combined with the predicted light distribution for the 3 x 10 x 30 mm^3 BGO simulation crystal results in an expected depth of interaction resolution of 7.5 mm FWHM.

19820 (LUMEDW-MEKP–1019-1-104-1991) **Urinary trypsin inhibitor - an experimental and clinical study.** Berling, B.M. Lund Univ., Malmoe (Sweden). Depts. of Surgical Pathophysiology and Anaesthesiology. 1991. 41p. Order Number DE92628116. Source: OSTI; NTIS (US Sales Only); INIS.

The urinary trypsin inhibitor (UTI) is an acid stable proteinase inhibitor present in blood and urine. It was purified from urine using affinity chromatography, ion exchange chromatography and gel filtration. Two forms of UTI were present in urine, A and B. A radioimmunoassay for measurement of UTI in urine and plasma was performed. The normal level of UTI in plasma and serum was about 2 mg/l. The normal excretion in urine was about 8 mg per 24 hours. The plasma and urine levels of UTI were studied in patients with acute pancreatitis and in patients undergoing cholecystectomy. Uremic patients had a marked increase of UTI in plasma compatible with decreased glomerular filtration. In samples from healthy persons as well as from patients only inhibitor A was found. Inhibitor B has recently been renamed bikunin because of its two Kunitz-type inhibiting domains. Inhibitor A might be called tetrakunin. Radioactively labeled UTI (inhibitor A) was injected intravenously in three male volunteers. The plasma half-life of ^{125}I UTI was 2 hours. Free biologically active inhibitor was found in the urine during the first four hours after injection. The organ distribution of intravenously injected ^{125}I UTI was studied in rats. Fifteen minutes after injection the major part of the radioactivity was found in the kidneys, suggesting that the kidneys are the primary site of UTI metabolism. Using immunohistochemical techniques UTI was found in the proximal tubules of the normal human kidney further indicating the tubular reabsorption and methabolisms of UTI.

19821 (NEI-NO–193) **Ultrasonography versus intravenous urography: Value in urological disease.** Aslaksen, A. Bergen Univ. (Norway). 1991 87p. Order Number DE92628100. Source: OSTI; NTIS (US Sales Only); INIS.

Reprints of six previously printed papers are attached.

The present study was performed to compare the clinical value of urography and ultrasonography in a non-selected group of patients referred for urography to a university hospital. The conslusions and clinical implications of the study are as follows: Intravenous urography remains the cornerstone imaging examination in the evaluation of ureteral calculi. Ultrasonography is a valuable adjunct in cases of non- visualization of the kidneys, in distal obstruction and known contrast media allergy. When women with recurrent urinary tract infection are referred for imaging of the urinary tract, ultrasonography should be used. Ultrasonography should replace urography for screening of non-acute hydronephrosis like in female genital cancer and benign prostate hyperplasia. There is good correlation between urography and ultrasonography in assessing the degree of hydronephrosis. However, more researh on the relationship between hydronephrosis and obstruction is necessary. Ultrasonography should be used as the only imaging method of the upper urinary tract in patients with microscopic hematuria. In patients less than 50 years with macroscopic hematuria, ultrasonography should be used as the only imaging of the upper urinary tract, and an examination of the urinary bladder should be included. In patients over 50 years, urography supplied with ultrasonography should be used, but more research is necessary on the subject of imaging method and age. 158 refs.

19822 (NEI-NO–194) **Magnetic iron oxide for contrast-enhanced MR imaging.** Fahlvik, A.K. Oslo Univ. (Norway). May 1991 96p. Order Number DE92628101. Source: OSTI; NTIS (US Sales Only); INIS.

Reprints of six previously printed papers are attached.

The main objective of this experimental work has been to study the biological fate and the contrast enhancing potential of a model preparation of magnetic iron oxide (MSM) after intravenous injection to rodents. This was achieved by: Studying in vitro contrast efficacy of various magnetic iron oxide preparations by relaxation analysis. Studying in vivo contrast efficacy of MSM by relaxation analysis and NMR imaging. Studying the biodistribution and bioelimination of MSM in independent experiments using relaxation analysis, radioactivity studies and histological techniques. Studying interactions of MSM with target cells and target organelles using ex vivo techniques. Based on the presented experimental study, the MSM model preparation of magnetic iron oxide seems to fulfill basic requirements of NMR contrast agents: efficient proton relaxation, specific in vivo distribution, and biological tolerance. 177 refs., 5 figs., 2 tabs.

19823 (ORNL/TM–12054) **Nuclear medicine program progress report for quarter ending December 31, 1991.** Knapp, F.F. Jr.; Ambrose, K.R.; Callahan, A.P.; McPherson, D.W.; Mirzadeh, S.; Srivastava, P.C.; Hasan, A.; Lambert, C.R.; Lambert, S.J.; Rice, D.E. Oak Ridge National Lab., TN (United States). Apr 1992. 17p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. Order Number DE92012619. Source: OSTI; NTIS; GPO Dep.

This report presents information on (1) a new improved synthesis of carrier-free rhenium-188-labeled Re(V) dimercaptosuccinic acid (DMSA) complex as a potential therapeutic agent for treatment of thyroid medullary carcinoma; and (2) the synthesis and evaluation of a series of iodine-125-labeled analogues of altanserine for imaging of serotonin receptors.

19824 (UCRL-ID–110116) **Project implementation plan: Quality assurance for gamma knives: FIN L-1938-1: Revision 3.3.** Lawrence Livermore National Lab., CA (United States). 1 Mar 1992. 252p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. Order Number DE92011591. Source: OSTI; NTIS; GPO Dep.

The gamma knife is a treatment machine used for stereotactic brain irradiation. It is manufactured and marketed by Elekta Instruments. The treatment goal is to deliver a high dose of radiation to a small, discrete volume with minimal radiation to adjacent normal brain tissue. The radiation unit contains 201 cobalt-60 sealed sources distributed in a hemisphere located within the central body of the unit. The beams from each individual source are collimated and converge at a focal point at the center of the radiation unit. The patient's head is positioned in a collimator helmet such that the target volume in the brain corresponds to the beam focal point. At the time of initial loading the total cobalt 60 activity is approximately 5400-6600 curies. Current Nuclear Regulatory Commission (NRC) Regulations address quality control procedures for conventional cobalt-60 teletherapy devices, but do not address comparable procedures for gamma knives. Also reports received by the NRC indicate that there are some cases of teletherapy misadministrations that have resulted from equipment malfunction and from errors in treatment planning and physical measurements. The NRC believes that comparable events may occur with gamma knives. The objectives of this project are: (1) to identify the device review or registration requirements; (2) to identify quality control/calibration procedures for acceptance testing, routine calibration, and spot checks; (3) to identify the equipment service requirements including identification of critical components; (4) to identify the current standards and guidelines that are required for recommended by government and non-government organizations for the review of the associated computerized treatment planning system; and (5) to perform analysis to determine the risk implications of the use of these devices.

19825 (CONF-911202–67) **Quantitative ruthenium method for analysis of nitrogen ion-implanted titanium alloy (Ti-6Al-4V) and the effect on bacterial adherence.** Giammara, B.L. (Louisville Univ., KY (United States)); Birch, D.J.; Dobbins, J.; Williams, J.M. Oak Ridge National Lab., TN (United States); Louisville Univ., KY (United States). [1991]. 10p. Sponsored by USDOE, Washington, DC (United States); National Science Foundation, Washington, DC (United States). DOE Contract AC05-84OR21400. From Annual fall meeting of the Materials Research Society; Boston, MA (United States); 2-6 Dec 1991. Order Number DE92010447. Source: OSTI; NTIS; GPO Dep.

The effects of nitrogen ion implementation of Ti-6Al-4V alloy on growth of Pseudomonas aeruginosa bacteria on surfaces of the alloy have been investigated. Results for ion implanted samples were compared with controls with similarly smoothly polished surfaces and with controls that had intentionally roughened surfaces. The test consisted of exposing sterile alloy samples to a microbiological broth, to which 24-hour-old cultures of Pseudomonas aeruginosa had been added. After bioassociation at normal temperature 37°C, bacteria adhering to the surface were fixed and treated with a new ruthenium tetroxide staining method, and quantified by use of scanning electron microscopy (SEM), back-scattered electron imaging and EDAX energy dispersive microanalysis. For smooth samples of the alloy, after a 12 hour growth period, the retained bacteria (revealed by the biologically incorporated ruthenium), decreased monotonically with nitrogen dose out to a total fluence of approximately $7 \times 10^{17}/cm^2$ in an affected depth of approximately 0.1500 μm. The SEM confirmed that the Pseudomonas aeruginosa adhered equally to control materials. The ruthenium studies revealed that the amount of bacterial adhesion is indirectly proportional to the nitrogen ion implantation of the titanium. The greater the percentage of nitrogen ion implantation in the titanium alloy, the less bacteria colonized the disk.

19826 (NEI-DK–770) **Effects of gaseous air pollutants on the Danish plant community.** Energiministeriets Energiforskningsprogram. Miljoe og restprodukter. Johnsen, I. (Institut for Oekologisk Botanik, Koebenhavns Universitet (DK)); Ro-Poulsen, H.; Soechting, U.; Mortensen, L. Copenhagen Univ. (Denmark). Inst. for Oekologisk Botanik; Copenhagen Univ. (Denmark). Inst. for Sporeplanter; Danmarks Miljoeundersoegelser, Roskilde (Denmark). Afd. for Forureningskilder af Luftforurening. Dec 1991 31p. (In Danish). Contract EM-1323/86-20. Order Number DE92506314. Source: OSTI; NTIS (US Sales Only).

EFP-86.

The purpose of the project was to investigate the importance, for Danish non-agricultural vegetation, of the gaseous air pollutants: Ozone, Sulphur Dioxide and Nitrogen Dioxide. Investigations were based on experiments in open-top chambers, where the climatic conditions are very close to those in the ambient surroundings. The air in the chambers were charcoal filtered, ambient, or added extra amounts of one er more of the three gasses to simulate elevated levels of the occurring variation. In the chamber bottoms the following plants were grown individually: Cladonia portentosa, Lotus corniculatus, Medicago lupulina, Empetrum nigrum, Calluna vulgaris, and finally, Fagus sylvatica, and Pices abies. Reindeer moss did not take up substantial amounts of nitrogen from the air. Fumigation with sulphur dioxide and nitrogen dixode, seems to cause washout of ions from the thallus. Ozone effects was observed, for the first time, on natural Danish herbs and shrubs. Large interspecific sensitivity variation was seen. For M. lupulina and C. vulgaris, the above-ground biomass increment was reduced by 40% and 25%, respectively, by a constant daytime additon of approximately 40 ppb ozone to the ambient concentrations. Neither L. corniculatus or E. nigrum seemed to be affected. P. abies was affected by the same ozone level, which caused disturbances to the growth of shoots and needles. Bud burst and shoot elongation was delayed, and a persistent reduction of needle length was found during two years experiments. F. sylvatica seemed to be very ozone sensitive, showing a marked reduced diameter increment and early senescense. (AB) 31 refs.

19827 (AECL–10048) **A review of the chemical aspects of irradiated shrimp.** Shamsuzzaman, K. Atomic Energy of Canada

Ltd., Pinawa, MB (Canada). Whiteshell Nuclear Research Establishment. Sep 1989. 49p. Order Number DE92626158. Source: OSTI; NTIS (US Sales Only); INIS.

The literature was reviewed for information on the chemical aspects of irradiated shrimp. Low-dose irradiation can effectively control spoilage and pathogenic organisms and extend the refrigerated shelf life of shrimp. Radiation-induced increases in black discoloration occur in some species during storage, but can be minimized by proper blanching. Some loss of the characteristic pink color occurs at doses above 2.5 kGy, and irradiation off-odors occur above 1.5 kGy. These changes can be minimized by irradiating the shrimp when they are frozen. No significant change in protein, fat, carbohydrate, and ash content occurs as a result of low-dose irradiation. Low-dose irradiation does not produce any detectable change in the levels of volatile carbonyl compounds; irradiation at 8 kGy results in a transient increase in the total volatile compounds during subsequent storage in ice, but the increase is higher in the unirradiated shrimp. Radiation-induced changes in the fatty acid composition of shrimp are small. Some minor changes in the amino acid composition occur in irradiated shrimp; similar changes occur due to other processes such as canning and drying in hot air. Some vitamins in shrimp such as thiamine are affected by irradiation. But the loss is less extensive than in thermally processed shrimp. The protein efficiency ratio is not affected by irradiation of shrimp, and no adverse effects attributed to irradiation were found in animal feeding studies.

19828 (AECL–10398) **Surface decontamination of cheddar cheese by electron-beam irradiation.** Shamsuzzaman, K. (Atomic Energy of Canada Ltd., Pinawa, MB (Canada). Whiteshell Nuclear Research Establishment); Blank, G. Atomic Energy of Canada Ltd., Pinawa, MB (Canada). Whiteshell Nuclear Research Establishment. 1991. 19p. Order Number DE92626159. Source: OSTI; NTIS (US Sales Only); INIS.

Cheddar cheese samples inoculated with two different levels of Penicillium cyclopium or Aspergillus ochraceus spores were vacuum-packed and irradiated at various doses up to 3.5 kGy with electrons from a 10-MeV linear accelerator. Unirradiated cheese showed visible mold growth in 8-25 d at 10 degrees C, and 7-12 d at 15 degrees C, depending on species and spore concentration. Only marginal extension of shelf life at 15 degrees C was achieved with cheese inoculated with 10^2 cfu per sample of either of the mold spores, followed by irradiation at 0.21 or 0.52 kGy. However, at these doses the average shelf life at 10 degrees C was extended by 41.5 and 50.5 d respectively when the inoculum was A. ochraceus. When the inoculum level was increased tenfold, irradiation at 1.2 and 3.5 kGy extended the average shelf life of cheese containing P. cyclopium by 44.5 and >262 d respectively at 10 degrees C, and by 3 and >166 d respectively at 15 degrees C. The shelf life of samples containing A. ochraceus and irradiated at 1.2 or 3.5 kGy was extended by at least 255.5 d at 10 degrees C and at least 160 d at 15 degrees C. The results clearly showed that low radiation doses are effective in the mold decontamination of cheese. The results also suggest that P. cyclopium in Cheddar cheese is more radiation-resistant than A. ochraceus. This was supported by determination of radiation survival curves for the two species incorporated into Cheddar cheese: D_{10} values for P. cyclopium and A. ochraceus were found to be 0.40 and 0.21 kGy respectively. The radiation sensitivity of the two organisms was found not to vary with pH in the pH range 5.0-6.2.

19829 (ANL/ESD/TM–25) **Minimal Technologies Application Project: Planning and Installation.** Zellmer, S.D.; Hinchman, R.R.; Severinghaus, W.D.; Johnson, D.O.; Brent, J.J. Argonne National Lab., IL (United States). Energy Systems Div. Mar 1989. 59p. Sponsored by Department of Defense, Washington, DC (United States). DOE Contract W-31109-ENG-38. Order Number DE92012103. Source: OSTI; NTIS; GPO Dep.

Intensive and continuous tactical training during the last 35 years at the Hohenfels Training Area in West Germany has caused the loss of vegetative ground cover and has accelerated soil erosion rates, resulting in extensive environmental damage, safety hazards, and unrealistic training habitats. The objectives of this project are to develop and evaluate revegetation procedures for establishing adequate vegetative cover to control erosion at minimal costs and disruption to training activities. This project involved the development and installation of 12 revegetation procedures that combined four seedbed preparation methods and seeding options with three site-closure periods. In March 1987, the four seedbed preparation/seeding options and closure periods were selected, a study site design and location chosen, and specifications for the revegetation procedures developed. A German rehabilitation contractor attempted the specified seedbed preparation and seeding on the 13.5-ha site in June, but abnormally high rainfall, usually wet site conditions, and lack of adequate equipment prevented the contractor from completing six of the 12 planned procedures. Planning and execution of the project has nonetheless provided valuable information on the importance and use of soil analytical results, seed availability and cost data, contractor equipment requirements, and time required for planning future revegetation efforts. Continued monitoring of vegetative ground cover at the site for the next two years, combined with cost information, will provide necessary data to determine which of the six revegetation procedures is the most effective. These data will be used in planning future rehabilitation efforts on tactical training areas.

19830 (IAEA-R–6580-F, pp. 42-51) **Laboratory investigations of insecticide impregnated materials for the control of New World screwworm flies.** Harris, E.G. (Natural Resources Inst., Chatham (United Kingdom)); Brown, M.; Smith, S. Natural Resources Inst., Chatham (United Kingdom); Tsetse Research Lab., Bristol (United Kingdom); Natural History Museum, London (United Kingdom); Al-Fateh Univ., Tripoli (Lybia); International Atomic Energy Agency, Vienna (Austria). Feb 1992. Sponsored by International Atomic Energy Agency, Vienna (Austria). In *Development of an odour-baited insecticidal target system for the suppression of adults of the new world screwworm fly: Final report for the period 15 April 1991 - 31 January 1992.* 77p. Order Number DE92626112. Source: OSTI; NTIS (US Sales Only); INIS.

In laboratory tests, New World screwworm flies were found to be at least three orders of magnitude less susceptible to the insecticides deltamethrin, alphacypermethrin and cyfluthrin than are tsetse flies. Deltamethrin was the most toxic of the three insecticides to screwworm flies. For topical application, the LD50s for deltamethrin 20% suspension concentrate were 33 ng and 25 ng for male and female screwworm flies respectively, compared with 0.04 ng for tsetse, G.m. morsitans. In various tests simulating contact of screwworm flies with cloth or netting targets impregnated with insecticide, 100% kill was only achieved with 3.2% deltamethrin and contact times of at least 10 sec, although 100% knockdown for up to 24 hours was obtained with lower concentrations. No repellent effect was observed at the higher concentrations. Cloth targets impregnated with a high dose of insecticide and baited with an attractant could be effective against NWS flies, especially if after "knockdown" flies are removed by predators. 1 fig., 9 tabs.

19831 (IAEA-TECDOC–634, pp. 21-24) **The development and application of antigen-detection enzyme immunoassays (antigen-ELISA) for diagnosis and control of African trypanosomiasis.** Nantulya, V.M. (International Laboratory for Research on Animal Diseases, Nairobi (Kenya)); Lindqvist, K.J.; Masake, R.A. International Atomic Energy Agency, Vienna (Austria); Food and Agriculture Organization of the United Nations, Rome (Italy). Jan 1992. (CONF-9102172–: Seminar on African animal trypanosomiasis: Tsetse control, diagnosis and chemotherapy using nuclear techniques, Muguga (Kenya), 11-15 Feb 1991). In *Tsetse control, diagnosis and chemotherapy using nuclear techniques: Proceedings of a seminar held in Muguga, Kenya, 11-15 February 1991.* 259p. Order Number DE92626120. Source: OSTI; NTIS (US Sales Only); INIS.

Antigen-trapping enzyme immunoassays (Ag-ELISA) for the detection of circulating trypanosome antigens in the blood of infected animals were developed by ILRAD and the CTVM in response to a well-recognized need for improvement of the techniques for the diagnosis of African trypanosomiasis. With the conventionally used parasitological diagnostic methods, detection of the parasites is often curtailed by the fact that in the chronic phase of the disease, parasitaemia is intermittent and often not detectable. The antigen-trapping ELISA systems which were developed have already shown encouraging results; the assay systems detect circulating trypanosome antigens, therefore patent infections. Applied to the diagnosis of bovine trypanosomiasis, a sensitivity of 96% was observed at ILRAD, and with good specificity. The assays are easy to perform, the results can be read visually if necessary and large numbers of sera can be analysed at a time. A number of practical problems, such as transportability of biological reagents, the water quality required for the assay and the future assay quality assurance system are currently being addressed in the Network. Once these problems have been solved, the assays should be employed as a sensitive diagnostic tool in national tsetse and trypanosomiasis control programmes to determine the effectiveness of these programmes and to assess the efficacy and strategic use of trypanocidal drugs. (author). 13 refs.

19832 (IAEA-TECDOC–634, pp. 25-30) **Application of antigen-ELISA for the diagnosis of surra in selected camel herds in Kenya.** Olaho-Mukani, W. (Kenya Trypanosomiasis Research Inst., Nairobi (Kenya)); Munyua, W.K.; Omuse, J.K.; Njogu, A.R.; Mutugi, M.W. International Atomic Energy Agency, Vienna (Austria); Food and Agriculture Organization of the United Nations, Rome (Italy). Jan 1992. (CONF-9102172–: Seminar on African animal trypanosomiasis: Tsetse control, diagnosis and chemotherapy using nuclear techniques, Muguga (Kenya), 11-15 Feb 1991). Source: OSTI; NTIS (US Sales Only); INIS.

Kenya has about one million dromedary camels. These are kept in the arid and semi-arid areas of the eastern and north-eastern provinces of the country. The dromedary camel plays an important role in the livelihood of the nomadic pastoral tribes of Kenya, where they are mainly used for milk, meat and as draft animals. Of the diseases affecting camels in Kenya, trypanosomiasis due to Trypanosoma evansi is the most important. The disease causes mortality of up to 70%, abortions and wight losses in affected herds. Measures aimed at controlling the disease have always been hampered by the lack of sensitive diagnostic tests. In recent years, the application of enzyme immunoassays has greatly improved the diagnosis of trypanosomiasis. In an antigen-ELISA test which employs a monoclonal antibody, we were able to detect more than 90% of patent infection in affected camels. The test is sensitive, specific and easy to perform. The test is very promising in the diagnosis of patent and cryptic trypanosome infection. The significance of the results is discussed. (author). 10 refs, 4 figs, 2 tabs.

19833 (IAEA-TECDOC–634, pp. 31) **Validation of the ELISA technique for diagnosis of trypanosomiasis in cattle in Uganda.** Okuna, N.M. Published in summary form only.

ELISA, developed in ILRAD for diagnosis of T. congolense, T. brucei and T. vivax in cattle, has not been validated in Uganda. This study was undertaken to validate the technique. Negative reference sera were collected from 44 cattle in Kapchorwa, a tsetse-free area. The cattle were free of the three trypanosome species T. congolense, T. brucei and T. vivax by the haematocrit buffy coat technique (BCT). But by ELISA, three were positive for T. vivax, one for both T. congolense and T. vivax and one for T. congolense. Sera were collected from the same 44 cattle 10 weeks later. The cattle were again free of T. congolense, T. brucei and T. vivax, both by BCT and by mouse inoculations. Two cattle out of 450 screened at a centre 5 km away had T. vivax by BCT. The ELISA results for the second set of sera were quite similar to the results obtained from the first set of sera. The calculated optical density (D) cut off point was 50 for both T. brucei and T. vivax, but it was 60 for T. congolense. Sera from 5 cattle which had T. theileri and two which had microfilaria were all negative for antigenaemia by ELISA. Positive reference sera were collected form 40 cattle in a high tsetse challenge area. Using the haematocrit buffy coat technique, 5 had T. vivax, two had T. brucei and one had T. congolense. Checked by ELISA for antigenaemia, only 4 cattle were free of all the three trypanosome species, T. congolense, T. vivax and T. brucei. All the 40 cattle were treated with Diminazene aceturate at the rate of 7 mg/kg body weight. Two weeks later, the ELISA test showed that 10 cattle were free of any antigenaemia. Those still positive for antigenaemia had lower OD readings. The ELISA technique is valid. It is much more sensitive compared to parasitological tests. It is specific since none of the 7 cattle with either T. theileri or microfilaria gave positive results by ELISA. The technique would be very useful for epizootiological studies. (author).

19834 (IAEA-TECDOC–634, pp. 37) **Investigations of intramuscularly induced diminazene aceturate (Berenil^{R}) plasma levels in cattle under high tsetse and trypanosome challenge in the field.** Kratzer, R.D. Published in summary form only.

The prophylactic effect of trypanocides is significantly reduced under high fly and trypanosome challenge. It was assumed that this is due to a reduction of drug plasma levels by trypanosomes at the time of treatment and challenge. Cattle herded at the Kenya coast under high fly and trypanosome challenge and cattle herded at KETRI without fly and trypanosome challenge were treated repeatedly with Berenil^{R} and the plasma levels established using the HPLC technique. Comparing both groups of cattle, it was found that neither the height of the initial peak nor the half lives of the plasma levels were significantly different. (author).

19835 (IAEA-TECDOC–634, pp. 39) **A comparison of intramuscularly induced plasma levels of diminazene aceturate (Berenil^{R}), homidium bromide (Ethidium^{R}) and isometamidium chloride (Samorin^{R}) in infected and uninfected cattle.** Kratzer, R.D. Published in summary form only.

The prophylactic effect of trypanocides is significantly reduced under high fly and trypanosome challenge. It was assumed that this might be due to a reduction of drug plasma levels by trypanosome parasitaemia. The ^{14}C labelled trypanocidal drugs Berenil^{R}, Ethidium^{R} and Samorin^{R} were administered intramuscularly in uninfected and in cattle infected with Trypanosoma congolense. The radioactivity levels were determined in plasma. The results indicated a slight but non-significant reduction in initial plasma level in infected cattle. Therefore, it can be concluded that the amount of drug trypanosomes are taking up is not influencing the plasma level and therefore is not lowering the curative or prophylactic effect. (author).

Homidium bromide and isometamidium chloride are used extensively in the treatment of bovine trypanosomiasis in Africa, but no specific and sensitive method to detect the drug in plasma has been published yet. Comparing the methods of other investigators it was found that they could not overcome the protein binding of these drugs which reduced the available and determined drug to 10% of the real concentrations. These techniques overcome the protein binding by enzyme digestion and an alteration of the pH before adding the sample directly on clean-up columns. Drug recover rates above 80% were obtained. For the detection, the HPLC was employed using a C18 reversed phase analytical column and UV detection, determining both drugs as intact molecules. (author).

Isometamidium, a phenathridinium compound, has been used extensively both for prophylaxis and therapy against trypanosomiasis in cattle. The lack of detection of this drug in serum and urine within 24 hours following either i.v. or i.m. administration of the non-labelled drug as opposed to the labelled drug, would suggest either insensitivity of the methods used or rapid metabolism of the drug to compounds which are active against trypanosomes at these concentrations. A preliminary study was carried out using liver, kidney, bile, blood and urine samples from two groups of steers, one of which had been treated with ^{14}C-isometamidium labelled on the homidium molecule and the other with ^{14}C-isometamidium labelled on the benzamidine molecule and slaughtered 21 and 60 days after treatment. Isometamidium was detected in the liver up to 21 days post treatment but was not detected at 47 and 60 days post treatment. Metabolites which corresponded to homidium and benzamidine derivatives were detected in liver, kidney, bile and urine samples. No isometamidium was detected in urine collected 24 hrs after treatment. From this study, it seems that the prohylactic activity of isometamidium is due to homidium and/or its derivatives. (author). 8 refs, 3 tabs.

19838 (IAEA-TECDOC–634, pp. 45-51) **Solid phase extraction and reversed-phase high performance liquid chromatography of homidium in animal tissues.** Murilla, G.A. Source: OSTI; NTIS (US Sales Only); INIS.

Homidium bromide, an antitrypanosomal drug, has been in use for about 40 years both for chemotherapy and limited chemoprophylaxis but no specific and accurate method for its detection at sub-microgram levels in tissues is available. The HPLC method described uses C18 reversed phase analytical column with UV detection after basic sample extraction and clean-up on a 3 ml cyano Bond Elut disposable extraction column. Drug recoveries of up to 80% were obtained in the extracts. All tissues analysed were from animals treated with ^{14}C labelled homidium at a dose of 1 mg/kg body weight and slaughtered at 14, 21 and 28 days after treatment. Recoveries were determined by comparing radiometric and HPLC results. The advantage of this procedure was that large amounts of samples could be processed especially from tissues with low drug levels. The detection limit was 50 ng per gram wet tissue. This method is simple, fast, accurate and sufficiently sensitive to be used for monitoring drug levels in meat destined for human consumption. (author). 3 refs, 4 figs, 6 tabs.

19839 (IAEA-TECDOC–634, pp. 65-89) **Fat and Haematin contents of male tsetse flies Glossina pallidipes and G. m. morsitans (Diptera: Glossinidae) caught in odour-baited traps and artificial refuges in Zimbabwe.** Hargrove, J.W. (Bristol Univ., Bristol (United Kingdom). Tsetse Research Lab.); Packer, M.J. International Atomic Energy Agency, Vienna (Austria); Food and Agriculture Organization of the United Nations, Rome (Italy). Jan 1992. (CONF-9102172–: Seminar on African animal trypanosomiasis: Tsetse control, diagnosis and chemotherapy using nuclear techniques, Muguga (Kenya), 11-15 Feb 1991). In *Tsetse control, diagnosis and chemotherapy using nuclear techniques: Proceedings of a seminar held in Muguga, Kenya, 11-15 February 1991.* 259p. Order Number DE92626120. Source: OSTI; NTIS (US Sales Only); INIS.

Male G. m. morsitans and G. pallidipes caught in artificial refuges had 27 - 31% more fat than those caught in traps; mean haematin levels were 6.8 - 7.7 times higher, but haematin-specific fat levels did not differ between capture methods. Male G. pallidipes with haematin level >150 ug, which had fed <8 h previously, contained 3.2 mg fat - only 15% less than the highest observed levels. A differential equation model for bloodmeal metabolism is developed; it removes 99% of the variance in fat levels of male G. m. morsitans fed and then starved in the laboratory and 79% of this variance for the G. pallidipes field data. The model predicts a mean feeding interval (T) of 53 h and fat levels of 3.1 mg in newly fed flies - close to the observed value of 3.2 mg for flies containing more than 150 ug haematin. Haematin frequency data, analysed as suggested in the literature, suggested T = 71 h, with a 60 h non-feeding phase, but fat levels predicted by simulation were 40% lower than observed. For constant feeding rates, fat levels were well simulated for T = 53 h, but death rates (>5%/day due to starvation alone) were impossibly high. An alternative model, based on known changes in activities related to feeding, suggests that feeding rates increase linearly during the trophic cycle. For T = 53 h the model gives good predictions of fat levels in G. pallidipes, with starvation rates <1%/day; it is suggested that a proportion of tsetse with high fat and haematin feed off mobile hosts early in the trophic cycle. Over-estimates of T result from the failure to consider these flies and not to errors in the assumed time scale, nor failure to catch high-fat flies which visit stationary traps. (author). 32 refs, 16 figs, 2 tabs.

19840 (IAEA-TECDOC–634, pp. 91-103) **Study of the vectorial capacity of Glossina palpalis palpalis related to its digestive physiology and rearing conditions.** Abbeele, J. van den (Antwerp State Univ., Antwerp (Belgium). The tsetse midgut environment constitutes the early barrier in the development of the parasite in his insect host. Factors such as trypanolysins, midgut lectins and agglutinis have been shown by various authors to influence the establishment of a procyclic trypanosome population. So far, the digestive process has not been considered as a possible factor affecting the survival and differentiation of ingested trypanosomes. This paper deals with our investigations on the digestive physiology of Glossina palpalis palpalis. The course of the digestive cycle, the purification and partical characterization of midgut trypsin, the major proteolytic enzyme, are described. The possible interaction of the digestive activity and trypanosome development is discussed. (author). 20 refs, 8 figs, 3 tabs.

19841 (IAEA-TECDOC--634, pp. 105-117) **Biosynthesis of lipids in female tsetse flies following matings with radiation-sterilized or normal males.** Lambremont, E.N. (International Atomic Energy Agency, Seibersdorf (Austria). Laboratories); Taher, M. International Atomic Energy Agency, Vienna (Austria); Food and Agriculture Organization of the United Nations, Rome (Italy). Jan 1992. (CONF-9102172--: Seminar on African animal trypanosomiasis: Tsetse control, diagnosis and chemotherapy using nuclear techniques, Muguga (Kenya), 11-15 Feb 1991). Tsetse females mated to radiation-sterilized males have a pattern of lipid synthesis identical to those mated normally through nearly all levels of lipid content except one. Synthesis of lipids from injected (^{14}C)-1,2-acetate shows no mating condition correlation for total lipids, total phospholipids, total neutral lipids or for major sub-classes of phospholipids or most neutral lipids. Only the 1,2-diacylglycerols show a distinct depression of synthesis and then only in the uterine gland of a female mated to an irradiated male. Thus without carrying lipid analyses to a level distinguishing isomeric forms in a specific type of tissue, one could not discern an ultimate difference in the lipid biochemistry of the abnormally mated female. (author). 13 refs, 6 tabs.

Published in summary form only.

Glossina palpalis gambiensis is one of the four tsetse fly species together with G. tachinoides, G. m. submorsitans and countries of West Africa, it is an important vector of trypanosomiasis. The species is being maintained for a long time at the CRTA rearing centre, and is one of the three species for which the SIT was successfully used in the Sideradougou eradication campaign. Plans are in preparation to use flies from CRTA to mount an integrated control campaign with SIT component in the Tienfala-Baguineda agro-pastoral zone of Mali. Therefore, after preparatory work at the FAO/IAEA Seibersdorf Laboratory, series of fly infectivity studies were conducted at CRTA, using materials from the local stock colony and available trypanosome stabilates: Trypanosoma vivax (Zaria 81/486/699 and Banan 85/CRTA/78), T. congolense (Karankasso 83/CRAT/57) and T. b. brucei (Farakoba 80/CRTA/1). 1 tab.

The influence of repeated exposition of alternative hosts (rabbits, mice) to flies was characterized by two different types of adaptive response mechanisms: the induction of serum "killing factor", and the induction of high titre of circulating IgG cross-reacting with relatively wide spectrum of tsetse (glyco) proteins isolated either from various tissues, or whole body homogenates. The question remains how these pathways are involved in host-vector interaction under natural conditions. "Killing factor"seems to be responsible for dramatic increase of fly mortality following sucking. It is passively transferable but its effect disappears during about 5 days following sucking or passive immunization. On the contrary, the immunoglobulins persist in host blood for at least 70 days but they are probably not responsible for direct killing of biting flies. However, their role in fly longevity, reproduction, and vector-parasite interaction was determined. (author). 18 refs, 7 figs, 1 tab.

19845 (IAEA-TECDOC--634, pp. 143-150) **The durability of pyriproxyfen, a juvenile hormone mimic, for insect control.** Langley, P.A. (Bristol Univ., Bristol (United Kingdom). Tsetse Research Lab.); Mauchamp, B.; Royer, C.; Oouchi, H. International Atomic Energy Agency, Vienna (Austria); Food and Agriculture Organization of the United Nations, Rome (Italy). Jan 1992. (CONF-9102172--: Seminar on African animal trypanosomiasis: Tsetse control, diagnosis and chemotherapy using nuclear techniques, Muguga (Kenya), 11-15 Feb 1991). Source: OSTI; NTIS (US Sales Only); INIS.

Topical applications of the juvenile hormone mimic, pyriproxyfen, to adult females of the tsetse fly, Glossina morsitans morsitans, result in the production of offspring which fail to metamorphose. Similar applications to adult females of the triatomine bug Rhodnius prolixus, results in the production of non-viable eggs, while treatment of fifth instar larvae prevents metamorphosis or gives rise to adults which produce non-viable eggs. Exposure by tarsal contact to netting surfaces treated with an oil formulation of radiolabelled puriproxyfen, resulted in adult females of Glossina m. morsitans producing non-viable pupae for life. Netting stored under laboratory conditions showed no sign of loss or degradation of pyriproxyfen for 8 months. Similar netting exposed to natural conditions in the field in Zimbabwe has similarly shown no signs of degradation or of loss of the original amount of pyriproxyfen with which it was treated. The prospects of using pyriproxyfen as a safe substitute for conventional insecticides are promising. (author). 10 refs, 3 tabs.

19846 (IAEA-TECDOC--634, pp. 151-165) **Genetic studies on Glossina morsitans and Glossina palpalis related to genetic control.** Gooding, R.H. (Alberta Univ., Edmonton, AB (Canada). Entomology Dept.). International Atomic Energy Agency, Vienna (Austria); Food and Agriculture Organization of the United Nations, Rome (Italy). Jan 1992. (CONF-9102172--: Seminar on African animal trypanosomiasis: Tsetse control, diagnosis and chemotherapy using nuclear techniques, Muguga (Kenya), 11-15

Feb 1991). In *Tsetse control, diagnosis and chemotherapy using nuclear techniques: Proceedings of a seminar held in Muguga, Kenya, 11-15 February 1991.* 259p. Order Number DE92626120. Source: OSTI; NTIS (US Sales Only); INIS.

Non-assortative mating of closely related taxa and their low reproductive capacity makes tsetse likely targets for population suppression by use of sterile hybrids or satyrs. Evaluation of the potential for such control methods will be facilitated by a knowledge of the genetics of tsetse flies. At the University of Alberta, such studies are carried out on the following subspecies of tsetse: G. m. morsitans, G. m. centralis, G. m. submorsitans, G. p. palpalis, and G. p. gambiensis. Most of the genetic variants are detected by electrophoretic procedures, but five visible markers (ocra, salmon and sabr in G. m. morsitans; tan and brick in G. p. palpalis) are also maintained. Fourteen marker genes have been mapped in G. m. morsitans, four in G. m. submorsitans and two in G. p. palpalis. Other biochemical markers have been assigned to autosomes or the X chromosome and inbred lines are being established for mapping four X chromosome genes and four autosomal genes in G. p. palpalis. These marker genes are being used in studies of the genetic basis of hybrid male sterility, potential for introgressive hybridization, sperm use by double-mated females, genetic stability of tsetse colonies, and genetics of mating behaviour. Using genetically marked lines it has been established that an X -Y incompatibility is a major factor in the sterility of males produced by hybridizing G. m. morsitans and G. m. centralis, G. m. submorsitans and G. m. morsitans, and G. p. palpalis and G. p. gambiensis. In subspecies of morsitans, there are also maternally inherited factors that create asymmetries in the ability of flies to hybridize. Using genetically marked flies, it has been established that some twice-mated females use sperm from both matings. However sperm use is, in some cases, influenced by whether the male is from the same subspecies as the female and this suggests a severe limitation on the use of satyrs as genetic control agents. (author). 46 refs, 6 tabs.

19847 (IAEA-TECDOC-634, pp. 167-180) **Tsetse fly mass rearing: Colony management, deployment of sterile flies, related research and development.** Feldmann, U. In support of tsetse fly research and control programmes in Africa, seven economically important tsetse fly species (Glossina palpalis palpalis, G. tachinoides, G. fuscipes fuscipes, G. austeni, G. brevipalpis, G. pallidipes and G. morsitans submorsitans) are maintained at the Entomology Unit of the IAEA Agriculture Laboratory at Seibersdorf, Austria. All flies are reared without host animals and are fed exclusively by the membrane feeding technique. The strains of the first five species above are adapted to mass-rearing procedures and are maintained in numbers sufficient to meet the needs for field releases and for laboratory experiments. The colony of G. tachinoides is maintained at 100,000 females to demonstrate (i) the time required for transition of an adapted strain to a mass-reared colony, (ii) the ability to routinely ship pupae (35,000 every three weeks) a long distance and (iii) the high quality of sterile males originating from transported pupae. Topics requiring R and D for large scale use of SIT to combat tsetse flies include simplification and automation of the laborious day-to-day colony routine work. Emphasis is placed on procedures that offer potential for sex differentiation in pre-adult stages or that offer a better synchronization of adult emergence with minimal overlapping of the sexes. Development of methods for extending the duration of the pupal period would increase flexibility in preparing for long distance transport of pupae to release projects. For all tsetse fly species colonized at Seibersdorf, radiation dose-response data are collected and the quality of the treated fly material evaluated. The receptivity of irradiated virgin females to mating is studied, in view of using them as indicator or sentinel insects for detection and monitoring of native male populations existing at low density or being subjected to control measures. (author). 8 refs, 11 figs, 5 tabs.

19848 (IAEA-TECDOC-634, pp. 183-190) **A study of factors affecting the persistence of deltamethrin applied to cotton fabric for tsetse fly control.** Hussain, M. (International Atomic Energy Agency, Seibersdorf (Austria). Laboratories); Perschke, H. International Atomic Energy Agency, Vienna (Austria); Food and Agriculture Organization of the United Nations, Rome (Italy). Jan 1992. (CONF-9102172-: Seminar on African animal trypanosomiasis: Tsetse control, diagnosis and chemotherapy using nuclear techniques, Muguga (Kenya), 11-15 Feb 1991). In *Tsetse control, diagnosis and chemotherapy using nuclear techniques: Proceedings of a seminar held in Muguga, Kenya, 11-15 February 1991.* 259p. Order Number DE92626120. Source: OSTI; NTIS (US Sales Only); INIS.

The effect of selected lipohilic materials on the loss of deltamethrin applied to cotton fabric and washed with water was studied. Corn oil, paraffin, linseed oil and silicone oil reduced the leaching of deltamethrin by water from the fabric. The cumulative sum of four washings of the treated cotton strips resulted in a total loss of 37.7% of deltamethrin from the cotton strip (without protectant) and 9.9% from the strip treated with deltamethrin and corn oil. The effect of the colour of fabric and a UV absorber compound on the photodegradation of deltamethrin were also studied. Photodegradation was much less on the blue or black fabric than on the white fabric, and 2, 4-dihydroxy-benzophenone reduced the photodegradation of deltamethrin applied to cotton fabric. (author). 10 refs, 4 figs, 1 tab.

19849 (IAEA-TECDOC-634, pp. 191-192) **Experienced with odour baited insecticide impregnated targets for control of tsetse flies in Kenya.** Opiyo, E.A. Published in summary form only.

Tsetse control in Kenya has hitherto been by use of insecticide sprayed from the ground supplemented by limited bush clearing in areas where human trypanosomiasis occurs. Animal trypanosomiasis is controlled by chemotherapy. Due to the occurrence of resistant trypanosome strains on Galana Ranch and in the coastal strip and the demonstration in Zimbabwe that odour-baited deltamethrin-impregnated targets were highly effective control devices against morsitans group tsetse flies. KETRI undertook to test the effectiveness of targets in the Kenya situation on the Galana Ranch. This was in an effort to find an additional trypanosomiasis control strategy. This trial began in January 1986 and lasted three years. The success of the trail resulted in a similar trial being undertaken in the Lambwe Valley. The Lambwe trial began in July 1988 and the objectives were (i) to evaluate the effectiveness and sustainability of deltamethrin impregnated odour baited targets and (ii) to involve the community in installation and maintenance of targets for their own protection. (author).

Field testing of insecticide impregnated blue strips for persistence began in Lambwe Valley in the middle of October 1990. Samples from the strips are cut every 20 days and are subjected to bioassays using teneral G. morsitans while samples are sent to Seibersdorf, Austria, for chemical analysis. The daily temperature and rainfall figures are kept for the period of the trial. To date, three samples, including the day 0 sample have been tested using teneral tsetse flies. All tsetse flies that came into contact with the samples of treated strips cut on days 0,20 and 40 died, but after varying intervals. Observations are continuing. (author).

Experiments were conducted on the use of controlled-release (CR) formulations of pesticides using nuclear techniques for the control of tsetse flies (Glossina spp.). Strips of cotton fabric screens impregnated with Carbon-14-labelled deltamethrin formulations, some of which contained oils, UV light absorber or both were tested. Then the strips were hung under tsetse habitats and tests were repeated at intervals of 2-3 weeks for about 6 months. Tests were of two types: Bioassay tests against tsetse flies to determine which formulations had the longest residual toxicity and radioanalytical test for determining radioactivity left on the strips and how it correlated with bioassay tests. Results show that total radioactivity and mortality decreased with time being rapid on unprotected strips or that containing oil. The strip containing UV light absorber or Glossinex had high losses of activity but continued to attain high mortalities up to day 175. Strip containing both oil and UV light absorber had the best performance. Until day 175 it recorded 85% mortality and radioactivity loss of 41% while the rest of the strips had lost more than 75%. The seven main mechanisms whereby sprayed insecticides are rendered biologically inactive are identified. The beneficial diminution of these destructive effects by dissolution of the pesticide in a polymeric matrix is discussed. The problems of the controlled release delivery system so created and insecticide availability therefrom are analyzed in terms of the decreasing concentration of pesticide therein with the passage of time. The theory of a proposed method to circumvent the controlling laws of diffusion by dissolving the polymer in the insecticide, rather than vice versa, is explained and the idea of the addition of a bioinactive co-leaving component is introduced. The practicality of this new concept is demonstrated by the creation of a simple spray tank additive which forms a constant rate, polymeric, controlled release delivery system on the substrate sprayed. The functionality of the spray tank additive is exemplified by combination with three insecticides, methyl parathion, disulfoton and the toxin from Bacillus thuringiensis, and comparative biological testing. Published in summary form only.

Trypanosomiasis, a disease transmitted by tsetse flies, is a major constraint on Agricultural Production in Tropical Africa. In Zimbabwe where agriculture, and particularly stock raising, is of major economic and social significance, the control of the tsetse fly leading to its eradication is a task of national importance. Zimbabwe has achieved significant progress in tsetse and trypanosomiasis control with a total of 48,000 km^2 being cleared of tsetse since 1980. The cleared areas have been consolidated by planned human settlement whose agricultural production has increased following introduction of cattle which provide much needed traction power. Tsetse flies are now confined to an area of 25,000 km^2 along the Zambezi Valley. Several strategies are being used to control tsetse flies with the latest technique being the use of odour-baited insecticide-impregnated targets. When used at a density of 4/km^2, targets have been found to be extremely effective against the species of tsetse flies found in Zimbabwe. The work undertaken in Zimbabwe as well as prospects for the future within the EEC-funded Regional Tsetse and Trypanosomiasis Control Programme will be discussed. (author).

A collaborative research programme has been conducted to develop a practical tsetse management model that combines cost effective tsetse control method, strategic use of drugs and environmentally sound land use planning. In this connection, special efforts have been made to validate and modify the already known tsetse control techniques. The NGU trap baited with acetone and cow urine showed significant increases (4.8-fold for male flies and 7.5-fold for female flies) over the unbaited bioconical trap. The biconical traps baited with cow urine, hippo dung and Octenol yielded highter catches (1.3 to 2.6-fold increase for male flies, 1.4 to 4.6-fold for females) than unbaited bioconical traps. Cow urine, however, was the only one of these attractants that showed a significant increase in most instances. Biconical traps baited with pig urine and acetone showed a significant 2.6-fold increase over unbaited biconical traps. A new trap design (Tetra-trap) is tested against biconical and NGU traps. Cow urine, acetone and a 4:8:1 mixture of octenol, methyl phenol and propyl phenol obtained from the Tropical Diseases Research Institute was tested using the new trap design.

Published in summary form only.

The onchocerciasis eradication campaign in the west African subregion was a remarkable success which made formally deserted lands now suitable for settlement. Recent tsetse and trypanosomiasis surveys along the White Volta river indicate that livestock development would virtually be impossible in these areas without some form of intervention to contain animal trypanosomiasis. Apparent fly densities are in the order of 5-10 flies/trap/day (biconica traps) with fly infection rate being in the order of 1-8.0%. Trypanosomiasis is particularly prevalent in small ruminants (12-30%) with several reported cases of abortion. In view of the sparse human population in some of these areas, large scale control programmes would not be advisable unless there is a clear land-use plan. In the interim, however, efforts could be made to control the disease at the village level. This paper outlines some village-based strategies that could be adopted by settlers in these areas. (author).

19856 (IAEA-TECDOC–634, pp. 211) **Trypanosomiasis control and eradication of Glossina austeni from Zanzibar using an integrated approach.** Biwi, K.M. (Veterinary Office, Zanzibar (United Republic of Tanzania). Livestock Development Dept.). International Atomic Energy Agency, Vienna (Austria); Food and Agriculture Organization of the United Nations, Rome (Italy). Jan 1992. (CONF-9102172–: Seminar on African animal trypanosomiasis: Tsetse control, diagnosis and chemotherapy using nuclear techniques, Muguga (Kenya), 11-15 Feb 1991). Published in summary form only.

Eradication of G. austeni for the removal of the trypanosomiasis constraint from the island of Unguja, Zanzibar, appears feasible by using an integrated approach. The use of animals as living baits, treated with a 1% deltamethrin pour-on oil formulation, combined with drug treatment of animals found infected with trypanosomes was successful in grazing areas with a sufficient number of cattle. In areas where other tsetse hosts are present or where cattle are absent (like Jozani and Muyuni forests), stationary targets impregnated with Alfacypermethrin 10% E.C. were found effective in reducing fly populations. Such prior suppression is suitable before the release of sterile males. In order to enhance the future use of the SIT where cattle treatment or stationary targets alone may not result in tsetse eradication, pre-release studies on transportation and deployment of sterile flies produced at Tanga and released in a related block of the dense forest have commenced recently, as well as observations on the G. austeni populations structure. Results of work on the bait technology and investigative work using sterile flies are described in the papers of D. Hoereth-Boentgen and M. Vreysen et al. (author).

19857 (IAEA-TECDOC–634, pp. 213-218) **Control of Glossina austeni and cattle trypanosomiasis in Unjuga island by deltamethrin pour-on application to livestock and with stationary targets in cattle-free zones.** Hoereth-Boentgen, D.W. Source: OSTI; NTIS (US Sales Only); INIS.

Tsetse control with odour-baited artificial targets has been widely used in recent years in countries like Zimbabwe, Zambia, Ethiopia, Ivory Coast and Burkina Faso among others. More recently, this method was expanded by the use of the host animal itself, as a "living target". The development of highly effective synthetic pyrethroids in long-lasting formulations, and particularly the low mammalian toxicity of these compounds, made such an approach possible. The first trials have been carried out in Zimbabwe, Zambia, Zanzibar and recently at Mkwaja Ranch in Tanzania. Results achieved with FAO assistance in a pilot-trial in the Mangapwani area on Zanzibar have been converted into a large-scale operation under the UNDP/FAO supported project URT/86/022, aiming at complete removal of G, austeni from the island of Unjuga. The present paper outlines the results achieved so far with the use of sequential, topical application of deltamethrin on cattle, goats and donkeys to eradicate G. austeni. An alternative approach for tsetse control in areas where cattle are virtually absent is also described. (author). 12 refs, 2 tabs.

19858 (IAEA-TECDOC–634, pp. 219-230) **Laboratory and field observations in relation to the release of sterile Glossina austeni on Unjuga (Zanzibar) island.** Vreysen, M.J.B. The radiation treatments give to male Glossina austeni before their deployment in the field had no detectable effect on viability, insemination potential or competitiveness. Excellent results were obtained for both treated and untreated control males at cage densities of up to 800 flies. A total of 22,563 male G. austeni were transported from TTRI, Tanga, to the Jozani forest, Unjuga island, under two different release schedules. On average, 91.6% of the males transported were actually released. Direct transport in the morning (average transport time was 2.5 ± 0.5 hours) proved to be superior (release rate of 94.7%) compared to a schedule in which flies were transported from Tanga to Zanzibar in the evening with the release being done the next morning (release rate of 85.8%). Pre-release studies in the northern Jozani forest, demonstrated the efficiency of the sticky panel as a monitoring device for the collection of baseline data on apparent densities and age structure of the G. austeni population. Sterile female G. austeni were also released in the middle of the experimental block to test their usefulness as tracer insects. Treated females recovered 5 or more days post-release, were all found to be inseminated by native males. (author). 10 refs, 1 fig., 10 tabs.

Observations on flourishing resident herds and trade cattle within the Awka Zone in northern fringes of the rain forest belt of Anambra State, Nigeria, prompted this current study on the status of trypanosomiasis and tsetse distribution in the zone. Parts of the greater Mamu forest reserve and seven other forest patches covering 800 km^2 were studied. Except for two small forests others were infested with Glossina palpalis palpalis. 84 flies were captured, out of which one had mature Trypanosoma vivax infection. 443 cattle were examined in two slaughterhouses for trypanosomes. Only four of them had parasites that were identified morphologically as T. vivax. Deforestation due to industrialisation and development of the hinterland could contribute to lowered intensity of infection in an area originally thought very hazardous for livestock keeping. (author).

Botswana is at the extreme southern extent of the African tsetse belt, and most of the country does not provide a suitable environment for the maintenance of breeding tsetse fly populations. The principal permanent habitat is the Okavango Delta and its associated northern river system. The Okavango Delta is a sparsely settled area of permanent swamp, seasonal floodplain and low-lying islands. Tsetse existed in the delta long before written history of the area came into existence. Much of this infestation died out during the great rinderpest pandemic at the turn of the century, which decimated the host animals. Following collapse of the fly population, people took advantage of the situation and occupied more hospitable parts of the delta. However, the fly population eventually expanded to meet the settlers and in the early 1940's a conflict of interest arose. The Department of Tsetse Fly Control was subsequently formed. 1 tab.

Uganda, with a population of about 17 million people, depends largely on the Agricultural Sector both for subsistence and export. Uganda livestock stands at 4 million cattle, 2.5 million goats, 0.7 million sheep and 0.5 million pigs. The life of these animals is being threatened by various tropical diseases. Animal trypanosomiasis is endemic in all the 34 districts of Uganda except the highland areas of the country. These are correspondingly areas of high tsetse fly infestation. For effective control of this disease, therefore, an integrated approach is adopted. The country has been divided into three zones of disease incidence, namely the high, medium and low risk zones. Each zone has a slightly different treatment regime with curative and prophylactic trypanocidals as short term control measures. The long term aim is to eradicate the tsetse fly, and therefore, the disease.

Published in summary form only.

Historically, the potentially highly agricultural productive areas of Uganda, bordering the shores of Lake Victoria, have been plagued by the presence of tsetse flies. While Glossina pallidipes was reported to be main vector in the area, evidence has accrued indicating that G. fuscipes fuscipes is in fact the main vector on the island. There is also evidence that the species has adopted a peridomestic behaviour in this, predominantly, farming and fishing community. Since 1987/88, intensive surveys were conducted and current monitoring work concentrates on strategic sites such as water collection points, fishing camps, ports of call and selected villages on the island (Bulopa-Walwanda, Lwenyanga, Kyanamu, Tome, Isiriba and Kachanga). Making use of 20-25 pyramidal traps impregnated with deltamethrin (400 mg/trap) for 20-22 days/month, the G. f. fuscipes population around reference villages was considerably reduced (90-95% after 7-9 months). Arrangements are underway to evaluate insecticides treatments of domestic livestock host animals and monitor trends in the transmission of trypanosomiasis. In collaboration with UTRO, Tororo, experimental rearing of G. F. fuscipes will be undertaken aiming at producing flies for mark-release-recapture studies and trials with sterile flies.

19863 (IAEA-TECDOC-634, pp. 249) **Tsetse and trypanosomiasis at the Ngulia Rhino sanctuary.** Mihok, S. Published in summary form only.

The conservation of black rhinoceros (Diceros bicornis) in Kenya involves the translocation of rhinoceros to protected sanctuaries, e.g. the recently enlarged 69 km^2 sanctuary at Ngulia in Tsavo West National Park. As the black rhinoceros is known to be particularly susceptible to infection with Trypanosoma brucei, there is a strong possibility that the stress of translocation will induce health problems that would not normally occur in resident populations. Similarly, the movement of animals born in tsetse-free areas to tsetse-infested areas may result in trypanosomiasis problems because of loss of immune protection in the absence of challenge in early life. Finally, there is some concern over the possibility of facilitating genetic exchange in T. brucei through the artificial movement of animals over long distances into novel environments. To aid in the development of prudent management practices, we initiated baseline studies on tsetse distribution and trypanosomiasis at the Ngulia sanctuary. To date, we have completed a dry season survey of tsetse distribution over a 125 km^2 area centred on the sanctuary and have characterized the nature of the trypanosomiasis challenge in different areas. Trypanosomiasis challenge at Ngulia involves a variety of Trypanosoma spp. Nevertheless, an unusual finding is the lack of diversity in Nannomonas parasites, with most belonging to the savannah group of T. congolense.

Source: OSTI; NTIS (US Sales Only); INIS.

Various aspects of radioactive contamination monitoring of environmental objects and food with regard to sample isotope composition changing in time, are considered. In samples of technogenic origin with relatively low activity a notable difference in data, obtained by gamma-spectrometric analysis and beta-radiometry methods is explained by the effect of natural ^{40}K contained in samples. Recommendations concerning gamma-spectrometry method application to such samples are given.

19868 (AECL–9825-1) **Supplement to dose conversion factors for air, water, soil and building materials.** Holford, R.M. Atomic Energy of Canada Ltd., Chalk River, ON (Canada). Chalk River Nuclear Labs. Aug 1989. 405p. Order Number DE92626202. Source: OSTI; NTIS (US Sales Only); INIS.

The calculations described in the original report, AECL-9825, have been repeated on a more recent database obtained from Oak Ridge National Laboratories (US). This database was apparently derived from the Evaluated Nuclear Structure Data File (ENSDF) and was used as the basis for the preparation of ICRP publication number 38. Data for 826 nuclides are given, including Argon-42 which was added to the database manually. Because the new database is more detailed than that used previously, and the beta-spectrum calculation sub-routine was improved, these new calculations are believed to be more accurate than those in the original report. This report does not entirely replace the original version, however, since there are a few nuclides that were included in that report but not in the current one.

19869 (AECL–9959, pp. 287-293) **Assessing the distribution of radioresponse in human populations: Individual variation in radiosensitivity and possible relations to radiogenic cancer risk.** Morrison, D.P. (Atomic Energy of Canada Ltd., Chalk River, ON (Canada). Chalk River Nuclear Labs.); Gentner, N.E.; Werner, M.M. Atomic Energy of Canada Ltd., Chalk River, ON (Canada). Chalk River Nuclear Labs. Jun 1989. (CONF-8903142–: Workshop/symposium on radiation protection: past and future, Chalk River (Canada), 20-22 Mar 1989). In *Proceedings of the workshop/ symposium on radiation protection: past and future.* 346p. Order Number DE92620360. Source: OSTI; NTIS (US Sales Only); INIS.

Using a novel assay to assess the radiosensitivity of lymphoblastoid cell lines developed from individual donors, we have shown that the radioresponses of lymphoblastoid cell lines derived from ostensibly normal persons may cover a wide range. By comparison to lines of known radiosensitivity, a significant proportion of these normal lines may exhibit extreme hypersensitivity. Abnormal radiosensitivity in the in vitro assay appears attributable to deficient ability to accomplish effective DNA repair of ionizing radiation-induced DNA damage, and may serve to identify a subset of the population with greater-than-expected susceptibility to 'spontaneous', and possibly radiogenic, cancer. Identification of susceptible subpopulations may affect radiation protection practices in the future.

19870 (AECL–10293) **Causes of death among long-term employees of Chalk River Laboratories, 1966-1989.** Werner, M.M.; Myers, D.K. Atomic Energy of Canada Ltd., Chalk River, ON (Canada). Chalk River Nuclear Labs. Nov 1990. 22p. Order Number DE92626201. Source: OSTI; NTIS (US Sales Only); INIS.

Data on mortality among long-term employees of Chalk River Laboratories to 1989 December 31 are reported. The 1988 Hare report, entitled The Safety of Ontario's Nuclear Power Reactors, noted that there had been a steady rise in standardized mortality ratios (SMR) for cancer among these employees in the last three successive five-year periods from 1971-75 to 1981-85. None of the SMRs was significantly different from unity; however, the apparent trend could be indicative of the development of latent cancers. The present report was prepared to see if that increasing trend in cancer SMRs continued. In the years 1986-89, the SMR for cancer among long-term male employees was exceptionally low. The wide fluctuations seen in our data over time are likely anomalies arising from the small size of the study group rather than problems arising from radiation exposures on site.

19871 (AERE-R–13826) **Interception of radioactive fallout by vegetation.** Chamberlain, A.C.; Garland, J.A. AEA Environment and Energy, Harwell (United Kingdom). Dec 1991. 18p. Order Number DE92627979. Source: OSTI; NTIS (US Sales Only); INIS.

A review has been carried out of information on the fraction of radioactive material, deposited by dry or wet deposition processes, that is intercepted by vegetation. The amount of information available is limited, but it is clear that a substantial fraction may be intercepted in some circumstances. In dry deposition, the results of measurements indicate that interception decreases with increasing particle size for particles larger than about 40 μm. In low volume water sprays, interception fractions for ^{7}Be, ^{89}Sr and microspheres of 3 to 25 μm diameter were similar, but that for periodate was lower. The fraction intercepted decreased with an increase in the amount of simulated rainfall. The data are particularly sparse for dry deposition of particles smaller than 30 μm diameter. In addition, there is no information on interception at the moderate rates of rainfall common in Britain, and little is known of the differences between various species of plants. (author).

19872 (CONF-9203121-2) **Dose conversion factors.** Kocher, D.C.; Eckerman, K.F. Oak Ridge National Lab., TN (United States). [1992]. 35p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. From Pathway analysis and risk assessment for environmental compliance and dose reconstruction; Kiawah Island, SC (United States); 2-6 Mar 1992. Order Number DE92011036. Source: OSTI; NTIS; INIS; GPO Dep.

The following is discussed in this report: concepts and quantities used in calculating radiation dose from internal and external exposure. Tabulations of dose conversion factor for internal and external exposure to radionuclides. Dose conversion factors give dose per unit intake (internal) or dose per unit concentration in environment (external). Intakes of radionuclides for internal exposure and concentrations of radionuclides in environment for external exposure are assumed to be known. Intakes and concentrations are obtained, e.g., from analyses of environmental transport and exposure pathways. differences between dosimetry methods for radionuclides and hazardous chemicals are highlighted.

19873 (DOE/ER/60621-5) **Repair of uv damaged DNA: Genes and proteins of yeast and human: Progress report, November 1, 1991–April 15, 1992.** Prakash, L. Rochester Univ., NY (United States). School of Medicine and Dentistry. Apr 1992. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG02-88ER60621. Order Number DE92013002. Source: OSTI; NTIS; GPO Dep.

Our objectives are to determine the molecular mechanism of the incision step of excision repair of ultraviolet (UV) light damaged DNA in eukaryotic organisms, using the yeast Saccharomyces cerevisiae as a model system, and to study the human homologs of yeast excision repair and postreplication repair proteins progress is described.

19874 (GSF-30/91) **The calculation of dose from external photon exposures using reference human phantoms and Monte Carlo methods. Pt. 6. Organ doses from computed tomographic examinations.** Zankl, M. (GSF - Forschungszentrum fuer Umwelt und Gesundheit GmbH, Neuherberg (Germany). Inst. fuer Strahlenschutz); Panzer, W.; Drexler, G. GSF - Forschungszentrum fuer Umwelt und Gesundheit GmbH, Neuherberg (Germany). Nov 1991. 126p. Contract CEC 890071. Order Number DE92511441. Source: OSTI; NTIS (US Sales Only); INIS.

Computed tomography (CT) is a technique which offers a high diagnostic capability; however, the dose to the patient is high compared to conventional radiography. This report provides a catalogue of organ doses resulting from CT examinations. The organ doses were calculated for the type of CT scanners most commonly used in the FRG and for three different radiation qualities. For the dose calculations, the patients were represented by the adult mathematical phantoms Adam and Eva. The radiation transport in the body was simulated using a Monte Carlo method. The doses were calculated as conversion factors of mean organ doses per air kerma free in air on the axis of rotation. Mean organ dose conversion factors are given per organ and per single CT slice of 1 cm width. The mean dose to an organ resulting from a particular CT examination can be estimated by summing up the contribution to the organ dose from each relevant slice. In order to facilitate the selection of the appropriate slices, a table is given which relates the mathematical phantoms' coordinates to certain anatomical landmarks in the human body. (orig.).

Published in summary form only.

We have investigated the effects of irradiation on Glossina species which have been the subject of sterile male release compaigns in West Africa. From these studies it is clear that (i) irradiation at standard doses used in SIT causes substantive damage to Glossina midgut and markedly changes peritrophic membrane structure, (ii) irradiation effects reduce levels of lectins and lysin secretion by Glossina midgut cells, (iii) irradiation inhibits production of midgut proteases and (iv) these changes create conditions for enhanced growth of trypanosomes in the midgut. In addition, major differences in the biochemical profile of G. palpalis palpalis and G. p. gambiensis have been found particularly in midgut lectins and lysins and in the characteristics of salivary gland binding using labelled lectins. It is clear that G. p. palpalis (from the Vienna in vitro fed stock colony) is refractory to Trypanozoon and that its contribution to the transmission of trypanosomes (Nannomonas and Trypanozoon) in areas where this subspecies has been released is probably negligible. This study highlights the need to assess vectorial capacity of target species precisely and evaluate cost-effectiveness of any inputs in relation to control benefits.

19877 (INFO-0206(add.)) **Comparison of the distribution of non-radiological and radiological fatal risk in Ontario industries (addendum).** Davis, C.K. (Waterloo Univ., ON (Canada)); Forbes, W.F.; Hayward, L.M. Atomic Energy Control Board, Ottawa, ON (Canada). Sep 1986. 16p. Order Number DE92628369. Source: OSTI; NTIS (US Sales Only); INIS.

Addendum to report INFO-0206.

Occupational limits for exposure to ionizing radiation, in force in Canada, are based on recommendations of international bodies, particularly the International Commission on Radiological Protection (ICRP). To determine whether the ICRP assertions concerning the similarity of the distributions of occupational risk at the higher risk levels (from non-radiation and from radiation work) to Canada a study of the high end of the distributions of non-radiological risk of occupational fatalities in the province of Ontario was performed. For the present study total doses from exposure to sources of ionizing radiation for Ontario workers were converted to relative risk rates to allow direct comparison with the non-radiological results. In addition, absolute values for the radiological risk rates (RRR) were derived. The radiological risk estimates are based on workers who work both from nuclear reactions and from X-rays. The conclusion is made that the radiological and non-radiological risk rate (NRRR) distributions are similar in shape, but the RRR are approximately 1 to 27 percent of the NRRR, depending on the industry concerned.

19879 (INIS-mf–13182) **Report of the United Nations Scientific Committee on the Effects of Atomic Radiation: General Assembly. Official records: Forty-third session, suppl. no. 45 (A/43/45).** United Nations Scientific Committee on the Effects of Atomic Radiation, New York, NY (USA). Aug 1988 78p. Order Number DE92626023. Source: OSTI; NTIS (US Sales Only); INIS.

The report summarizes the main conclusions of specialized studies on the effects of atomic radiation on man. The material is divided into a historical review, in which the developments and trends that have become apparent throughout the years are presented, and a discussion of the present situation, highlighting the conclusions drawn from the most recent studies on radiation physics and biology. The report is written at a general level; the scientific annexes, to be published separately, forming the basis for the report's conclusions are written in a format essentially aimed at specialists. 2 figs, 11 tabs.

The lethal effect of various kinds of radiation is usually characterized by the survival curve, or the S(D) function, expressing the fraction of cells persisting after the application of dose D. Detailed analysis based on data obtained in vivo demonstrates that the survival curves can generally have a rather complex shape. The principal damage responsible for the lethal effect consists in the so-called double fractures of chromosomal DNA molecules, resulting in combinations of adjacent single fractures in the two chains of the molecule. Damage of all the other systems can be repaired by the cell rather easily. Thus, the shape of the survival curve is generally governed by the formation of the double fractions as well as by the rate of the repair process. In the radiotherapy of tumor diseases, the tumor focus is destructed while sparing, as far as possible, the healthy cells from which the proliferation and restitution of the tissue should proceed. This can be achieved by fractionation of the total dose. The fractionation regime is characterized by the total dose D, total exposure T and the number of fractions. (Z.S.). 4 refs.

Evaluation of a dose of internal irradiation of a human living in the Lithuanian territory, obtained during several years as a result of using domestic food stuffs contaminated with radioactive cesium (^{137}Cs) due to the Chernobyl NPP accident is presented. A mathematical model allowing one to obtain an evaluation of a change with time of a radionuclide content in a human body, as well as of the absorbed β- and γ-radiation dose rate is presented. It is shown that according to the data available on the cesium isotope concentrations in food stuffs in the Lithuanian territory the dose of internal irradiation did not exceeded 1 mZv for the first two years after the accident. 3 refs.; 4 figs.

Effect of natural-soil conditions on ^{90}Sr and ^{137}Cs accumulation factor (AF) in barley plants is studied at the Lithuanian republican chemization station. It is shown that in most cases AF is higher in barley grown in the Eastern part of Lithuania and in the Mid-Lithuanian lowland. Study of effect of continuous utilization of fertilizers on radionuclide accumulation in sugar beet has demonstrated an increase of ^{90}Sr and ^{137}Cs content in the soil (up to 1.5 times) and in sugar beet (up to 2 times) as compared to the section under control. 3 refs.; 1 tab.

State of radioecological monitoring in the region of Lithuania is considered. It is shown that detection of radioactive substances in the atmosphere, plants, food stuff in the republic is conducted in several Laboratories, therefore the data obtained are dissipated in various organizations. In connection with radioactive pollution of Lithuanian territory due to the Chernobyl accident and Ignalinsk NPP operation it is proposed to expand scientific investigations into radioactive pollution of the environment and to create a system of interdepartmental radioecologic monitoring. The radioecologic data obtained should be accumulated and processed using a computer, analysed and stored in a data bank of the republican radiometering laboratory. 3 figs.

A mathematical model of optimal radiation monitoring in a two-dimensional radiation field is developed. A mathematical model of radionuclide scattering in the atmosphere, density of population distribution across the territory, response function (radiation cancerogenesis dose-effect), mean square error of a single measurement and the goal function appear to be the source components of the model. The model allows one to determine the optimal density of radiation monitoring point distribution and the optimized system efficiency (the ratio of measurement number in non-optimized and optimized systems). The calculations are performed using Mega-CAMAC/SM-4 computer with MSI program, CF1 subprogram and standard SIMQ program written in FORTRAN. It is shown that application of optimal weight factors allows one to 10 times reduce the amount of measurements. The choice of points with minimal dispersion of the expected number of biologic effects allows one to several times increase the optimized observation system efficiency. 3 refs.; 5 tabs.

In *Experience and problems* *of optimization of dosimetric measurements and organizing of the regional system of radioecological monitoring.* Order Number DE92001358. Source: OSTI; NTIS (US Sales Only); INIS.

In connection with radioactive contamination of the territory of a number of republics as a result of the Chernobyl NPP accident, organization of personal dosimetry (PD) of external irradition of population is considered. It is shown that personal dosimetry is a component of the work of the public health services (PHS). The equipment applied is considered, in which case the prospects of thermoluminescence dosimeters is underlined. Functions of groups and single PD sections of regional, district and republican PHS are enumerated. Example of calculating an optimal number of persons subjected to PD, is given. It is proposed to use the Electronika-type microcomputers for accumulation and primary processing of data. 7 refs.; 1 tab.

In *Experience and problems of optimization of dosimetric measurements and organizing of the regional system of radioecological monitoring.* Order Number DE92001358. Source: OSTI; NTIS (US Sales Only); INIS.

An express-method for regeneration of specific activity by the value of exposure dose rage, applied for express-evaluation of biologic wastes of mean and low specific activity, is proposed. It is ensured with 0.99 probability therewith that for low and mean activity biological wastes the empiric dependence regenerated is empiric. 3 refs.; 1 tab.

19908 (LBL-31398) **Problems in mechanistic theoretical models for cell transformation by ionizing radiation.** Chatterjee, A.; Holley, W.R. Lawrence Berkeley Lab., CA (United States). Oct 1991. 8p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC03-76SF00098. (CONF-9109107-5: Workshop on biophysical modelling of radiation effects, Padua (Italy), 2-5 Sep 1991). Order Number DE92010265. Source: OSTI; NTIS; GPO Dep.

A mechanistic model based on yields of double strand breaks has been developed to determine the dose response curves for cell transformation frequencies. At its present stage the model is applicable to immortal cell lines and to various qualities (X-rays, Neon and Iron) of ionizing radiation. Presently, we have considered four types of processes which can lead to activation phenomena: (1) point mutation events on a regulatory segment of selected oncogenes, (2) inactivation of suppressor genes, through point mutation, (3) deletion of a suppressor gene by a single track, and (4) deletion of a suppressor gene by two tracks.

19909 (LBL-31685) **Relating space radiation environments to risk estimates.** Curtis, S.B. Lawrence Berkeley Lab., CA (United States). Oct 1991. 24p. (CONF-9110312-2: NATO Advanced Studies Institute on the biological effects and physics of solar and galactic cosmic radiation conference, Faro (Portugal), 13-22 Oct 1991). Order Number DE92010256. Source: OSTI; NTIS; GPO Dep.

This lecture will provide a bridge from the physical energy or LET spectra as might be calculated in an organ to the risk of carcinogenesis, a particular concern for extended missions to the moon or beyond to Mars. Topics covered will include (1) LET spectra expected from galactic cosmic rays, (2) probabilities that individual cell nuclei in the body will be hit by heavy galactic cosmic ray particles, (3) the conventional methods of calculating risks from a mixed environment of high and low LET radiation, (4) an alternate method which provides certain advantages using fluence-related risk coefficients (risk cross sections), and (5) directions for future research and development of these ideas.

19910 (LMF-134) **Inhalation Toxicology Research Institute annual report, October 1, 1990-September 30, 1991.** Shyr, L.J.; Finch, G.L.; Bradley, P.L. (eds.). Lovelace Biomedical and Environmental Research Inst., Albuquerque, NM (United States). Inhalation Toxicology Research Inst. Dec 1991. 307p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-76EV01013. Order Number DE92012104. Source: OSTI; NTIS; GPO Dep.

This report from the Inhalation Toxicology Research Institute describes research in the following areas: characterization of airborne materials and generation of experimental exposure atmospheres; deposition and clearance of inhaled toxicants; metabolism and markers of inhaled toxicants; carcinogenic responses and noncarcinogenic responses to inhaled toxicants; mechanisms of carcinogenic responses and noncarcinogenic responses to inhaled toxicants; University of Utah studies of injected actinides; mathematical modeling applications. (CBS)

19911 (LUMEDW-MEMR-1002) **Radiation dosimetry using magnetic resonance imaging: Development of a dosimeter gel for measurements of 3D dose distribution in radiotherapy.** Olsson, L.E. Lund Univ., Malmoe (Sweden). Dept. of Radiation Physics. 13 Dec 1991. 108p. Order Number DE92626220. Source: OSTI; NTIS (US Sales Only); INIS.

A new dosimetry system for 3D dose distribution measurements based on the Fricke dosimeter and magnetic resonance imaging (MRI) has been developed. The dosimeter consists of a ferrous sulphate solution incorporated in an agarose gel, which together constitute the dosimeter gel. The absorbed dose to the gel is measured by means of the proton spin-lattice relaxation rate, 1/T1 in an MR scanner. The dose distribution to an arbitrary slice within a dosimeter gel phantom can thus be determined. The chemical yield of the dosimeter gel is significantly higher than that of the for Fricke solution, and is strongly dependent of the initial ferrous sulphate concentration, assuming that the gel is bubbled with oxygen during preparation. A gel of 1.5 mM [Fe^{2+}] and 50 mM [H_2SO_4] has a sensitivity of 0.108 $s^{-1}Gy^{-1}$ and is linear up to 50 Gy. The dosimeter gel has uniform dose response over large volumes. Above 50 mM[H_2SO_4] the yield increases only slightly, but the gel strength decreases and results in gel phantoms with non-uniform dose response. Below 50 mM[H_2SO_4] the sensitivity of the dosimeter falls rapidly due to the decreased relaxivity of the ferric ions. The high chemical yield can be explained by a chain reaction and a reaction scheme is accordingly proposed. The dosimeter gel shows no dependence on dose rate or radiation quality and can be regarded as water-equivalent with respect to the interaction of the radiation. The diffusion coefficient of the ferric ions in the agarose gel is 1.19×10^{-2} cm^2/h. The diffusion blurs the dosimeteric image, but poses only a minor problem if the MR measurements are completed within the first two hours after irradiation. Dose distribution data from external radiation therapy units have been determined using the dosimeter gel and MRI with good accuracy, but the precision is poor, about 5-10%. (au) (84 refs.).

19912 (NEI-NO-196) **Measures against nuclear accidents: Recommendations on further strengthening of Norwegian preparedness against nuclear accidents.** Sosialdepartementet, Oslo (Norway). Jan 1992 179p. (In Norwegian). Order Number DE92628035. Source: OSTI; NTIS (US Sales Only); INIS.

A select committee appointed by the Norwegian Ministry of Social Affairs put forward proposals concerning measures for the improvement of radiation protection preparedness in Norway. On the basis on an assessment of the potential radiation accident threat, the report examines the process of response, and identifies the organizational and management factors that influence that process.

19913 (NEI-NO-197) **Radiation protection for the patient in X-ray diagnostics: Gonad shielding.** SIS Raad. Statens Inst. for Straalehygiene, Oslo (Norway). 1991 10p. (In Norwegian). Order Number DE92628040. Source: OSTI; NTIS (US Sales Only); INIS.

This publication describes the Code of Practice for gonade shielding in X-ray diagnostics. The intention is to achieve common routines in Norwegian health institutions.

19914 (NPL-RSA(EXT)-18) **Intercomparison of the medium energy primary standards for X-ray exposure of NPL and ENEA, Italy.** Moretti, C.J. (National Physical Lab., Teddington

(United Kingdom). Div. of Radiation Science and Acoustics); Heaton, J.A.; Laitano, R.F.; Toni, M.P. National Physical Lab., Teddington (United Kingdom). Apr 1991. 16p. Order Number DE92626192. Source: OSTI; NTIS (US Sales Only); INIS.

An intercomparison between the primary standards of exposure for medium energy X-rays held by the National Physical Laboratory (NPL) and ENEA in Italy is described. The intercomparison, using four different transfer chambers, took place at NPL in December 1989 and at ENEA during March 1990. Measurements were made at four therapy-level qualities, with half value layers of 0.15, 0.5, 1.0 and 2.5 mm Cu (nominal generating voltages of 100, 135, 180 and 250 kV respectively). At the 2.5 mm Cu HVL quality the primary standards were found to agree to within about 0.8%; for the other three qualities the chambers differed by no more than 0.3%. (author).

19915 (NPL-RSA(EXT)–19) **Intercomparison of the low energy primary standards for X-ray exposure of NPL and ENEA, Italy.** Moretti, C.J. (National Physical Lab., Teddington (United Kingdom). Div. of Radiation Science and Acoustics); Heaton, J.A.; Laitano, R.F.; Toni, M.P. National Physical Lab., Teddington (United Kingdom). May 1991. 11p. Order Number DE92626193. Source: OSTI; NTIS (US Sales Only); INIS.

An intercomparison between the primary standards of X-ray exposure for low energy X-rays held by the National Physical Laboratory (NPL) in the United Kingdom and ENEA Italy is described. The intercomparison directly between the two standard chambers took place at NPL during December 1989. Measurements were made at three therapy-level qualities with half value layers of 0.036, 0.25 and 1.00 mm Al (nominal generating voltages of 10, 24 and 50 kV respectively). The two primary standards agreed to within ±0.3%. (author).

19916 (NUREG/CR–5631-Rev.1) **Contribution of maternal radionuclide burdens to prenatal radiation doses: Interim Recommendations: Revision 1.** Sikov, M.R. (Nuclear Regulatory Commission, Washington, DC (United States). Div. of Regulatory Applications); Hui, T.E.; Meznarich, H.K.; Thrall, K.D.; Traub, R.J. Nuclear Regulatory Commission, Washington, DC (United States). Div. of Regulatory Applications; Pacific Northwest Lab., Richland, WA (United States). Mar 1992. 156p. Sponsored by Nuclear Regulatory Commission, Washington, DC (United States). DOE Contract AC06-76RL01830. (PNL–7445-Rev.1). Source: OSTI; NTIS; INIS; GPO.

This report discusses approaches to calculating and expressing radiation doses to the embryo/fetus from internal radionuclides. Information was obtained for selected, occupationally significant radionuclides in chemical forms that provided a spectrum of metabolic and dosimetric characteristics. Fractional placental transfer and/or ratios of concentration in the embryo/fetus to that in the woman were estimated for these materials, and were combined with data from biokinetic transfer models to predict radioactivity levels in the embryo/fetus as a function of stage of pregnancy and time after entry into the transfer compartment or blood of the pregnant woman. Medical Internal Radiation Dosimetry (MIRD) methodologies were extended to formalize and describe details for calculating radiation absorbed doses to the embryo/fetus. Calculations were performed for representative situations; introduction of 1 μCi into a woman's blood at successive months of pregnancy was assumed to accommodate the stage dependence of geometric relationships and biological behaviors. Summary tables of results, correlations, and dosimetric relations, and of tentative generalized categorizations, are provided in the report.

19917 (NUREG/CR–5797) **IMPACTS–BRC, Version 2.1: Code and data verification.** Rao, R.R. (Sandia National Labs., Albuquerque, NM (United States)); Kozak, M.W.; Harlan, C.P.; Bensonhaver, S.D.; Austin, V.; Rollstin, J.A. Nuclear Regulatory Commission, Washington, DC (United States). Div. of Regulatory Applications; GRAM, Inc., Albuquerque, NM (United States). Apr 1992. 196p. Sponsored by Nuclear Regulatory Commission, Washington, DC (United States). DOE Contract AC04-76DP00789. (SAND–91-2226). Source: OSTI; NTIS; INIS; GPO.

In the Federal Register, Volume 51, Number 168, NRC has intended the use of IMPACTS-BRC to evaluate petitions for evaluating radioactive waste streams as below regulatory concern. IMPACTS-BRC is a generic radiological assessment code that allows calculation of potential impacts to maximum individuals, waste disposal workers, and the general population resulting from exemption of very low-level radioactive waste from regulatory control. The code allows calculations to be made of human exposure to the waste by many pathways and exposure scenarios. This document describes the code history and the quality assurance work that has been carried out on IMPACTS-BRC. The report includes a summary of all the literature reviews pertaining to IMPACTS-BRC up to Version 2.0. The new code and data verification work necessary to produce IMPACTS-BRC, Version 2.1 is presented. General comments about the models and treatment of uncertainty in IMPACTS-BRC are also given.

19918 (OEFZS–4617) **Results of field studies on ^{90}SR and stable SR soil-to-plant transfer.** Gerzabek, M.H.; Artner, C.; Horak, O.; Mueck, K. Oesterreichisches Forschungszentrum Seibersdorf GmbH (Austria). Jan 1992. 20p. Order Number DE92626083. Source: OSTI; NTIS (US Sales Only); INIS.

In 1987 and 1988 at 35 sites plants ready to harvest and the corresponding soils (0 - 20 cm) were collected for ^{90}Sr and stable strontium analyses. Sample preparation and measurement led to a detection limit of 0.008 Bq ^{90}Sr kg^{-1}. The ^{90}Sr-contamination of Austrian soils ranged from 396 to 1998 Bq m^{-2}. Known from literature the contribution of the Chernobyl fallout amounted to app. 25 % of the total contamination. Stable strontium contents of the soils were between 6 and 62.5 mg kg^{-1}. Bariumtriethanolamine extracted 17.7 to 62.3 % of the total stable Sr in soil. ^{90}Sr-concentrations in cereal grains ranged from 0.03 to 0.67 Bq kg^{-1} (fresh wight) for maize and barley, respectively. The values for other foodstuff were between 0.15 (white cabbage) and 0.91 Bq kg^{-1} (spinach). Stable strontium contents were between 0.079 mg kg^{-1} (maize) and 72.5 mg kg^{-1} (celery shoot). The following mean ^{90}Sr soil-to-plant transfer factors for cereal grains were obtained: 0.010 (maize), 0.097 (rye), 0.049 (wheat), 0.095 (barley). Transfer factors for straw were up to 50 times higher (maize). The transfer of ^{90}Sr into vegetables and potatoes reached the same order of magnitude compared to the cereals. In all cases soil-to-plant transfer of stable Sr was clearly lower up to 60 % of the respective values for ^{90}Sr. Thus natural stable strontium is less plant available than ^{90}Sr. The influence of soil parameters on the ^{90}Sr transfer into plants was examinated by correlation analyses. Increasing exchangeable calcium contents of the soils resulted in a significant reduction of Sr soil-to-barley straw transfer. (authors).

19919 (ORNL/TM–11882) **Proceedings of the third conference on radiation protection and dosimetry.** Swaja, R.E.; Sims, C.S.; Casson, W.H. (eds.). Oak Ridge National Lab., TN (United States). Oct 1991. 169p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. (CONF-911004–: 3. conference on radiation protection and dosimetry, Orlando, FL (United States), 21-24 Oct 1991). Order Number DE92011502. Source: OSTI; NTIS; GPO Dep.

The Third Conference on Radiation Protection and Dosimetry was held during October 21–24, 1991, at the Sheraton Plaza Hotel in Orlando, Florida. This meeting was designed with the objectives of promoting communication among applied, research, regulatory, and standards personnel involved in radiation protection, and providing them with sufficient information to evaluate their programs. To meet these objectives, a technical program consisting of more than 75 invited and contributed oral presentations encompassing all aspects of radiation protection was prepared. General topics considered in the technical session included external dosimetry, internal dosimetry, instruments, accident dosimetry, regulations and standards, research advances, and applied program experience. In addition, special sessions were held to afford attendees the opportunity to make short presentations of recent work or to discuss topics of general interest. Individual reports are processed separately on the database.

19920 (ORNL/TM–11882-Absts.) **Third conference on radiation protection and dosimetry: Program and abstracts.** Oak Ridge National Lab., TN (United States). [1991]. 113p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. (CONF-911004–Absts.: 3. conference on radiation protection and dosimetry, Orlando, FL (United States), 21-24 Oct

1991). Order Number DE92011594. Source: OSTI; NTIS; INIS; GPO Dep.

This conference has been designed with the objectives of promoting communication among applied, research, regulatory, and standards personnel involved in radiation protection and providing them with sufficient information to evaluate their programs. To partly fulfill these objectives, a technical program consisting of more than 75 invited and contributed oral presentations encompassing all aspects of radiation protection has been prepared. General topics include external dosimetry, internal dosimetry, instruments, regulations and standards, accreditation and test programs, research advances, and applied program experience. This publication provides a summary of the technical program and a collection of abstracts of the oral presentations.

19921 (PNL–6450-51-HEDR) **Hanford Environmental Dose Reconstruction Project: Monthly report, January 1992.** Finch, S.M.; McMakin, A.H. (comps.). Pacific Northwest Lab., Richland, WA (United States). [1992]. 59p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE92011492. Source: OSTI; NTIS; GPO Dep.

The objective of the Hanford Environmental Dose Reconstruction Project is to estimate the radiation doses that individuals and populations could have received from nuclear operations at Hanford since 1944. The project is divided into the following technical tasks. These tasks correspond to the path radionuclides followed, from release to impact on humans (dose estimates): Source Terms, Environmental Transport, Environmental Monitoring Data, Demography, Food Consumption, and Agriculture, and Environmental Pathways and Dose Estimates.

19922 (PNL–6450-52-HEDR) **Hanford Environmental Dose Reconstruction Project: Monthly report.** Finch, S.M.; McMakin, A.H. (comps.). Pacific Northwest Lab., Richland, WA (United States). Feb 1992. 58p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE92013442. Source: OSTI; NTIS; GPO Dep.

19923 (PNL–7757-HEDR-Rev.1) **FY 1992 revised task plans for the Hanford Environmental Dose Reconstruction Project: Revision 1.** Shipler, D.B. Pacific Northwest Lab., Richland, WA (United States). Apr 1992. 127p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE92012141. Source: OSTI; NTIS; INIS; GPO Dep.

The purpose of the Hanford Environmental Dose Reconstruction (HEDR) Project is to estimate radiation doses from Hanford Site operations since 1944 to populations and individuals. The primary objectives of work to be performed in FY 1992 is to determine the appropriate scope (space, time, and radionuclides, pathways and individuals/population groups) and accuracy (level of uncertainty in dose estimates) for the project. Another objective is to use a refined computer model to estimate Native American tribal doses and individual doses for the Hanford Thyroid Disease Study (HTDS). Project scope and accuracy requirements defined in FY 1992 can translated into model and data requirements that must be satisfied during FY 1993.

19924 (RIVM–249102006) **Research into the radioactivity of surface waters: Results over 1990.** Sonderen, J.F. van; Drost, R.M.S.; Graber, M.H.; Ockhuizen, A.; Koolwijk, A.C. Rijksinstituut voor Volksgezondheid en Milieuhygiene, Bilthoven (Netherlands). Aug 1991. 32p. (In Dutch). Order Number DE92628044. Source: OSTI; NTIS (US Sales Only); INIS.

Includes summaries in Dutch and English.

This report of the National Institute of Public Health and Environmental Protection (RIVM) contains the results of measurements of radioactivity in the rivers Meuse, Rhine, Roer, in the Westerscheldt, in the Channel of Sas van Gent to Terneuzen, and at some specific locations in the North Sea along the Dutch Coast. The results concern samples taken in 1990. (author). 5 refs.; 8 figs.; 11 tabs.

19925 (SIS–1991:8) **Environmental contamination in the Kautokeino region.** Gjertsen, L. Statens Inst. for Straalehygiene, Oslo (Norway). 1991. 38p. (In Norwegian). Order Number DE92628047. Source: OSTI; NTIS (US Sales Only); INIS.

The National Institute of Radiation Hygiene of Norway has analysed the Cs-137 content in reindeer herdsmen by whole-body measurements with a NaI scintillation counter. The whole-body measurements started in Kautokeino in 1965 and were carried out in March every year until 1990. After the Chernobyl accident in 1986, the whole-body measurements included measurements of Cs-134 with half-life about 2 years. Cs-137 content in meat from legs of reindeer and Se-90 content in the corresponding bones were analysed by National Institute of Radiation Hygiene in the laboratory in Oslo. The samples were supplied by the group of reindeer herdsmen being measured. Also Se-90 content in reindeer meat samples was determined. Cs-137 and Sr-90 content in a few samples of lichens were analysed. 11 refs., 3 figs., 5 tabs.

19926 (SIS–1991:9) **Dose statistics for occupational exposure 1981 - 1990.** Woehni, T. Statens Inst. for Straalehygiene, Oslo (Norway). 1991. 18p. (In Norwegian). Order Number DE92628048. Source: OSTI; NTIS (US Sales Only); INIS.

The report contains annual dose statistics for occupational exposure in Norway for the years 1981 to 1990. For the dosimetry service at the National institute of radiation hygiene (SIS) the total collective dose registered by personal dosemeters has decreased from 5.5 mSv in 1981 to 3.7 mSv in 1990. The number of monitored workers has increased slightly in the same period, and represented in 1990 close to 6000 persons. The total result from the four dosimetry laboratories in Norway amounted in 1990 to approx. 7600 workers and a total registered collective dose of 4.6 mSv. These dose values refer to dosemeter readings as such, with no attempts made to estimate effective doses. Mean annual doses for 1990 ranged from 3.2 mSv for medical radiologists to 0.2 mSv for various industry and service activities within the SIS dosimetry service. The highest overall mean annual doses are 5.8 mSv for radiologists at the Norwegian Radium Hospital, followed by 3.7 mSv reported by the Institutt for energiteknikk in Halden. Trends in annual doses for various occupational groups are presented. 5 refs., 7 figs., 5 tabs.

19927 (SIS–1991:10) **Dietary survey and whole-body counting on reindeer herdsmen of Kautokeino 1989 and 1990.** Boee, E.; Soerlie, A.A. Statens Inst. for Straalehygiene, Oslo (Norway). 1991. 38p. (In Norwegian). Order Number DE92628046. Source: OSTI; NTIS (US Sales Only); INIS.

The dietary study revealed a group characterized by an especially high consumption of reindeer meat, almost 100 kg a year for women and about 150 kg on average for men. Average intake of radiocesium were calculated to 48000 and 39000 Bq by women and 76000 and 58000 Bq by men for the two years, respectively. Both for women and men this indicated a reduction of about 20% from 1989 to 1990. In 1990 samples of reindeer meet were collected for analysis of radiocesium. The average level of radiocesium in the samples were 350-400 Bq/kg. Norwegian Food Control Authorities recommended that individual intake of radiocesium should not exceed 80000 Bq/year, for pregnant and breast-feeding women not more than 40000 Bq/year. For the first year after the Chernobyl accident corresponding levels were set to 400000 and 80000 Bq, respectively. In 1989 42% of the men and 8% of the women had a calculated intake of radiocesium of more than 80000 Bq/year. In 1990 18% of the men and no women exceeded this level. None had an intake of 400000 Bq or more, the highest calculated intake was 162000 Bq. 10 refs., 5 figs., 11 tabs.

19928 (UCRL-CR–109261) **An epidemiologic study of unreported cutaneous malignant melanoma among residents of Alameda and Contra Costa Counties: Final report.** West, D.W. (Northern California Cancer Center, Belmont, CA (United States)); Whittemore, A.S.; Zippin, C.; Lum, D.; Holly, E. Lawrence Livermore National Lab., CA (United States); California Univ., San Francisco, CA (United States); Northern California Cancer Center, Belmont, CA (United States). 12 Nov 1991. 27p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. Order Number DE92011291. Source: OSTI; NTIS; GPO Dep.

Because of a reported excess of cutaneous malignant melanoma cases at the Lawrence Livermore National Laboratory during the 1970's this study was funded to: determine if the number of cases in Alameda and Contra Costa Counties may have been underreported during 1973–1985 (this is the comparison group used to report an excess of melanoma at the LLNL), and determine if melanoma cases at the LLNL had different melanomas from the comparison population in terms of tumor thickness and therefore aggressiveness of tumors. The results of these two objectives are reported in the form of two papers, each dealing with one of the objectives.

19929 (UWThPh–1991-29) **On the conformal field theory of the two dimensional Ising model.** Maderner, W. (Vienna Univ. (Austria). Inst. fuer Theoretische Physik). Vienna Univ. (Austria). Inst. fuer Theoretische Physik. 1991. 31p. Order Number DE92626055. Source: OSTI; NTIS (US Sales Only); INIS.

An explicit construction of a free and masseless Majorana quantum field theory, which lives on conformal superworld M is presented. Emphasis is posed on the investigation of the action of an infinite dimensional group G of space time symmetries on M. Starting with one particle theory, this action induces a strongly continuous representation of $\mathrm{Diff}^{\approx}{}_{+}(S^1)$ on the single particle Hilbert space. After second quantization the group of implementers turns out to be a non trivial central extension of $\mathrm{Diff}^{\approx}{}_{+}(S^1)$ by U(1), and a Schwinger term occurs, which gives rise to the anomalous transformation law of the energy momentum tensor of the theory. This transformation law is studied, and an interesting connection to geometry is established. (author).

19930 (UWThPh–1991-40) **Dynamical entropy of quantum systems and their abelian counterpart.** Narnhofer, H.; Thirring, W. Vienna Univ. (Austria). Inst. fuer Theoretische Physik. 23 Oct 1991. 18p. Order Number DE92625962. Source: OSTI; NTIS (US Sales Only); INIS.

We calculate the dynamical entropy of quasifree automorphisms by showing that their abelian counterpart already gives an optimal abelian model. (authors).

19931 (UWThPh–1991-62) **Quantum topological entropy: First steps of a 'pedestrian' approach.** Hudetz, T. (Vienna Univ. (Austria). Inst. fuer Theoretische Physik). Vienna Univ. (Austria). Inst. fuer Theoretische Physik. 13 Dec 1991. 27p. Order Number DE92625963. Source: OSTI; NTIS (US Sales Only); INIS.

We introduce a notion of topological entropy for automorphisms of arbitrary (noncommutative, but unital) nuclear C^*-algebras A, generalizing the 'classical' topological entropy for a homeomorphism $T: X \to X$ of an arbitrary (possibly connected) compact Hausdorff space X, where the generalization is of course understood in the sense that the latter topological dynamical system (with Z-action) is equivalently viewed as the C^*-dynamical system given by the T-induced automorphism of the Abelian C^*-algebra $A = C(X)$ of (complex-valued) continuous functions on X. As a simple but basic example, we calculate our quantum topological entropy for shift automorphisms on AF algebras A associated with topological Markov chains (i.e. 'quantum topological' Markov chains); and also a real physical interpretation of our simple 'quantum probabilistic' entropy functionals is discussed (already in the introduction, anticipating the later definitions and results). (author).

19932 (WSRC-OS–89-94-3) **F/H Area ETF effluent (H-016 outfall) ceriodaphnia survival/reproduction test, test date: December 28, 1989.** Specht, W.L. Westinghouse Savannah River Co., Aiken, SC (United States). Aug 1991. 16p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC09-89SR18035. Order Number DE92013097. Source: OSTI; NTIS; GPO Dep.

This toxicity test was conducted to determine if the effluent from the H/F area of Savannah River Plant affect the survival or reproduction of the test organisms during a seven day period. The test involved exposing the test organisms to a series of dilutions of the effluent. At each dilution the survival and reproduction of ten test organisms was recorded. Each effluent dilution was compared to a control set of test organisms. Survival data were analyzed by Fisher's Exact Test and Probit Analysis to determine the effluent concentration necessary to cause statistically significant ($p=0.05$) mortality. Reproduction data was analyzed for normality, homogeneity of variance and equality of replicates among dilutions to determine the appropriate statistical test for analysis of statistical differences in reproduction among dilutions. Results are summarized.

19933 (CONF-9105202–, pp. 16, Paper 4) **Static and animated molecular views of a tumorigenic chemical bond to DNA.** Broyde, S. (New York Univ., NY (United States)); Rong Xu; Hingerty, B.E.; O'Handley, S.F.; Krugh, T.R. USDOE Office of Energy Research, Washington, DC (United States). Scientific Computing Staff. [1991]. DOE Contract FG02-90ER60931 ;AC05-84OR21400. From 1. energy research power supercomputer users symposium; Gaithersburg, MD (United States); 21-22 May 1991. In *Proceedings of the first energy research power supercomputer users symposium.* 173p. Order Number DE91018877. Source: OSTI; NTIS; INIS.

Static and dynamic molecular views of a short segment of DNA modified by the tumorigenic aromatic amine 2-acetylaminofluorene (AAF) have been realized by a combination of high resolution nuclear magnetic resonance (NMR) studies in solution and molecular mechanics and molecular dynamics simulations carried out on supercomputers. Thus, the effect of AAF on the structure of the Watson-Crick B-DNA double helix has been elucidated, after two decades of intense interest, via a powerful synergy between state-of-the-art supercomputing and NMR investigations. The AAF is situated in the minor groove of a B-DNA double helix which flexes and bends, and the carcinogen moves between positions where it is stacked with adjacent DNA base and positions where it protrudes further into the groove. The AAF modified DNA base, guanine, is displaced from its normal situation paired with partner cytosine. Also, a base pair adjacent to the modification becomes more mobile. These molecular views offer some possible insight into the early molecular events that may implicate AAF in tumor initiation.

19934 (ETDE-mf–92516652) **Federal German forest survey.** Der Bundesminister fuer Ernaehrung, Landwirtschaft und Forsten informiert. Bundesministerium fuer Ernaehrung, Landwirtschaft und Forsten, Bonn (Germany). Jun 1990 14p. (In German). Order Number DE92516652. Source: OSTI; NTIS (US Sales Only).

On the whole, German forests present a satisfactory picture as to their types and structure. The forests are characterized by stands of spruce and fir, which account for some 43% of the area covered. Stands of pine and larch rank second with 22%. The 33% of area stocked with deciduous trees is essentially characterized by beech (17%) and oak (9%). A reliable survey of novel forest damage is possible only within a relatively short time-span. But the extensive measurements in the framework of the German forest inventory required a period of approximately three years. Therefore, forest damage will continue to be surveyed separately. (orig./VT).

19935 (ETDE-mf–92516820) **Polychlorinated biphenyls and nitrate in food analysed during initial phase of the research project 'German Food Contamination Monitoring Programme'. Progress report no. 14.** ZEBS-Hefte. Weigert, P.; Niermann, R.; Bruland, H.G.; Koenig, F. Bundesgesundheitsamt, Berlin (Germany). Zentrale Erfassungs- und Bewertungsstelle fuer Umweltchemikalien (ZEBS). 1991 105p. (In German). Order Number DE92516820. Source: OSTI; NTIS (US Sales Only).

Within the research project on the monitoring of foods involving 11 Laender of the Federal Republic of Germany (German Food Contamination Monitoring Programme), selected food items were examined for a number of residues and contaminants by the laboratories of official food control in collaboration with the Centre for

Surveillance and Health Evaluation of Environmental Chemicals of the Federal Health Office (ZEBS). In order to guarantee the comparability of analytical results among the 17 laboratories which have participated in the project until March 1990, particular efforts were taken to ensure the quality of analytical data and to harmonize the steps of sampling, sample preparation and recording of data. Samples of beef and pork including several organs, milk, potatoes, lettuce, white cabbage, strawberries and apples were taken according to strictly statistical aspects. Particular attention was paid to the possible seasonal influence on the contamination levels of the products. In the present report, an overview is given of the results obtained up to now for nitrate in foods of vegetal origin and for polychlorinated biphenyls in all food items included in the initial phase of the study. (orig./MG) With 15 tabs., 27 refs., 8 maps, annex with 30 tabs.

19936 (ORNL/TM–12029) **Characterization of explosives processing waste decomposition due to composting: Phase 2, Final report.** Griest, W.H.; Tyndall, R.L.; Stewart, A.J.; Ho, C.H.; Ironside, K.S.; Caton, J.E.; Caldwell, W.M.; Tan, E. Oak Ridge National Lab., TN (United States). 1 Nov 1991. 141p. Sponsored by Department of Defense, Washington, DC (United States). DOE Contract AC05-84OR21400. Order Number DE92013304. Source: OSTI; NTIS; GPO Dep.

Static pile and mechanically stirred composts generated at the Umatilla Army Depot Activity in a field composting optimization study were chemically and toxicologically characterized to provide data for the evaluation of composting efficiency to decontaminate and detoxify explosives-contaminated soil. Characterization included determination of explosives and 2,4,6,-trinitrotoluene metabolites in composts and their EPA Synthetic Precipitation Leaching Procedure Leachates, leachate toxicity to Ceriodaphnia Dubia and mutagenicity of the leachates and organic solvent extracts of the composts to Ames bacterial strains TA-98 and TA-100. The main conclusion from this study is that composting can effectively reduce the concentrations of explosives and bacterial mutagenicity in explosives – contaminated soil, and can reduce the aquatic toxicity of leachable compounds. Small levels of explosive and metabolites, bacterial mutagenicity, and leachable aquatic toxicity remain after composting. The ultimate fate of the biotransformed explosives, and the source(s) of residual toxicity and mutagenicity remain unknown.

19937 (ORO–2412-110) **Direct effects of energy-related air pollutants on plant sexual reproduction: Final report, February 1, 1979–January 31, 1982.** Ragsdale, H.L.; Murdy, W.H. Emory Univ., Atlanta, GA (United States). 8 Dec 1987. 12p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AS05-76EV02412. Order Number DE92011569. Source: OSTI; NTIS; GPO Dep.

Our completed research program concentrated on the direct in vivo effects of energy-related air pollutants on plant sexual reproduction. Direct air pollution effects on plant sexual reproduction have been studied for SO_2 and NO_2, two of the three major air pollutants.

19938 (WSRC-OS–89-94-2) **F/H Area ETF effluent (H-016 outfall) ceriodaphnia survival/reproduction test, test date: September 21, 1989.** Specht, W.L. Westinghouse Savannah River Co., Aiken, SC (United States). Aug 1991. 16p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC09-89SR18035. Order Number DE92011373. Source: OSTI; NTIS; GPO Dep.

This toxicity test was conducted to determine if the effluent from the F/H area of Savannah River Plant causes death (acute toxicity) or reduction in the reproduction of the test organisms (chronic toxicity) during a seven day period. A series of dilutions of the effluent are set to determine how much the effluent must be diluted before toxic effects are no longer noted. Acute toxicity is checked by statistically analyzing whether significantly more organisms die in the effluent dilutions than in the control treatment, and, if significantly more die, how much the effluent must be diluted so as to kill only 50% of the test organisms (the LC50). Chronic toxicity is checked by statistically analyzing whether significantly fewer young are produced by test organisms exposed to the effluent dilutions. Results indicate the lowest effluent concentration which shows a toxic effect (the LOEC) and the highest effluent concentration which does not demonstrate an effect (NOEC). Results are discussed.

19939 (ETDE-IT–92-23) **Noise control solutions in working environments: Data bank.** Benedetto, G.; Chiattella, A.; Guglielmone, C. Istituto Elettrotecnico Nazionale Galileo Ferraris, Turin (Italy). 1990. 7p. (In Italian). (CONF-9011285–1: Rumore e vibrazioni: valutazione, prevenzione e bonifica, Bologna (Italy), 20-21 Nov 1990). Order Number DE92506240. Source: OSTI; NTIS (US Sales Only).

This paper outlines the planning, by the Galileo Ferraris National Electrotechnical Institute of Italy, of an international noise control data bank which is intended to provide homogeneous and reliable information to assist researchers and designers in optimizing noise control measures to be implemented in the industrial and agricultural working environments. The compiled information is to be grouped into three categories - data on interventions regarding modifications to noise producing equipment, the sound-proofing of the equipment and working environment, protection of equipment operators through their donning of safety gear and modifications to the work routine. The data bank outline includes descriptions of noise control data sources and elaboration methods, as well as, descriptions of the required management software.

19941 (CONF-920761–8) **The effects of dissolved salts on oxygen and hydrogen isotope fractionation between water vapor and brines at 50–100°C.** Horita, J.; Wesolowski, D.J.; Cole, D.R. Oak Ridge National Lab., TN (United States). [1992]. 4p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. From 7. water-rock interaction conference; Park City, UT (United States); 9-23 Jul 1992. Order Number DE92010432. Source: OSTI; NTIS; GPO Dep.

A series of vapor-liquid water equilibration experiments were carried out in order to determine the effects of dissolved salts (NaCl, KCl, $MgCl_2$, $CaCl_2$, $MgSO_4$, Na_2SO_4, and their mixtures) on oxygen and hydrogen isotope activity ratios in brines at 50–100°C. NaCl, KCl and Na_2SO_4 have little or no effect on oxygen isotope activity ratios. However, oxygen isotope activity ratios in $CaCl_2$,

$MgCl_2$, and $MgSO_4$ solutions are significantly lower than their concentration ratios. In all of the salt solutions studied, hydrogen isotope activity ratios are appreciably higher than their concentration ratios. The isotope effects are all linear with the molalities of the solutions. Mixed salt solutions, including those mimicking natural brines, exhibit the isotope effects additive of those of individual salts. The isotope salt effects observed in this study have profound implications to isotope geochemistry.

19942 (CSNSM-T–88-01) **Study of the geochemistry of the cosmogenic isotope ^{10}Be and the stable isotope ^{9}Be in oceanic environment. Application to marine sediment dating.** Bourles, D. Paris-11 Univ., 91 - Orsay (France). Centre de Spectrometrie Nucleaire et de Spectrometrie de Masse. Jan 1988. 227p. (In French). Order Number DE92517879. Source: OSTI; NTIS (US Sales Only); INIS.

The radioisotope ^{10}Be is formed by spallation reactions in the atmosphere. It is transferred to the oceans in soluble form by precipitation and dry deposition. The stable isotope ^{9}Be comes from erosion of soils and rocks in the Earth's crust. It is transported by wind and rivers and introduced to the oceans probably in both soluble and insoluble form. ^{9}Be was measured by atomic absorption spectrometry and ^{10}Be by A.M.S. The distribution of ^{10}Be and ^{9}Be between each phase extracted and the ^{10}Be/^{9}Be ratios associated were studied in recent marine sediments from Atlantic, Pacific, Indian oceans and Mediterranean sea. The results show that for beryllium the two essential constituent phases of marine sediments are: - the authigenic phase incorporates the soluble beryllium and the detritic phase. The ^{10}Be/^{9}Be ratio associated with the authigenic fraction varies with location. This suggests that the residence time of beryllium in the soluble phase is lower or comparable to the mixing time of the oceans. The evolution with time of the authigenic ^{10}Be/^{9}Be ratio is discussed.

19943 (DOE/ER/14049–T1) **[Energy related studies utilizing microline thermochronology]: Progress report, 1990–1991.** California Univ., Los Angeles, CA (United States). [1991]. 12p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG03-89ER14049. Order Number DE92012239. Source: OSTI; NTIS; GPO Dep.

In our first year of the current funding cycle, we have investigated three interrelated aspects of K-feldspar thermochronology; (1) the Ar diffusion properties and microstructures of K-feldspars, (2) the thermal evolution of the Valles Caldera and (3) the continued development of microanalysis. Results of TEM and light microscopy on heated and unheated samples of MH-10 K-feldspar reveal three classes of substructure are present: (1) cross hatched extinction is common and there is almost no albite/pericline twinning, only tweed microstructure; (2) 5–10 vol. % of this K-feldspar are turbid zones with complex twin and tweed structures at the sub-micron scale and numerous dislocation and strain features; (3) about 20% of the K-feldspar is comprised of 0.01 x 0.2-1μm albite exsolution lamellae. The network of fractured/turbid zones divides the sample into blocks of approximately 50 μm and the separation between albite exsolution lamellae produce K-feldspar domains of the order 0.1 μm. Independent crushing and diffusion experiments suggest the scale of the largest domain is order ten's of micron whereas the smallest domain size is inferred to be ~0.1 μm. Many, and perhaps most, alkali feldspars contain diffusion domains with activation energies that may vary by as much as 8 kcal/mol. An extraordinary consequence of even relatively small variations in activation energy between domains is that the shape of an age spectrum can change dramatically by varying the laboratory heating schedule. We have performed ^{40}Ar/^{39}Ar age spectrum experiments on K-feldspar separated from Proterozoic quartz monzonite taken from a depth of 1.76 km down the VC-2B drill hole, Valles Caldera, north-central New Mexcio.

19944 (DOE/ER/14194–1) **Poroelasticity of rock: Progress report.** Wang, H.F. Wisconsin Univ., Madison, WI (United States). Dept. of Geology and Geophysics. Mar 1992. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG02-91ER14194. Order Number DE92012315. Source: OSTI; NTIS; GPO Dep.

The research program is an experimental study of static and dynamic poroelastic behavior of rocks. Measurements of Skempton's coefficient and undrained Poisson's ratio together with drained bulk modulus and shear modulus will provide a complete set of the four poroelastic moduli. Stress coupling to fluid flow in fractured rock can occur also through changes of fracture permeability due to fracture compressibility. Numerical models that include this effect will be compared with standard double porosity models of fluid extraction from oil reservoirs. Wave velocity and attenuation measurements will be made from seismic to ultrasonic frequencies to establish a phenomenological model of the effects of permeability, porosity and saturation for seismic exploration of oil and gas and for seismic characterization of an aquifer for environmental restoration and waste remediation.

19945 (DOE/ER/60319–T1) **[Support of the board on ocean science and policy].** National Research Council, Washington, DC (United States). Commission on Physical Sciences, Mathematics, and Resources. [1987]. 18p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG01-85ER60319. Order Number DE92011419. Source: OSTI; NTIS; GPO Dep.

The National Academy of Sciences, through the Ocean Studies Board of the Commission on Physical Sciences, Mathematics and Resources, proposes to provide guidance on major ocean sciences and policy issues to the National Oceanic and Atmospheric Administration, the National Science Foundation, the Department of the Navy, the US Geological Survey, the Minerals Management Service of the Department of the Interior, the US Coast Guard, the Department of State, the Department of Energy, The Environmental Protection Agency, and the National Aeronautics and Space Administration. The work plan for this activity is presented in the program plan section of this proposal. Work plans for subsequent years will be submitted prior to the commencement of work. Financial support is requested for continued support of the Ocean Studies Board activities from 1 June 1987 through 31 May 1989. Funds in the amount of $513,400 are requested for the period 1 June 1987 through 31 May 1988, as indicated in the attached estimate of costs.

19946 (DOE/ER/61013–2) **Mechanisms controlling the production and transport of methane, carbon dioxide, and dissolved solutes within a boreal peatland: Progress report, January 15, 1991–July 14, 1992.** Siegel, D.I. Syracuse Univ., NY (United States). 9 Apr 1992. 8p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG02-90ER61013. Order Number DE92011752. Source: OSTI; NTIS; GPO Dep.

Peatlands are one of the most important terrestrial reservoirs in the global cycle for carbon, and are a major source for atmospheric methane. However, little is known about the dynamics of these carbon reservoirs or their feedback mechanisms with the pool of atmospheric CO_2 during the Holocene. Specifically, it is unknown whether large peat basins are sources, sinks, or steady-state reservoirs for the global carbon cycle. In particular, the production and transport of methane, carbon dioxide, and dissolved organic carbon form the deeper portions of these peatlands is unknown. Our DOE research program is to conduct an integrated ecologic and hydrogeochemical study of the Glacial Lake Agassiz peatlands (northern Minnesota) to better understand the carbon dynamics in globally significant peat basins. Specifically, our study will provide local and regional data on (1), rates of carbon accumulation and loss and fluxes of methane in the peat profiles; (2) the physical and botanical factors controlling the production of methane and carbon dioxide in the wetland; and (3) the role of hydrogeologic processes in controlling the fluxes of gases and solutes through the peat. We intend to use computer simulation models, calibrated to field data, to scale-up from local to regional estimates of methane and carbon dioxide within the basin. How gases and dissolved organic carbon escapes form peatlands in unknown. It has been suggested that the concentrations of methane produced in the upper peat are sufficient to produce diffusion gradients towards the surface. Alternatively, gas may move through the peat profile by groundwater advection.

19947 (DOE/ER/61066–T1) **Parameterization of convective clouds, mesoscale convective systems, and convective-generated cirrus: Year 2 technical progress report, September 15, 1991–September 14, 1992.** Cotton, W.R. Colorado State

Univ., Fort Collins, CO (United States). Dept. of Atmospheric Science. 3 Mar 1992. 14p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG02-90ER61066. Order Number DE92010951. Source: OSTI; NTIS; GPO Dep.

A level 2.5w deep convection updraft/downdraft parameterization scheme has been refined and tested against 3D simulations of sea-breeze generated convection over S. Florida. Cases for explicit simulation of MCSs in mid-latitudes and tropics have been encouraging. After a few refinements in those cases, fine resolution explicit simualtions of deep convection and mesoscale, stratiform clouds will be begun.

19948 (DOE/ER/61202-1) **Steady-state and transient modeling of tracer and nutrient distributions in the global ocean: Progress report, June 1, 1991–March 31, 1992.** Stocker, T.F.; Broecker, W.S. Columbia Univ., Palisades, NY (United States). Lamont-Doherty Geological Observatory. 26 Mar 1992. 22p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG02-91ER61202. Order Number DE92011805. Source: OSTI; NTIS; GPO Dep.

The deep circulation model developed by Wright and Stocker has been used to represent the latitude-depth distributions of temperature, salinity, radiocarbon and "color" tracers in the Pacific, Atlantic and Indian Oceans. Restoring temperature and salinity to observed surface data the model shows a global thermohaline circulation where deep water is formed in the North Atlantic and in the Southern Ocean. A parameter study reveals that the high-latitude surface salinity determines the composition of deep water and its flow in the global ocean. Increasing Southern Ocean surface salinity by 0.4 ppt the circulation changes from a present-day mode where North Atlantic Deep Water is one where Antarctic Bottom Water is dominant. An inorganic carbon cycle with surface carbonate chemistry is included, and gas exchange is parameterized in terms of pCO_2 differences. Pre- industrial conditions are achieved by adjusting the basin-mean alkalinity. A classical $2\times CO_2$ experiment yields the intrinsic time scales for carbon uptake of the ocean; they agree with those obtained from simple box models or 3-dimensional ocean general circulation models. Using the estimated industrial anthropogenic input of CO_2 into the atmosphere the model requires, consistent with other model studies, an additional carbon flux to match the observed increase of atmospheric pCO_2. We use more realistic surface boundary conditions which reduce sensitivity to freshwater discharges into the ocean. In a glacial-to-interglacial experiment rapid transitions of the deep circulation between two different states occur in conjunction with a severe reduction of the meridional heat flux and sea surface temperature during peak melting. After the melting the conveyor belt circulation restarts.

19949 (NEI-NO-215) **A study of fluid-rock interactions during metamorphism.** Jamtveit, B. Oslo Univ. (Norway). Inst. for Geologi. 1990 120p. Order Number DE92506559. Source: OSTI; NTIS (US Sales Only).

This thesis comprises three papers: Fluid controlled eclogitization of granulites in deep crustal shear zones, Bergen Arcs, western Norway; Contact metamorphism of layered metasediments in the Oslo rift: Buffering, infiltration and the mechanisms of mass transport; Oscillatory zonation patterns in hydrothermal grossular - andradite garnets: Nonlinear behavior in regions of immiscibility. Each paper covers aspects of fluid-rock interactions during metamorphisms. The two first papers mainly focus on fluid controlled transport. The last paper discusses how the dynamics of a small system, a growing garnet, may be affected by external forcings controlled by large-scale fluid flow. 159 refs., 27 figs., 8 tabs.

19950 (NUREG/CR-5731) **Piedmont seismic reflection study: A program integrated with tectonics to probe the cause of eastern seismicity.** Glover, L. III (Virginia Polytechnic Inst. and State Univ., Blacksburg, VA (United States). Dept. of Geological Sciences); Coruh, C.; Costain, J.K.; Bollinger, G.A. Nuclear Regulatory Commission, Washington, DC (United States). Div. of Engineering; Virginia Polytechnic Inst. and State Univ., Blacksburg, VA (United States). Dept. of Geological Sciences. Mar 1992. 128p. Sponsored by Nuclear Regulatory Commission, Washington, DC (United States). Source: OSTI; NTIS; INIS; GPO.

A new tectonic model of the Appalachian orogen indicates that one, not two or more, terrane boundaries is present in the Piedmont and Blue Ridge of the central and southern Appalachians. This terrane boundary is the Taconic suture, it has been transported in the allochthonous Blue Ridge/Piedmont crystalline thrust nappe, and it is repeated at the surface by faulting and folding associated with later Paleozoic orogenies. The suture passes through the lower crust and lithosphere somewhere east of Richmond. It is spatially associated with seismicity in the central Virginia seismic zone, but is not conformable with earthquake focal planes and appears to have little causal relation to their localization.

19951 (UCRL-JC-104837) **Supercomputing and nonlinear seismic structural response of freeway structures.** Goudreau, G.L.; Kay, G.; McCallen, D.; Schauer, D.; Logan, R. Lawrence Livermore National Lab., CA (United States). Nov 1990. 4p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-9104355-1: 1991 American Society of Civil Engineers (ASCE) structures congress, Indianapolis, IN (United States), 29 Apr - 1 may 1991). Order Number DE92011460. Source: OSTI; NTIS; GPO Dep.

The Loma Prieta earthquake stimulated a major reassessment of Bay Area structures to consider much larger earthquakes than originally designed for. The supercomputers of the Lawrence Livermore National Laboratory were used to demonstrate the feasibility of nonlinear structural time history analysis to assess likelihood of failure of critical structures.

19952 (UCRL-JC-108315) **Statistical model for rock fracture.** Blair, S.C. (Lawrence Livermore National Lab., CA (United States)); Cook, N.G.W. Lawrence Livermore National Lab., CA (United States). 15 Jan 1992. 9p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-920634-11: 33. US symposium on rock mechanics, Santa Fe, NM (United States), 8-10 Jun 1992). Order Number DE92011527. Source: OSTI; NTIS; GPO Dep.

The mechanical behavior of rock in compression and at conditions appropriate to brittle behavior is controlled by the growth and coalescence of microcracks. This process depends on the disorder in the rock's microstructure due to the natural heterogeneity inherent in rocks. We are developing a statistical model that can incorporate microstructural heterogeneity for the study of fracture in rock and other heterogeneous materials. Our model uses (1) fracture-mechanics analysis to determine crack growth at a microstructural (grain) scale, (2) the concept of nearest-neighbor interaction, and (3) the techniques of percolation theory and self-organized criticality to evaluate crack interaction and coalescence, and the formation of fractures. The model is in the initial stages of development and this paper will describe the results of work in progress.

19953 (UCRL-JC-109501) **Intercomparison of global marine climatologies.** Grotch, S.L. Lawrence Livermore National Lab., CA (United States). Mar 1992. 8p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-9201100-1: International comprehensive ocean atmosphere data set (COADS) workshop, Boulder, CO (United States), 13-15 Jan 1992). Order Number DE92011389. Source: OSTI; NTIS; GPO Dep.

One of the major goals of the Program for Climate Model Diagnosis and Intercomparison at LLNL is the development and application of statistical/graphical methods for the intercomparison of GCMs among themselves and with observational data. Consequently, it is important to have available datasets that represent "current climate" and a range of tools with which to perform detailed intercomparisons. This work reports on an intercomparison of four historical climatologies for surface winds (focusing on zonal u-wind) and illustrates a variety of statistical/graphical tools that can be used to quantitatively determine the differences/similarities among these datasets.

19954 (USGS-OFR-91-105) **Aeromagnetic map of the Beatty quadrangle, Nevada-California.** Glen, J.M.; Ponce, D.A. Geological Survey, Menlo Park, CA (United States). 1991. 18p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AI08-78ET44802. Source: OSTI; INIS; US Geological

Survey, Books and Open-File Reports Section, Federal Center, Box 25425, Denver, CO 80225-0425.

An aeromagnetic map of the Beatty Quadrangle, Nevada-California has been prepared from six separate aeromagnetic surveys. This report contains the map. (JL)

19955 (SLAC-PUB-5732) **On the measuremnt of π.** Noyes, H.P. Stanford Linear Accelerator Center, Menlo Park, CA (United States). Feb 1992. 11p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC03-76SF00515. (CONF-9109360-1: 13. annual internationial meeting of the Alternative Natural Philosophy Association (ANPA), Cambridge (United Kingdom), 12-15 Sep 1991). Order Number DE92011582. Source: OSTI; NTIS; GPO Dep.

Inspired by Stillman Drake's definition of Galilean Units as those for which $[L/T^2 = (\pi^2/8)g]$ where g is any finite, constant acceleration measured in units of L and T, we construct a kinematical dimensional analysis based only on two universal, dimensionless constants. For the linear relation between L and T we use Einsteinian Units $L/= (1)c$. For orbiting masses negligible compared to some mass unit M, we use Keplerian Units based on his second law $[L^2/T = (1/2\pi)h/M]$. Then the unit for orbital angular momentum is $\hbar$, independent of the mass scale. This allows us to define dimensionless coupling constants $f^2 = \beta = v/c$ where v is the orbital velocity. We find that most of relativistic quantum mechanics requires only kinematical units. Dynamical units require a mass scale with universal significance, set by the orbital velocity $v = c$ (or $f^2 = 1$). In dimensional form this becomes $M = (1)[\hbar c/G]^{1/2}$. Assuming baryon number conservation, the fact that the proton is the lightest stable baryon allows us to calculate $\hbar c/Gm_p{}^2 \approx 1.7 \times 10^{38}$ as the Beckenstein number of the proton–the number of bits of information lost in its formation–and connects our units to the elementary particle mass scale.

What is the minimum energy dissipated per one step of logic operation? In the discussion, the device working on principles of irreversible logic was used. The dissipated energy was determined for two cases. As the first example a capacitor was discussed the charged and discharged states of which represents state 1 and 0, respectively. As the second example model was studied in which the logical states are represented by atoms sitting in the two potential minima of a potential double barrier. The results of determining the dissipated energy show that the relation (Landauer, R., IBM J. Res. Develop. 5, 183(1961)) which is very often cited, is not true for the quantum mechanical model. (Z.S.). 6 refs.

If attempts to describe, e.g., the low-lying spectrum of excitations of a molecule or a system of nucleons by means of a model which can be solved exactly (such as the harmonic oscillator) fail, perturbation theory can be tried. The anharmonic oscillator and the Rayleigh-Schroedinger perturbation series for energies are typical examples. Perturbation theory, however, fails as well if the bond constants are high. In practice, the Pade approximants method is convenient. Formulas in the form of infinite continued fractions are a particular case of this approach. (Z.S.). 8 refs.

A brief overview is presented of some basic experiments in the field of diffraction and interference of particles. It begins with electron microscopy, which enabled fundamental diffraction experiments with electrons to be performed. A prominent scientist dealing with this topic was Hans Boersch. In the early 1930's, Boersch made some projection electron microscopy studies that enabled him to observe Fresnel's diffraction effects, particularly on impermeable half-planes. Fresnel's zonal structure played an important part in the development of wave theory. Truly fundamental to wave theory, however, was Young's experiment, which was concerned with Fresnel's diffraction on two holes (slits). This experiment with electrons was carried out many times in the form of diffraction on two circular holes. (Z.S.). 3 figs., 11 refs.

In *Hadron structure '89: Proceedings of the conference.* Order Number DE92628522. Source: OSTI; NTIS (US Sales Only); INIS.

An essential constituent of integrable systems of Hamiltonian classical mechanics is the existence of a sufficient number of conserved quantities. The problem is to calculate them explicitly. A calculation procedure is presented for the integrable many-particle problem, where the starting point is not the corresponding Hamiltonian but a certain (fxf) matrix, where f is the finite number of degrees of freedom. The conserved quantities appear then as invariants of this matrix which can be obtained in a straightforward way. (Z.S.) 4 refs.

Suggestions have been made to treat the number of colors N_c in QCD as a large parameter and to use a $1/N_c$-expansion. A large number of degrees of freedom leads to the classical limit and simplifies the dynamics. This is true in the quantum mechanical problem as well; here in analogy to N_c the large parameter is $M=l+D/2$ (l is the angular momentum and D the number of space dimensions). The development of the 1/n-expansion of N is presented. In addition to the analogy with $1/N_c$, this expansion has useful applications in atomic physics and allows to compute the energy and width of resonances explicitly, including the strong coupling region. (Z.S.) 2 figs., 12 refs.

19963 (ITF–89-44) **Nonlocal boundary condition and zero modes of the Dirac operator on two-dimensional surface in magnetic field.** Mishchenko, A.V.; Sitenko, Yu.A. AN Ukrainskoj SSR, Kiev (Ukraine). Inst. Teoreticheskoj Fiziki. 1989. 21p. (In Russian). Order Number DE92627159. Source: OSTI; NTIS (US Sales Only); INIS.

Zero modes of the two-dimensional Dirac operator on compact and noncompact surfaces in an external static magnetic field are considered. For zero modes on a compact surface with boundary the nonlocal boundary condition which is equivalent to the square integrability condition for zero modes on a noncompact surface is performed. 16 refs.

19964 (ITP–89-43) **Quasi-Hopf algebras and Knizhnik-Zamolodchikov equations.** Drinfel'd, V.G. AN Ukrainskoj SSR, Kiev (Ukraine). Inst. Teoreticheskoj Fiziki. 1989. 16p. Order Number DE92627160. Source: OSTI; NTIS (US Sales Only); INIS.

The paper is a brief exposition of Drinfeld work. The notion of quasitriangular Hopf algebra is remained. The notion of quasitriangular quasi-Hopf algebra is introduced. A class of quasitriangular quasi-Hopf algebras using the differential equations for n-point functions in the WZW theory is constructed. Within the perturbation theory with respect to Planck's constant essentially all quasitriangular quasi-Hopf algebras belong to this class is asserted. A natural proof of Kohno's theorem on the equivalence of two kinds of braid group representations is given. Applications to knot invariants and the classical limit of various quantum notions are discussed. 16 refs.

19965 (KIYal–89-25) **Cross section simulation and determination of the average resonance parameters from experiments of transmission for filtered neutrons.** Novoselov, G.M.; Litvinskij, L.L.; Murzin, A.V. AN Ukrainskoj SSR, Kiev (Ukraine). Inst. Yadernykh Issledovanij. 1989. 19p. (In Russian). Order Number DE92627161. Source: OSTI; NTIS (US Sales Only); INIS.

A method of neutron cross section simulation on unresolved resonance region and its application for determination of nuclear average resonance parameters from transmission data on filtered neutrons are described. 15 refs.; 1 fig.

19966 (KIYal–89-30) **About one possibility of average neutron width estimation in unresolved resonance energy region.** Basenko, V.K.; Litvinskij, L.L.; Prokopets, G.A.; Purtov, O.A. AN Ukrainskoj SSR, Kiev (Ukraine). Inst. Yadernykh Issledovanij. 1989. 14p. (In Russian). Order Number DE92627162. Source: OSTI; NTIS (US Sales Only); INIS.

The method of experimental study of total cross-sections resonance structure in unresolved energy region is described. Proposed method is based on the measuring of transmissions by samples of neutrons, scattered by another sample of the same material on various angles. The results of model experiments and approciable experiment on Co-59 and filtered reactor neutron beam are presented. 3 refs.; 10 figs.

19967 (SLAC-PUB–5752) **The RQM triangle: A paradigm for relativistic quantum mechanics.** Noyes, H.P. Stanford Linear Accelerator Center, Menlo Park, CA (United States). Feb 1992. 12p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC03-76SF00515. (CONF-9202100–1: 8. annual Western regional meeting of the Alternative Natural Philosophy Association (ANPA), Stanford, CA (United States), 15-17 Feb 1992). Order Number DE92011583. Source: OSTI; NTIS; INIS; GPO Dep.

A simple way to relate Lorentz transformations to a finite and discrete model of counter firings is presented. We first abstract from counter firings with finite resolution to rational fraction velocities and a finite step-length. Discrete Lorentz transformations and quantized rotations follow. These are encoded by three integers and a triangle with integer sides: the RQM Triangle. The double slit experiment allows us to observe quantized space steps and measure invariant step lengths for any particle in rational ratio to one such length for any convenient reference particle. A discrete version of the Mandelstam analysis of elastic and anelastic scattering is implied. The results fit naturally into the bit-string formalism used in earlier work.

19968 (ETDE-IT–92-24) **Magnesium atomic beam frequency standard with optical pumping.** Godone, A. Istituto Elettrotecnico Nazionale Galileo Ferraris, Turin (Italy). 1990. 10p. (In Italian). (CONF-9009490–: Prospettive delle misure elettriche ed elettroniche, Padua (Italy), 20-22 Sep 1990). Order Number DE92506286. Source: OSTI; NTIS (US Sales Only); INIS.

Optical pumping of the metastable states of magnesium was conducted in a thermal atomic beam with the use of coherent radiation in P3(3s3p)-S3(3s4s) visible transition resonance. The application of this technique allowed the experimental demonstration of the possibility of immediately increasing the short term stability of the sample by one order of size and then by two orders of size in a subsequent phase. This appears to suggest the feasibility of a magnesium 24 frequency sample with which an accuracy comparable with that of cesium 133 can be obtained and whose stability approaches that of maser-H.

19969 (KIYal–89-22) **On production and acceleration of polarized heavy ions at tandem electrostatic accelerator (TEA).** Aushev, V.E.; Zaika, N.I.; Magal', M.I.; Totskij, Yu.I.; Khudenko, A.Ya. AN Ukrainskoj SSR, Kiev (Ukraine). Inst. Yadernykh Issledovanij. 1989. 19p. (In Russian). Order Number DE92627209. Source: OSTI; NTIS (US Sales Only); INIS.

The possibilities of polarized experiments with heavy ions on TEA at terminal voltage 7.5MV are discussed. The scheme of polarized ion source (PIS) of ^{14}N and its injection into the accelerator is described. The data energies at accelerator output and target nucleus maximum charges for nuclear reactions of above Coulomb barrier were obtained. The optics of ion movement from PIS to the target and spin dynamics calculation results of ^{14}N ions moving in the same channel on axial and the most remote side trajectory is analyzed. The most suitable variants of transportation and acceleration of polarized heavy ions for providing the measurement optimal conditions in target were determined. 12 refs.; 3 figs.; 3 tabs.

19970 (CONF-8912170–1) **A finite element solver for the Maxwell equations.** Loehner, R. (George Washington Univ., Washington, DC (United States)); Ambrosiano, J. Lawrence Livermore National Lab., CA (United States). [1989]. 16p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. From GAMNI-SMAI conference on numerical methods for the Maxwell equations; Paris (France); Dec 1989. Order Number DE92012187. Source: OSTI; NTIS; GPO Dep.

We present several solvers for the Maxwell equations based on unstructured grids. Numerical experiments, intended to quantify the performance of these schemes, reveal that they are very accurate. Grid adaptation in the form of remeshing is applied to radar cross-section problems, and found to be a very effective tool.

19971 (DOE/ER/14176–T1) **Knot invariants and the thermodynamics of lattice gas automata: Technical progress report, 15 May 1991–14 April 1992.** Meyer, D.A. California Univ., San Diego, La Jolla, CA (United States). Inst. of Pure and Applied Physical Sciences. [1992]. 4p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG03-91ER14176. Order Number DE92011853. Source: OSTI; NTIS; INIS; GPO Dep.

The goal of this project is to build on the understanding of the connections between knot invariants, exactly solvable statistical mechanics models and discrete dynamical systems that we have gained in earlier work, toward an answer to the question of how early and robust thermodynamic behavior appears in lattice gas automata.

19972 (LA-UR–92-296) **Wavenumbers for currents on infinite- and finite-length wires in a chiral medium.** Bhattacharyya, A.K. (New Mexico State Univ., Las Cruces, NM (United States)); Burke, G.J.; Miller, E.K. Los Alamos National Lab., NM (United States). [1992]. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-920750–2: Institute of Electrical and Electronic Engineers-American Physical Society (IEEE-APS) international symposium, Chicago, IL (United States), 18-25 Jul 1992). Order Number DE92007565. Source: OSTI; NTIS; GPO Dep.

There is increasing interest in determining the electromagnetic properties of material media differing from free space and the effects thereof on the radiation, propagation, and scattering of electromagnetic fields. A material property of special present interest is that of chirality. Chirality manifests itself as a "handedness" wherein a chiral medium does not support propagation of a linearly-polarized plane wave, but which instead decomposes into two circularly-polarized waves that propagate at different speeds. Initial work in this area was devoted to developing various analytical solutions to some basic problems such as the Green's Dyadic for a point current source. Attention is now being increasingly devoted to using this early work for a variety of applications such as analyzing antennas in chiral media scattering from chiral objects; scattering from objects having chiral coatings; and reflection from planar chiral interfaces. The focus of the work described here is determining the wavenumbers $(=-\alpha-j\beta)$ of the current waves excited on wire antennas located in an infinite chiral medium using two complementary approaches. One is to use an extension of an existing computer model (NEC) that permits modeling of arbitrary wire objects located in an infinite chiral medium. The other is to develop a solution for an infinitely long cylindrical antenna also located in an infinite chiral medium. The latter canonical problem is of interest in its own right as well as providing a means for achieving mutual validation with the NEC model. 9 refs.

19973 (LA-UR–92-845) **A linear and nonlinear study of Mira.** Cox, A.N. (Los Alamos National Lab., NM (United States)); Ostlie, D.A. Los Alamos National Lab., NM (United States). [1991]. 16p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-9107218–1: International Astronomical Union (IAU) conference on nonlinear phenomena in stellar variability, Buenos Aires (Argentina), 23 Jul - 1 aug 1991). Order Number DE92011265. Source: OSTI; NTIS; GPO Dep.

Both linear and nonlinear calculations of the 331 day, long period variable star Mira have been undertaken to see what radial pulsation mode is naturally selected. Models are similar to those considered in the linear nonadiabatic stellar pulsation study of Ostlie and Cox. Models are considered with masses near one solar mass, luminosities between 4000 and 5000 solar luminosities, and effective temperatures of approximately 3000 K. These models have fundamental mode periods that closely match the pulsation period of Mira. The equation of state for the stellar material is given by Stellingwerf procedure, and the opacity is obtained from a fit by Cahn that matches the low temperature molecular absorption data for the Population I Ross-Aller 1 mixture calculated from the Los Alamos Astrophysical Opacity Library. For the linear study, the Cox, Brownlee, and Eilers approximation is used for the linear theory variation of the convection luminosity. For the nonlinear work, the method described by Ostlie and Cox is followed. Results showing internal details of the radial fundamental and first overtone modes behavior in linear theory are presented. Preliminary radial fundamental mode nonlinear calculations are discussed. The very tentative conclusion is that neither the fundamental or first overtone mode is excluded from being the actual observed one.

19974 (LA-UR–92-861) **Radial and nonradial periods and growth rates of an AI Velorum model.** Guzik, J.A. Los Alamos National Lab., NM (United States). [1992]. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-920184–3: International Astronomical Union (IAU) meeting, Mito (Japan), 6-10 Jan 1992). Order Number DE92011369. Source: OSTI; NTIS; GPO Dep.

Walraven, Walraven, and Balona recently discovered several new periodicities in addition to the well-known fundamental and first overtone periods of the high-amplitude δ Scuti star AI Velorum. Linear nonadiabatic pulsation calculations were performed for an AI Velorum model of mass 1.96 $M_{\odot}$, 24.05 $L_{\odot}$, and T_{eff}7566 K for the radial and low-degree nonradial modes to help verify the tentative identifications made by Walraven, et al. Comparison of the calculated periods with the observations suggests some alternatives to the identifications proposed by Walraven, et al.

19975 (LA-UR–92-879) **Nonlinear RR Lyrae models with new Livermore opacities.** Guzik, J.A.; Cox, A.N. Los Alamos National Lab., NM (United States). [1992]. 4p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-920184–2: International Astronomical Union (IAU) meeting, Mito (Japan), 6-10 Jan 1992). Order Number DE92011158. Source: OSTI; NTIS; GPO Dep.

A.N. Cox recently showed that a 20% opacity decrease in the 20,000–30,000 K region as indicated by the new Livermore OPAL opacities reconciles the discrepancy between pulsation and evolution masses of double-mode RR Lyrae variables. Nonlinear hydrodynamic calculations were performed for RR Lyrae models of mass 0175 M$\odot$, 51 L$\odot$, and $Z=0.0001$ including this opacity decrease. The Stellingwerf periodic relaxation method was used to converge the models to a limit cycle, and the Floquet matrix eigenvalues calculated to search for a tendency of the fundamental mode to grow from the full-amplitude overtone solution, and the overtone mode to grow from the full-amplitude fundamental solution, thereby predicting double-mode behavior. Models of $T^{eff} < 7000$ K with the opacity decrease have positive fundamental-mode growth rates in the overtone solution, in contrast to earlier results by Hodson and Cox, and models with $T_{eff} < 7000$ have positive 1st overtone growth rates in the fundamental-mode behavior was not found.

19976 (SAND–91-2910C) **Modeling arbitrarily directed slots that are narrow both in width and depth with regard to the FDTD spatial cell.** Riley, D.J.; Turner, C.D. Sandia National Labs., Albuquerque, NM (United States). [1991]. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-76DP00789. (CONF-920750–3: Institute of Electrical and Electronic Engineers-American Physical Society (IEEE-APS) international symposium, Chicago, IL (United States), 18-25 Jul 1992). Order Number DE92008015. Source: OSTI; NTIS; GPO Dep.

The Hybrid Thin-Slot Algorithm (HTSA) integrates a transient integral-equation solution for an aperture in an infinite plane into a finite-difference time-domain (FDTD) code. The technique was introduced for linear apertures and was extended to include wall loss and lossy internal gaskets. A general implementation for arbitrary thin slots is briefly described here. The 3-D FDTD-code TSAR was selected for the implementation. The HTSA does not provide universal solutions to the narrow slot problem, but has merits appropriate for particular applications. The HTSA is restricted to planar slots, but can solve the important case that both the width and depth of the slot are narrow compared to the FDTD spatial cell. IN addition, the HTSA is not bound to the FDTD discrete spatial and time increments, and therefore, high-resolution solutions for the slot physics are possible. The implementation of the HTSA into TSAR is based upon a "slot data file" that includes the cell indices where the desired slots are exist within the FDTD mesh. For an HTSA-defined slot, the wall region local to the slot is shorted, and therefore, to change the slot's topology simply requires altering the file to include the desired cells. 7 refs.

19977 (SAND–92-0390C) **Massively parallel solutions for the modeling of complex electromagnetic systems.** King, A.S.;

Lee, C.E. Sandia National Labs., Albuquerque, NM (United States). [1992]. 6p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-76DP00789. (CONF-9206139–1: C31 technology and applications, Rome, NY (United States), 1-4 Jun 1992). Order Number DE92010959. Source: OSTI; NTIS; GPO Dep.

Many applications of national importance require the design, analysis, and simulation of complex electromagnetic phenomena. These applications range from the simulation of synthetic aperture radar to the design and analysis of low-observable platforms, antenna design, and automatic target recognition. In general, the modeling of complex electromagnetic phenomena requires significant amounts of computer time and capacity on conventional vector supercomputers but takes far less on massively parallel computers. Sandia National Laboratories is currently developing massively parallel methods and algorithms for the characterization of complex electromagnetic phenomena. The goal of on going research at Sandia is to understand the characteristics, limitations, and trade-offs associated with complex electromagnetic systems including: modeling the seeker response to complex targets in clutter, calculating the radiation and scattering from conformal communication and radar system antennas, and the analysis and design of high speed circuitry. By understanding the theoretical underpinnings of complex electromagnetic systems it is possible to achieve realistic models of system performance. The first objective is the development of computationally practical, high fidelity, systems models targeted for massively parallel computers. Research to achieve this objective is conducted in such areas as mathematical algorithms, problem decomposition, inter-processor communication schemes, and load balancing. The work in mathematical algorithms includes both the development of new methods and the parallel implementation of existing techniques. The second objective is the application of these high fidelity models to facilitate a better understanding of systems level performance for many C^3I platforms. This presentation describes applications of much current interest and novel solution techniques for these applications utilizing massively parallel processing techniques.

19978 (TRITA-EPP–91-03) **A numerical model of ionospheric convection derived from field-aligned currents and the corresponding conductivity.** Blomberg, L.G.; Marklund, G.T. Royal Inst. of Tech., Stockholm (Sweden). Dept. of Plasma Physics. Aug 1991. 31p. Order Number DE92627927. Source: OSTI; NTIS (US Sales Only); INIS.

Supersedes TRITA-EPP–88-03.

A numerical model for the calculation of ionospheric convection patterns from given distributions of field-aligned current and ionospheric conductivity is described. The model includes a coupling between the conductivity and the field-aligned current, so that the conductivity peaks in regions of upward current, as is usually observed by measurements. The model is very flexible in that the input distributions, the field-aligned current and the conductivity, have been parametrized in a convenient way. From the primary model output, namely the ionospheric electrostatic potential (or convection) in the corotating frame, a number of other quantities can be computed. These include; the potential in the inertial frame (the transformation takes into account the non-alignment of the Earths magnetic and geographic axes), the potential in the magnetospheric equatorial plane (projected using either a dipole magnetic field model or the Tsyganenko-Usmanov model, and the assumption of either vanishing parallel electric field or a proportionality between parallel potential and upward field-aligned current), the distribution of ionospheric (horizontal) current, and the Joule heating in the ionosphere. This model has been used together with a new snapshot technique to calculate the high-latitude potential distribution prevailing during a particular event by combining information from global auroral images and local measurements of fields and particles. The model potential variation along the satellite orbit was found to be in excellent agreement with that calculated from the measured electric field. The model has also been used to study some fundamental properties of the electrodynamics of the high-latitude ionosphere. The results of these different applications of the model have been published separately. (au) (39 refs.).

19979 (UCRL-CR–110002) **Ionospheric communications channel modelling.** Bahr, R.K. (Arizona Univ., Tucson, AZ (United States). Dept. of Electrical and Computer Engineering); Ward, B.R. Lawrence Livermore National Lab., CA (United States). Feb 1992. 40p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. Order Number DE92013039. Source: OSTI; NTIS; GPO Dep.

The general scope of this work has been to investigate "Ionospheric Communications Channel Modeling." Specifically, we have developed a simple model to study the detection and time-of-arrival (TOA) estimation of an earth-based, transient electromagnetic pulse by a satellite-borne receiver. The complete channel model divides naturally into four parts: the electromagnetic pulse signal model, the ionospheric propagation mode, the noise model, and the detector/TOA estimator. The model described in this report is admittedly very crude. Numerous simplifications and outright omissions have been made. Nevertheless, we hope that the contents herein will provide a sufficient basis should an interested researcher wish to pursue the study of transient pulse detection and estimation. Below each of the four sub-models is detailed. We alert the reader to some of the simplifications/omissions made in the model development. It will become clear that to produce a highly accurate ionospheric communications channel model is indeed a substantial undertaking. 11 refs.

19980 (UCRL-JC–103243-Rev.2) **Plane stokes flow driven by capillarity on a free surface: Overview and status: Revision 2.** Hopper, R.W. Lawrence Livermore National Lab., CA (United States). 25 Oct 1991. 6p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-900684–1-Rev.2: 5. international colloquium on free boundary problems: theory and applications, Montreal (Canada), 13-22 Jun 1990). Order Number DE92011469. Source: OSTI; NTIS; GPO Dep.

This article summarizes some recent work on the creeping viscous incompressible plane flow in a region, bounded by a simple smooth closed curve and driven solely by surface tension. Such problems are self-contained in that the applied tractions are intrinsic in the geometry. The objective is to determine exactly the time evolution of the shape of the region. The problems are fundamentally nonlinear due to the large changes in shape, and it is emphasized that no mathematical approximations are made. For finite regions, the shape in the complex z-plane is described in terms of a time-dependent conformal mapping function $\Omega(\zeta, t)$ on the fixed region $|\zeta| \leq 1$ of the complex ζ-plane. In practice, it has been necessary to conjecture an explicit parametric form $\Omega[\zeta;\alpha_1(t), \alpha_2(t), \cdots]$ whose validity must be verified using the shape- evolution equation. Suitable parameterizations are not always obvious. When the conjectured form holds and the equations can be solved, the evolution of the shape with time is obtained in simple, exact and closed form except for the value of the time, which requires a mere quadrature. Internal velocity and stress fields can be obtained.

19981 (UCRL-JC–104580) **Localized transmission of acoustic beam energy.** Lewis, D.K. Lawrence Livermore National Lab., CA (United States). Dec 1990. 4p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-901202–2: Ultrasonics symposium, Honolulu, HI (United States), 5-7 Dec 1990). Order Number DE92011522. Source: OSTI; NTIS; GPO Dep.

Recent experiments have shown that it is possible to create a pulsed beam of acoustic energy which maintains amplitude and beam width better than either conventional single frequency or wideband beams of comparable frequency content. This presentation describes work done at LLNL in the design and generation of these localized wave transport beams. The experimental techniques to date have included acousto-optics, two transducer linear superposition and arrays compared to individually addressable elements. The beam width, amplitude and frequency spectra of the localized beams are compared to those of both single frequency tone burst piston beams and wide band Gaussian beams. An overview of the theory will be given and proposed applications discussed.

19982 (UCRL-JC–107443) **Calculational prediction of ultra-wideband electromagnetic pulses by laser-initiated air avalanche switches.** Mayhall, D.J.; Yee, J.H. Lawrence Livermore National Lab., CA (United States). Dec 1991. 17p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-920124–21: Society of Photo-Optical

Instrumentation Engineers' international symposium on laser spectroscopy as part of SPIE's symposium on optics, electro-optics and laser applications in science and engineering, Los Angeles, CA (United States), 1 Order Number DE92011732. Source: OSTI; NTIS; GPO Dep.

The gas avalanche switch is a recently conceived, laser-activated, high-voltage, picosecond-speed switch. It basically consists of a set of pulse-charged electrodes immersed in a gas at high-pressure (2–800 atm). A picosecond-scale laser pulse initiates an avalanche discharge in the gas between the electrodes. With the proper configuration, the avalanche, which is fueled by the immense number of electrons available in the gas, causes the applied voltage to collapse in picoseconds and generates electromagnetic waves. A two-dimensional electron fluid computer code solves Maxwell's curl equations and a set of electron fluid equations for transverse magnetic modes in air between parallel plane conductors. Collision frequencies for ionization and momentum and energy exchange to neutral molecules are taken to scale directly with neutral pressure. Calculations are performed for a Blumlein pulse generator geometry, featuring a charged rectangular center electrode between grounded parallel plates spaced 2 mm apart. In one mode of operation, initial electrons are induced in the lower air gap, the gap between the center electrode and the lower plate. At 292 kV on the center electrode, 27 atm pressure, and uniform ionization under the full width of the center electrode, induced voltage pulses of 300 kV, 2.4 ps rise time, 9.1 ps full width at half maximum (FWHM), 38 ps duration, and 22 GHz bandwidth at 3 dB occur at the ends of the parallel plates. Reduction of the initial electron number over eleven orders of magnitude has very little gross effect on these pulses. Concentration of the initial electrons into a narrow, centered column generally results in reductions in rise time, FWHM, and pulse duration, as well as increases in peak voltage. Movement of the narrow column to the extreme left of the center electrode causes the voltage pulses at the left and right sides of the parallel plates to differ somewhat in their characteristics. 10 refs.

19983 (UCRL-JC–109222) **Heating and momentum deposition in hot stars.** Castor, J.I. Lawrence Livermore National Lab., CA (United States). Dec 1991. 16p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-9107218–2: International Astronomical Union (IAU) conference on nonlinear phenomena in stellar variability, Buenos Aires (Argentina), 23 Jul - 1 aug 1991). Order Number DE92011850. Source: OSTI; NTIS; GPO Dep.

The coronae of hot stars are compared with those of the sun and other cool stars, and some important distinctions are drawn. Principal among these are that the hot star coronae readily radiate away any deposited energy, and that the overriding concern is how the momentum is deposited that drives their very vigorous winds. The features of radiatively driven winds are reviewed, with particular attention to their evidently very complex, and presently poorly known, spatial and temporal structure. Some possible explanations for the structure are considered.

19984 (UCRL-JC–109859) **X-ray transfer.** Castor, J.I. Lawrence Livermore National Lab., CA (United States). Mar 1992. 13p. Sponsored by USDOE, Washington, DC (United States); National Aeronautics and Space Administration, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-9202103–1: 10. international colloquium on ultra violet and x-ray spectroscopy of astrophysical and laboratory plasmas, Berkeley, CA (United States), 3-5 Feb 1992). Order Number DE92011961. Source: OSTI; NTIS; GPO Dep.

The computational techniques for treating radiative transfer in general, and x-ray transfer in particular, are reviewed, with emphasis on the difficult problems associated with systems that are not in local thermodynamic equilibrium. Some special aspects of x-ray transfer are mentioned. The computer code ALTAIR, developed at LLNL to solve such problems, is described briefly, with an example of x-ray fluorescence in a Seyfert galaxy. Some of the prospects for experimental tests of x-ray radiative transfer theory are considered.

19985 (UCRL-JC–110087) **Resonant Compton scattering in models of gamma-ray burst sources.** Vitello, P.A. Lawrence Livermore National Lab., CA (United States). Jan 1992. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-9110310–4: Gamma ray burst conference, Huntsville, AL (United States), 17-18 Oct 1991). Order Number DE92010720. Source: OSTI; NTIS; GPO Dep.

We consider here the spectra produced from the resonant Compton scattering of blackbody and power-law photons by a beam of relativistic electrons/positrons. The beam is assumed to be directed radially outward along the magnetic axis of a highly magnitized neutron star. We assume a dipole magnetic field geometry, and include the effects of magnetic Compton scattering energy losses on the particles in the beam during transport. A range of surface intensities for a magnetic field of 2×10^{12} Gauss are studied for a power-law electron/positron source functions of index Γ. The calculated scattered photon spectra are similar to observed gamma-ray burst spectra with a spectral index α which breaks from $\alpha \simeq 1$ to $\alpha \simeq \Gamma$.

19986 (UCRL-JC–110303) **Modeling of uv lines from cataclysmic variable winds.** Vitello, P.A. (Lawrence Livermore National Lab., CA (United States)); Shlosman, I. Lawrence Livermore National Lab., CA (United States). Mar 1992. 6p. Sponsored by USDOE, Washington, DC (United States); National Aeronautics and Space Administration, Washington, DC (United States). DOE Contract W-7405-ENG-48. Grant NAG5-1387. (CONF-9202103–2: 10. international colloquium on ultra violet and x-ray spectroscopy of astrophysical and laboratory plasmas, Berkeley, CA (United States), 3-5 Feb 1992). Order Number DE92013443. Source: OSTI; NTIS; GPO Dep.

Ultraviolet resonance lines appear to be powerful tools for diagnostics and study of the outflows from cataclysmic variable stars. The origin of these winds and their geometry are not known at present. In order to compare observed lines from the IUE database with synthetic line profiles from accretion disk winds, we have developed a numerical radiation transfer model for 3D non-radial, rotating winds from an accretion disk. Using this model we have studied line spectra from a number of cataclysmic variables. We find that good fits to be observed spectra can be obtained using disk winds for mass loss rates much smaller than the accretion rates.

The application of standard particle physics techniques to cosmological and astrophysical questions has given rise to an exciting new area of physics research known as particle astrophysics. In the discussion which follows, the author summarizes some of the key elements of this research area and indicates some of the experimental directions in which one might see some progress as new experimental facilities are brought on line over the course of the next several years.

19989 (DESY–91-152) **Scaling behaviour of small volume physics in SU(2) lattice gauge theory.** Gutbrod, F. Deutsches Elektronen-Synchrotron (DESY), Hamburg (Germany). Dec 1991. 16p. (HLRZ–97/91). Order Number DE92516964. Source: OSTI; NTIS (US Sales Only); INIS.

A factor 2 scaling test for masses, derived from the correlation function of Polyakov loops, has been performed on physically small lattices with high precision. The test has been made at $\beta = 2.9$ and $\beta = 3.0$, comparing masses on lattices of size $16^3 \times 128$ and $16^3 \times 192$ resp. with masses on half sized lattices. Results for $\Delta\beta$ are significantly higher than those obtained by MCRG methods, by Creutz ratios and by the string tension on larger lattices. They are almost compatible with asymptotic scaling. (orig.).

19990 (DESY–92-006) **Unconstrained SU(2) and SU(3) Yang-Mills classical mechanics.** Dahmen, B. (Hamburg Univ. (Germany). 2. Inst. fuer Theoretische Physik); Raabe, B. Deutsches Elektronen-Synchrotron (DESY), Hamburg (Germany). Jan 1992. 31p. Order Number DE92517041. Source: OSTI; NTIS (US Sales Only); INIS.

A systematic study of contraints in SU(2) and SU(3) Yang-Mills classical mechanics is performed. Expect for the SU(2) case with spatial angular momenta they turn out to be nonholonomic. The complete elimination of the unphysical gauge and rotatinal degrees of freedom is achieved using Dirac's constraint formalism. We present an effective unconstrained formulation of the general SU(2) Yang-Mills classical mechanics as well as for SU(3) in the subspace of vanishing spatial angular momenta that is well suited for further explicit dynamical investigations. (orig.).

19991 (DESY–92-015) **Self-organizing criticality, large anomalous mass dimension and the gauge hierarchy problem.** Bornholdt, S.; Wetterich, C. Deutsches Elektronen-Synchrotron (DESY), Hamburg (Germany). Feb 1992. 14p. Order Number DE92517043. Source: OSTI; NTIS (US Sales Only); INIS.

Fermions and scalars contribute with opposite sign to the dependence of the scalar mass term m^2 on the length scale k^{-1}. We discuss the possibility that a "balance effect" between these contributions leads to an infrared stable fixpoint in the evolution of the ratio $m^2(k)/k^2$. Such a behavior would result in self-organizing critically and could naturally explain a small gauge hierarchy. It is closely related to a large anomalous mass dimension. (orig.).

19992 (DOE/ER/40107–11(B)) **Research in particle physics beyond the standard model (Task B): Final report, July 1, 1983–January 15, 1992.** Samuel, S. City Coll., New York, NY (United States). Dept. of Physics. [1992]. 18p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-83ER40107. Order Number DE92012240. Source: OSTI; NTIS; INIS; GPO Dep.

During the DOE funding period from 1987 to 1991 for Task A, research was carried out in fundamental particle physics in the areas of string field theory, string phenomenology, physics beyond the standard model and TEV physics. During this five year period more than 40 articles were published, including contributions to conference proceedings. The overall performance should be regarded as highly successful. The proposed research projects were either discovered to be not feasible to carry out or were successfully completed within a six month period. More than 50% of the proposed projects fell into the later category. In addition, many projects were successfully achieved that were not part of DOE proposals, simply because they could not be foreseen. Here is a summary of the research.

19993 (DOE/ER/40628–1) **[Studies in quantum field theory: Progress report, April 1, 1991–March 31, 1992].** Bender, C.M. Washington Univ., St. Louis, MO (United States). Dept. of Physics. [1992]. 70p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG02-91ER40628. Order Number DE92011035. Source: OSTI; NTIS; INIS; GPO Dep.

Professors Bender, Bernard, and Shrauner, Assistant Professors Ogilvie and Goltermann, Research Assistant Professors Visser and Petcher, and Research Associate Rivas are currently conducting research in many areas of high energy theoretical and mathematical physics. These areas include: lattice gauge calculations of masses and weak matrix elements; strong-coupling approximation; low-energy effective field theories; classical solutions of non-Abelian gauge theories; mean-field approximation in quantum field theory; path integral and coherent state representations in quantum field theory; the nature of perturbation theory in large order; quark condensation in QCD; chiral fermion theories on the lattice; the 1/N expansion in quantum field theory; effective potential and action in quantum field theories, including QCD; studies of the early universe and inflation; quantum gravity. This work is described in detail in the body of this proposal.

19994 (FNAL/C–92/79) **Latest results on the direct CP violation measurements:** E'/ϵ. Hsiung, Yee B. E731 Collaboration. Fermi National Accelerator Lab., Batavia, IL (United States). Mar 1992. 52p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH03000. (CONF-910836–3: 19. SLAC summer institute on particle physics, Stanford, CA (United States), 5-16 Aug 1991). Order Number DE92011378. Source: OSTI; NTIS; INIS; GPO Dep.

Preliminary results, based on the full data sample from Fermilab-E731 and the combined data sample from CERN-NA31, on the "direct" CP-violation measurements $\epsilon'\epsilon$ in neutral kaon decay have been reviewed. The E731's results if $\mathrm{Re}(\epsilon'\epsilon) = (6.0 \pm 5.8(\mathrm{stat}) \pm 3.2(\mathrm{syst}) \pm 1.8(\mathrm{MC})) \times 10^{-4}$, which provides no evidence for "direct" CP-violation, thus supporting the Superweak model; while the NA31's combined result (1986 + 1988 + 1989 data) is $\mathrm{Re}(\epsilon'/\epsilon = (23 \pm 3.4(\mathrm{stat})\ \pm 6.5(\mathrm{syst})) \times 10^4$, three standard deviations from zero, which provides evidence for the "direct" CP-violation in the Standard Model. Comparisons of the two experiments are made. The Fermilab-E731 group has also fit for the other parameters of the neutral kaon system in their 2π data sample, such as: the K_S life time τ_S; the K_L-K_S mass difference δm; the phase difference between η_{+-}, $\delta\phi = (-0.6 \pm 1.6)^\circ$). Which is a test of CPT invariance; the Superweak phase $\phi_{SW} = (43.37 \pm 0.22)^\circ$, and the phase of $\eta_\pm$, $\phi_\pm = (43.2 \pm 1.6)^\circ$, which is predicted by CPT invariance to equal ϕ_{SW}.

19995 (GSI–91-65(prepr.)) **The geometry of the thermal quasi-particle transformation.** Henning, P.A. (Gesellschaft fuer Schwerionenforschung mbH, Darmstadt (Germany)); Graf, M.; Matthaeus, F. Gesellschaft fuer Schwerionenforschung mbH, Darmstadt (Germany). Dec 1991. 22p. Order Number DE92516489. Source: OSTI; NTIS (US Sales Only); INIS.

We introduce a new concept for thermal quantum theories, which expresses a time dependent quasi-particle picture as the coupling to an external (classical) gauge field. The non-abelian nature of this field even for quasi-free systems can lead to renormalization factors that depend on the system's history. In this framework, the geometry of adiabatic time evolutions is investigated in detail, and implications for non-equilibrium systems are discussed. (orig.).

19996 (INIS-mf–13192, pp. 65-66) **Dynamics of solitons in the presence of dissipation and external forces.** Majernikova, E. (Slovenska Akademia Vied, Bratislava (Czechoslovakia). Fyzikalny Ustav). Jednota Ceskoslovenskych Matematiku a Fyziku, Prague (Czechoslovakia). 1991. 319p. (In Slovak). (CONF-9008243–: 10. conference of Czechoslovak physicists, Brno (Czechoslovakia), 27-31 Aug 1990). In *The tenth conference of Czechoslovak physicists*. Order Number DE92628439. Source: OSTI; NTIS (US Sales Only); INIS.

Solitons and solitary waves have been adopted as an approach to elementary excitations in low-dimensional complex systems with interactions. Many nonlinear equations of the quantum and classical field theories find application in models of solids. Some methods are given of the investigation of solitons using two "ϕ^4" nonlinear equations (equations with a bi-stable potential and the Sine-Gordon equation with a multi-stable potential) and of their modifications in relation to the effect of dissipation and of external forces. (Z.S.). 6 refs.

19997 (INIS-mf–13192, pp. 247) **Lattice investigation of strong Yukawa coupling.** Jersak, J. Jednota Ceskoslovenskych Matematiku a Fyziku, Prague (Czechoslovakia). 1991. 319p. 19999 (INIS-mf--13194, pp. 31-42) **Fermionic and gauge fields in interaction - a question of anomalies.** Cronstroem, C. (Helsinki Univ. (Finland). Dept. of Theoretical Physics). Slovenska Akademia Vied, Bratislava (Czechoslovakia). Fyzikalny Ustav; Komenskeho Univ., Bratislava (Czechoslovakia). Matematicko-Fyzikalna Fakulta; Jednota Slovenskych Matematikov a Fyzikov, Bratislava (Czechoslovakia). 1989. 395p. (CONF-8909475--: Hadron Structure '89, Smolenice (Czechoslovakia), 25-28 Sep 1989). In *Hadron structure '89: Proceedings of the conference.* Order Number DE92628522. Source: OSTI; NTIS (US Sales Only); INIS.

Anomalies in non-Abelian gauge theories are briefly discussed. Specifically, an account is given of the work of L.D. Fadeev (Phys. Lett. 145 B, 81 (1984)) and his co-workers on anomalies in the commutator algebra of the Gauss' law constraints for the theory of Yang-Mills fields interacting with chiral (left-handed) fermion fields. The considerations lead to the conclusion that the Hamiltonian operator formalism is at the present stage of development unable to provide a framework in which the anomalies are understood in a satisfactory manner. However, it appears that the anomalies in question can be well understood in the functional integral formalism. (Z.S.) 5 refs.

20000 (INIS-mf--13194, pp. 43-48) **Extended BRS-method and gauge-independence of anomalies.** Kummer, W. (Technische Univ., Vienna (Austria). 1. Inst. fuer Theoretische Physik). Slovenska Akademia Vied, Bratislava (Czechoslovakia). Fyzikalny Ustav; Komenskeho Univ., Bratislava (Czechoslovakia). Matematicko-Fyzikalna Fakulta; Jednota Slovenskych Matematikov a Fyzikov, Bratislava (Czechoslovakia). 1989. 395p. (CONF-8909475--: Hadron Structure '89, Smolenice (Czechoslovakia), 25-28 Sep 1989). In *Hadron structure '89: Proceedings of the conference.* Order Number DE92628522. Source: OSTI; NTIS (US Sales Only); INIS.

In the 'extended' BRS method the gauge-breaking term in the action receives a further contribution from the BRS variation of the gauge parameters. This is supplemented by symmetry transformations belonging to external auxiliary gauge fields and corresponding ghosts which are coupled to the 'external' anomalies of the theory. As an application of this new comprehensive cohomology relation, the gauge independence is shown of the anomaly related to the Rebhan-Kraemmer current of the bosonic string. (author) 10 refs.

20001 (INIS-mf--13194, pp. 74-96) **Semiclassical limit, confinement and field configurations in lattice QCD.** Campostrini, M. (Istituto Nazionale di Fisica Nucleare, Pisa (Italy)); Di Giacomo, A.; Maggiore, M.; Panagopoulos, H.; Vicari, E.; Olejnik, S. Slovenska Akademia Vied, Bratislava (Czechoslovakia). Fyzikalny Ustav; Komenskeho Univ., Bratislava (Czechoslovakia). Matematicko-Fyzikalna Fakulta; Jednota Slovenskych Matematikov a Fyzikov, Bratislava (Czechoslovakia). 1989. 395p. (CONF-8909475--: Hadron Structure '89, Smolenice (Czechoslovakia), 25-28 Sep 1989). In *Hadron structure '89: Proceedings of the conference.* Order Number DE92628522. Source: OSTI; NTIS (US Sales Only); INIS.

The study of semiclassical configurations, confinement and field configurations in lattice QCD has led to the following conclusions: string tension is produced by semiclassical configurations other than instantons; field configurations which produce confinement are chromoelectric flux tubes with a Gaussian transverse shape and a size of the order of half a Fermi; universality is obeyed; the best way to define a topological charge is the standard field theory. Topological charge survives cooling: possible losses of topological charge due to metastability can be monitored using the field theoretical definition. (Z.S.) 1 tab., 14 figs., 21 refs.

20002 (INIS-mf--13194, pp. 254-263) **Intermittent behaviour in the Ising model.** Novak, I. (Slovenska Akademia Vied, Bratislava (Czechoslovakia). Fyzikalny Ustav). Slovenska Akademia Vied, Bratislava (Czechoslovakia). Fyzikalny Ustav; Komenskeho Univ., Bratislava (Czechoslovakia). Matematicko-Fyzikalna Fakulta; Jednota Slovenskych Matematikov a Fyzikov, Bratislava (Czechoslovakia). 1989. 395p. (CONF-8909475--: Hadron Structure '89, Smolenice (Czechoslovakia), 25-28 Sep 1989). In *Hadron structure '89: Proceedings of the conference.* Order Number DE92628522. Source: OSTI; NTIS (US Sales Only); INIS.

A clear evidence of intermittency in the two-dimensional Ising model at the critical point is found. It is shown how to get rid of the statistical fluctuations due to the finite size of phase space windows, which allows to obtain intermittency starting from rather small lattices. The estimate of the fractal dimension of a set of sites with spin up found from calculations on the lattice of 64x64 is discussed as are the implications for a search of intermittency in multiparticle production. (author) 2 tabs., 2 figs., 8 refs.

20003 (INIS-mf--13194, pp. 271-276) **Elastic scattering and the problem of transparent nucleon.** Kundrat, V. (Ceskoslovenska Akademie Ved, Prague (Czechoslovakia). Fyzikalni Ustav); Lokajicek, M.; Krupa, D. Slovenska Akademia Vied, Bratislava (Czechoslovakia). Fyzikalny Ustav; Komenskeho Univ., Bratislava (Czechoslovakia). Matematicko-Fyzikalna Fakulta; Jednota Slovenskych Matematikov a Fyzikov, Bratislava (Czechoslovakia). 1989. 395p. (CONF-8909475--: Hadron Structure '89, Smolenice (Czechoslovakia), 25-28 Sep 1989). In *Hadron structure '89: Proceedings of the conference.* Order Number DE92628522. Source: OSTI; NTIS (US Sales Only); INIS.

Two regions of momentum transfer in the differential cross section data on high-energy elastic hadron scattering are of great physical interest: the region of the diffraction minimum where the diffractive structure appears, and nearly forward scattering where the collisions mostly take place due to Coulomb scattering. Since there is no reliable theory for high energy diffractive scattering there are attempts to describe and eventually to correlate the differential cross sections at these two regions in a phenomenological way. Various recently published approaches are discussed including those based on the geometrical scaling equations, the West and Yennie form of the total scattering amplitude, etc. (Z.S.) 12 refs.

20004 (INIS-mf--13194, pp. 361-365) **Constraints, BRST-cohomology and stochastic quantization.** Hueffel, H. (Vienna Univ. (Austria). Inst. fuer Theoretische Physik). Slovenska Akademia Vied, Bratislava (Czechoslovakia). Fyzikalny Ustav; Komenskeho Univ., Bratislava (Czechoslovakia). Matematicko-Fyzikalna Fakulta; Jednota Slovenskych Matematikov a Fyzikov, Bratislava (Czechoslovakia). 1989. 395p. (CONF-8909475--: Hadron Structure '89, Smolenice (Czechoslovakia), 25-28 Sep 1989). In *Hadron structure '89: Proceedings of the conference.* Order Number DE92628522. Source: OSTI; NTIS (US Sales Only); INIS.

A brief exposition of the BRST formalism is followed by an introduction of stochastic quantization in the extended configuration space. The appearance of a specific projection operator and its relation to BRST cohomology is pointed out. (author) 20 refs.

20005 (INIS-mf--13194, pp. 303-307) **Four-point meson-Green-functions in the strong coupling limit of lattice QCD.** Gasser, I. (Technische Univ., Vienna (Austria). Inst. fuer Experimentelle Kernphysik); Faber, M.; Feilmair, W.; Kainz, W.; Markum, H. Slovenska Akademia Vied, Bratislava (Czechoslovakia). Fyzikalny Ustav; Komenskeho Univ., Bratislava (Czechoslovakia). Matematicko-Fyzikalna Fakulta; Jednota Slovenskych Matematikov a Fyzikov, Bratislava (Czechoslovakia). 1989. 395p. (CONF-8909475--: Hadron Structure '89, Smolenice (Czechoslovakia), 25-28 Sep 1989). In *Hadron structure '89: Proceedings of the conference*. Order Number DE92628522. Source: OSTI; NTIS (US Sales Only); INIS.

The scattering matrix for elastic meson-meson scattering was determined in the strong coupling limit of lattice QCD. It was found that the strong coupling limit is able to describe resonance states. The scattering matrix has a pole which can be attributed to the propagation of a long-lived particle. (author) 2 figs., 4 refs.

20006 (INIS-mf–13194, pp. 387-391) **Scalar glueball and coupled channels.** Krupa, D. (Slovenska Akademia Vied, Bratislava (Czechoslovakia). Fyzikalny Ustav); Surovtsev, Y.S. Slovenska Akademia Vied, Bratislava (Czechoslovakia). Fyzikalny Ustav; Komenskeho Univ., Bratislava (Czechoslovakia). Matematicko-Fyzikalna Fakulta; Jednota Slovenskych Matematikov a Fyzikov, Bratislava (Czechoslovakia). 1989. 395p. (CONF-8909475–: Hadron Structure '89, Smolenice (Czechoslovakia), 25-28 Sep 1989). In *Hadron structure '89: Proceedings of the conference*. Order Number DE92628522. Source: OSTI; NTIS (US Sales Only); INIS.

A new method is proposed for analyzing the scalar meson scattering amplitude by means of its uniforming. This gives a compact formula for the analysis of the isoscalar s-wave pion-pion scattering in terms of the multipole resonance description. In order to extend the scattering matrix from the physical region to all unphysical sheets in the energy variable, the unitarity relation was used. It is shown that a simple description of the partial wave scattering amplitude can be achieved even in the presence of resonant states and other strongly coupled scattering channels. (Z.S.) 8 refs.

20007 (INS–912) **On the problem of soliton-impurity interaction.** Kudryavtsev, A.E. Tokyo Univ., Tanashi (Japan). Inst. for Nuclear Study. Jan 1992. 17p. Order Number DE92514985. Source: OSTI; NTIS (US Sales Only); INIS.

The scattering of soliton on impurity of δ-type for the classical $\lambda\psi_2{}^4$-theory is considered. In the case of small coupling with impurity the potential approach is shown to be valid. The energy losses of soliton, moving in the potential, are calculated. The problem of the so-called resonance-impurity interaction is also considered. (author).

20008 (ITF–89-43) **Supersymmetry in the problem of electron motion on a surface orthogonal to force lines of external magnetic field.** Sitenko, Yu.A. AN Ukrainskoj SSR, Kiev (Ukraine). Inst. Teoreticheskoj Fiziki. 1989. 24p. (In Russian). Order Number DE92627217. Source: OSTI; NTIS (US Sales Only); INIS.

A supersymmetric quantum mechanics realized in the problem of two-dimensional electron motion in an external static magnetic field of arbitrary configuration is discussed. Zero modes of the supersymmetric Hamiltonian an compact and single-and double-connected surfaces are considered. The degeneracy of the supersymmetric ground state is found and the conditions of the spontaneous supersymmetry breaking are obtained. 21 refs.

20009 (ITF–89-45) **Non-standard representations of the physical groups and Heisenberg algebras and non-unitary quantization.** Sannikov, S.S. AN Ukrainskoj SSR, Kiev (Ukraine). Inst. Teoreticheskoj Fiziki. 1989. 35p. (In Russian). Order Number DE92627218. Source: OSTI; NTIS (US Sales Only); INIS.

A mathematical apparatus of the non-unitary quantization method is developed. The non-standard (non-Fock) representations of the Heisenberg algebras and non-standard representations of their automorphism groups underlies this theory. Extended Fock representations of the Heisenberg algebras are built. 17 refs.

20010 (ITP–89-42) **Multiloop calculations in p-adic string theory and Bruhat-Tits trees.2.** Zabrodin, A.V.; Mironov, A.D.; Chekhov, L.O. AN Ukrainskoj SSR, Kiev (Ukraine). Inst. Teoreticheskoj Fiziki. 1989. 36p. Order Number DE92627219. Source: OSTI; NTIS (US Sales Only); INIS.

The open p-adic string world sheet as a coset space $F=T/\Gamma$, where T is the Bruhat-Tits tree for the p-adic linear group $GL(2.Q_p)$ is some Schottky group is treated. The boundary of this world sheet corresponds to p-adic Mumford curve of finite genus. The string dynamics is governed by the local Gaussian action on the coset space F. The tachyon amplitudes expressed in terms of p-adic Θ-functions are proposed for the Mumford curve of arbitrary genus and compared with the corresponding usual archimedian amplitudes. 41 refs.; 14 figs.

20011 (ITP–89-57) **Semiclassical approach to ground states within Klein-Gordon equation.** Kobylinskij, N.A.; Stepanov, S.S.; Tutik, R.S. AN Ukrainskoj SSR, Kiev (Ukraine). Inst. Teoreticheskoj Fiziki. 1989. 9p. Order Number DE92627259. Source: OSTI; NTIS (US Sales Only); INIS.

A new method for deriving Regge-trajectories and energy eigenvalues for ground states of central potentials is applied to the Klein-Gordon equation. Based upon the $\hbar$-expansion, the simple recursion formulas are presented. The problems of the π-mesonic atom and funnel-shaped potential are treated with this technique. 12 refs.; 1 tab.

20012 (ITP–89-58) **$\hbar$-expansion for Regge-trajectories: 1. The Schroedinger equation.** Kobylinskij, N.A.; Stepanov, S.S.; Tutik, R.S. AN Ukrainskoj SSR, Kiev (Ukraine). Inst. Teoreticheskoj Fiziki. 1989. 23p. Order Number DE92627215. Source: OSTI; NTIS (US Sales Only); INIS.

The $\hbar$-expansion provides a powerfull new, complimentary to the WKB method, tool for deriving Regge-trajectories and energy eigenvalues for bound states of central potentials in the Schroedinger equation framework. Based upon the logarithmic perturbation theory in Planck's constant, the simple recursion formulas which facilitate the calculation are presented. Numerical calculations for specific potentials widely used in the quarkonium physics illustrate the speed and accuracy of the technique. 23 refs.; 6 tabs.

20013 (ITP–89-82) **The partition function of 2d-Ising model with the magnetic fields on bounderies and $C=1/2$ virasoro characters.** Bugrij, A.I.; Shadura, V.N. AN Ukrainskoj SSR, Kiev (Ukraine). Inst. Teoreticheskoj Fiziki. 1989. 13p. Order Number DE92627220. Source: OSTI; NTIS (US Sales Only); INIS.

The partition function of a planar Ising model on a finite lattice with magnetic fields on the boundaries is represented through the anticommuting functional integral with Gaussian distribution. In particular, the previously unknown solution for the case of fields of opposite direction is obtained. It is shown also that the partition function of the model at the critical point in the continuous limit can be expressed through certain characters of highest-weight irreducible representations of Virasoro algebra. 15 refs.

20014 (ITP–90-5) **Asymptotic representations of the running parameters in Yang-Mills theories.** Maksimov, S.I.; Vovk, V.I. AN Ukrainskoj SSR, Kiev (Ukraine). Inst. Teoreticheskoj Fiziki. 1990. 12p. Order Number DE92627223. Source: OSTI; NTIS (US Sales Only); INIS.

It is shown that a unique perturbative solution to the renormalization group (RG) equation for the running coupling constant (RCC) exists. The general representations of the running coupling constant and mass in the form of asymptotic expansions are explicity derived. A two-parameter ambiguity in these expansions which leaves invariant the full result is discovered. This feature is observed to be an attribute of the particular type of transcedental equations resulting from the differential RG equation for the RCC. 16 refs.

20015 (ITP–90-16) **Vanishing of vacuum energies in gauged extended supergravity compactified on torus.** Bytsenko, A.A. AN Ukrainskoj SSR, Kiev (Ukraine). Inst. Teoreticheskoj Fiziki. 1990. 13p. Order Number DE92627221. Source: OSTI; NTIS (US Sales Only); INIS.

A mechanism of the cosmological constant vanishing in gauged $N=4$ supergravity on the background $M_p=T^p x R^{4-p}$ at finite temperature is analyzed. Here T^p, R^{4-p} are the p-dimensional torus and the flat space respectively, $p=1,...,4$.It is shown that this mechanism results from the one-loop Casimir effect. 16 refs.

20016 (ITP–90-46) **New method of massive Feynman diagrams calculation. Vertex-type functions.** Kotikov, A.V. AN Ukrainskoj SSR, Kiev (Ukraine). Inst. Teoreticheskoj Fiziki. 1990. 20p. Order Number DE92627222. Source: OSTI; NTIS (US Sales Only); INIS.

Vertex functions are calculated in the framework of differential equation method. As an example of calculation of one- and two-loop diagrams, it is shown that by analogy with propagator-type diagrams this method provides a simple procedure of evaluating the result without D- space integrals (for the dimensional regularization) calculation. 13 refs.

20018 (OUP–92-01) **Dynamics of magnetic fields in Maxwell, Yang-Mills and Chern-Simons theories on the torus.** Burgess, M. (Oslo Univ., Fysisk Inst. (Norway)); McLachlan, A.; Toms, D.J. Oslo Univ. (Norway). Fysisk Inst. Jan 1992. 92p. Order Number DE92628449. Source: OSTI; NTIS (US Sales Only); INIS.

The problem of uniform magnetic fields passing perpendicularly through a 2-torus, Abelian and Non-Abelian, is considered. Focus is on dynamical effects of non-integrable phases on the torus at non zero B and from magnetic fields themselves in the vacuum. The spectrum is computed and is shown to be always independent of the non-integrable phases on the torus. It is concluded that a Chern-Simons term will always be induced by radiative corrections to fermions on the torus when $B \neq 0$. The special case of an electromagnetically uncharged anyon gas in noted and shown to be a system whose spectrum can depend on the non-integrable phases in the two torus directions, subject to a consistency requirement. In three and four dimensions, dynamical symmetry breaking of non-Abelian fields and associated condensate formation is possible by radiative corrections. The classification on non-Abelian magnetic fields in terms of "flux integers" is discussed, and a method for obtaining such integers for an arbitrary gauge algebra is presented. This provides a rigorous generalisation of Hooft's su (2) classification. 72 refs., 5 figs.

20019 (UWThPh–1991-54) **The geometric phase and the Schwinger term in some models.** Grosse, H. (Vienna Univ. (Austria). Inst. fuer Theoretische Physik); Langmann, E. Vienna Univ. (Austria). Inst. fuer Theoretische Physik. 18 Dec 1991. 33p. Order Number DE92627224. Source: OSTI; NTIS (US Sales Only); INIS.

We discuss quantization of fermions interacting with external fields and observe the occurrence of equivalent as well as inequivalent representations of the canonical anticommutation relations. Implementability of gauge and axial gauge transformations leads to generators which fulfill an algebra of charges with Schwinger term. This term can be written as a cocycle and leads to the boson-fermion correspondence. Transport of a quantum mechanical system along a closed loop of parameter space may yield a geometric mechanical system along a closed loop of parameter space may yield a geometric phase. We discuss models for which nonintegrable phase factors are obtained from the adiabatic parallel transport. After second quantization one obtains, in addition, a Schwinger term. Depending on the type of transformation a subtle relationship between these two obstructions can occur. We indicate finally how we may transport density matrices along closed loops in parameter space. (authors).

Until relatively recently, a taxonomist of science would divide most areas of physics into two types: theoretical and experimental. With the advent of large scale computing, however, there is now another recognized field: computational physics. For there is now another recognized field: computational physics. For High Energy Physics one of the most prominent manifestations of this phenomenon is the emergence of the discipline known as lattice Quantum Chromodynamics, or lattice QCD. Problems which a decade ago seemed intractable are not succumbing to large scale numerical simulations. These simulations are consuming vast amounts of computer time these days, and promise to do so for at least the next decade. To take but one example, in each of the last three years, the Department of Energy has allocated several thousand Cray-2 hours at NERSC for the computation of certain weak interaction matrix elements. In the following pages the author will give a brief overview of this and some other projects.

20021 (DESY–91-151) **Thermal equilibrium during the electroweak phase transition.** Tetradis, N. Deutsches Elektronen-Synchrotron (DESY), Hamburg (Germany). Dec 1991. 20p. Order Number DE92516965. Source: OSTI; NTIS (US Sales Only); INIS.

The effective potential for the standard model develops a barrier, at temperatures around the electroweak scale, which separates the minimum at zero field and a deeper non-zero minimum. This could create out of equilibrium conditions by inducing the localization of the Higgs field in a metastable state around zero. In this picture vacuum decay would occur through bubble nucleation. I show that there is an upper bound on the Higgs mass for the above scenario to be realized. The barrier must be high enough to prevent thermal fluctuations of the Higgs expectation value from establishing thermal equilibrium between the two minima. The upper bound is estimated to be lower than the experimental lower limit. This is also imposes constraints on extensions of the standard model constructed in order to generate a strongly first order phase transition. (orig.).

20022 (DOE/ER/40652–1) **[Pion interferometry search for a phase change in hadronic matter in relativistic heavy ion collisions and its application to RHIC: Progress report].** Cherney, M. Creighton Univ., Omaha, NE (United States). [1992]. 12p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG02-91ER40652. Order Number DE92011436. Source: OSTI; NTIS; INIS; GPO Dep.

The purpose of this research is to assist in the investigation of the behavior of hadronic matter under extreme conditions. Specifically, this project intends to actively involve Creighton students and faculty in the search for indications of a phase transition from hadronic to quark matter. It is believed that the conditions necessary for the formation of this quark-gluon plasma include large energy densities over extended volumes. The technique of boson interferometry may prove to be the effective tool in verifying the existence of a quark-gluon plasma. This project continues active collaboration with Department of Energy research centers working on the NA36, NA44, and STAR experiments. It involves the effective development of the hardware, software and analytical skills required for a large relativistic heavy ion facility at Brookhaven National Laboratory (RHIC). Integral to this endeavor are educational opportunities for students at Creighton University.

20023 (FNAL/C–91/335-A) **Constraints on fermion mixing with exotics.** Nardi, E. (Michigan Univ., Ann Arbor, MI (United States). Randall Lab. of Physics); Roulet, E.; Tommasini, D. Fermi National Accelerator Lab., Batavia, IL (United States). Nov 1991. 7p. Sponsored by USDOE, Washington, DC (United States); National Aeronautics and Space Administration, Washington, DC (United States). DOE Contract AC02-76CH03000. Grant NAGW 1340. (FTUV–91-52;UM-TH–91-31;CONF-9110332–2: International workshop on electroweak physics beyond the standard model, Valencia (Spain), 2-5 Oct 1991). Order Number DE92011701. Source: OSTI; NTIS; INIS; GPO Dep.

We analyze the constraints on the mixing angles of the standard fermions with new heavy particles with exotic SU(2) x U(1) quantum number assignments (left-handed singlets or right-handed doublets), that appear in many extensions of the electroweak theory. The updated Charged Current and Neutral Current experimental data, including also the recent Z-peak measurements, are considered. The results of the global analysis of all these data are then presented.

20024 (FNAL/C–91/349-A) **The physics of strange matter.** Olinto, A.V. (Chicago Univ., IL (United States). Dept. of Astronomy and Astrophysics). Fermi National Accelerator Lab., Batavia, IL (United States). Dec 1991. 27p. Sponsored by USDOE, Washington, DC (United States); National Aeronautics and Space Administration, Washington, DC (United States); National Science Foundation, Washington, DC (United States). DOE Contract AC02-76CH03000 ;FG02-91ER40606. Grant AST-22595;Grant NAGW-2381. (CONF-9108186–3: Relativistic aspects of nuclear physics, Rio de Janeiro (Brazil), 2-30 Aug 1991). Order Number DE92011734. Source: OSTI; NTIS; INIS; GPO Dep.

Strange matter may be the ground state of matter. We review the phenomenology and astrophysical implications of strange matter, and discuss the possible ways for testing the strange matter hypothesis.

20025 (FNAL/C–92/20-A) **Quark matter and cosmology.** Schramm, D.N. (Chicago Univ., IL (United States)); Fields, B.; Thomas, D. Fermi National Accelerator Lab., Batavia, IL (United States). Jan 1992. 16p. Sponsored by USDOE, Washington, DC (United States); National Aeronautics and Space Administration, Washington, DC (United States); National Science Foundation, Washington, DC (United States). DOE Contract AC02-76CH03000 ;FG02-91ER40606. Grant AST 90-22629;Grant NAGW-1381;Grant NAGW-1321. (CONF-9111165–12: Quark matter '91, Gatlinburg, TN (United States), 11-15 Nov 1991). Order Number DE92011736. Source: OSTI; NTIS; INIS; GPO Dep.

The possible implications of the quark-hadron transition for cosmology are explored. Possible surviving signatures are discussed. In particular, the possibility of generating a dark matter candidate such as strange nuggets or planetary mass black holes is noted. Much discussion is devoted to the possible role of the transition for cosmological nucleosynthesis. It is emphasized that even an optimized first order phase transition will not significantly alter the nucleosynthesis constraints on the cosmological baryon density nor on neutrino counting. However, it is noted that Be and B observations in old stars may eventually be able to be a signature of a cosmologically significant quark-hadron transition. It is pointed out that the critical point in this regard is whether the observed B/Be ratio can be produced by spallation processes or requires cosmological input. Spallation cannot produce a B/Be ratio below 7.6. A supporting signature would be Be and B ratios to oxygen that greatly exceed galactic values. At present, all data is still consistent with a spallagenic origin.

20026 (HEPHY-PUB–562-91) **Significance of relativistic wave equations for bound states.** Rupprecht, H. (Vienna Univ. (Austria). Inst. fuer Theoretische Physik); Schoeberl, F.F.; Lucha, W. Vienna Univ. (Austria). Inst. fuer Theoretische Physik. Nov 1991. 24p. (UWThPh–1991-56.). Order Number DE92628500. Source: OSTI; NTIS (US Sales Only); INIS.

We scrutinize the relevance of relativistic wave equations for the description of quark-antiquark bound states. By comparing the predictions of the nonrelativistic Schroedinger equations (with the only lowest-order relativistic corrections of the famous Breit - Fermi Hamiltonian), the spinless Salpeter equation, and a new semirelativistic wave equation (which incorporates relativistic kinematics and the complete relativistic corrections to the static interaction potential) for light and heavy quarkonia within three different models, we discuss the extent to which the use of relativistic wave equations is reasonable or necessary in order to reproduce the experimentally observed meson mass spectra. We are forced to conclude that - contrary to one's physical intuition - a relativistic treatment of bound states by a potential provides no improvement at all compared to the corresponding nonrelativistic description. (authors).

20027 (HEPHY-PUB–563-91) **Prospects of SUSY-searches. A theoretical overview.** Bartl, A. (Vienna Univ. (Austria). Inst. fuer Theoretische Physik); Majerotto, W.; Moesslacher, B. Vienna Univ. (Austria). Inst. fuer Theoretische Physik. Oct 1991. 15p. (UWThPh–1991-43.). Order Number DE92627263. Source: OSTI; NTIS (US Sales Only); INIS.

Predictions within the minimal supersymmetric standard model for SUSY particle searches at HERA, LEP200, and LHC/SSC are presented. Possible signatures are discussed. (authors).

20028 (IFVE-OTF–91-39) **Relativistic formulation of quark model.** Zorin, O.L. Gosudarstvennyj Komitet po Ispol'zovaniyu Atomnoj Ehnergii SSSR, Serpukhov (USSR). Inst. Fiziki Vysokikh Ehnergij. 1991. 10p. (IHEP-OTF–91-39.). Order Number DE92627282. Source: OSTI; NTIS (US Sales Only); INIS.

A relativistic model, which describes spin-orbital excitations of quark-antiquark bound system, is proposed. A formulation of the model provides the meson classification established in frame of the nonrelativistic quark model. 3 refs.

Quantum chromodynamics predicts a first order phase transition from confined hadronic matter to unconfined quark-gluon plasma (QGP) at a temperature in the range 100-200 MeV. It is probable that such a temperature can be reached in collisions between two heavy ions moving at relativistic energies. Such experiments have been performed in CERN and BNL in the last two years, although so far it has been possible to use only light nuclei as projectiles. The main problem thrown up by these experiments is the determination of the signal for the formation of the QGP. The suggestions made so far and their status are discussed. In the standard big-bang (SSB) model of the universe, for explaining the primordial nucleosynthesis it is assumed that the universe started with a uniform distribution of hadrons and leptons. When the temperature of the universe fell below 2 MeV the nucleons fused together to form the light nuclei ^{2}H, ^{4}He and ^{7}Li. Recently it has been pointed out that when the temperature of the universe was about 100 MeV it would have undergone the same phase transition mentioned above, albeit from the QGP to the hadronic phase. As a result there would have been an inhomogeneous distribution of nucleons and not a homogeneous one as assumed in SSB. Because of the inhomogeneity the primordial nucleosynthesis processes would have been altered. The consequences and implications of this changed picture of the nucleosynthesis in the early universe are discussed. (author). 25 refs., 3 figs.

In the contemporary picture the consituents of the nucleus, neutrons and protons, are composed of quarks and gluons. Their dynamics is described by the QCD, in which the chiral symmetry is a basic ingredient. Around the centre of the nucleons this symmetry is very much obeyed, which near the surface is violated, giving rise to the non-conservation of the axial vector current. It is believed that on the surface of the nucleons this symmetry is restored by the birth of pions. Thus, looking from the inside of the nucleons the pions provide an additional axial vector current to restore the chiral symmetry and for the nuclear physics they provide the basic starting point for its dynamics. The nucleons themselves, in this picture, are surrounded by a cloud of pions and their resonances. Physically this picture leads to the differences in the measured radii of the nucleons using different probes and a simple description of the charge-exchange spin-isospin flip reactions. It also puts the propagation of pions and rho-mesons (a resonant state of two pions probably) in nuclear medium in a category of basic importance. The first excited state of the nucleon, the Δ-isobar, to which the pions couple very strongly, acquires, in a natural way, a very significant place in the nuclear dynamics. (author). 10 refs., 4 figs.

20032 (INIS-mf–13192, pp. 125-126) **Physics of the standard model of electroweak interactions.** Horejsi, J. (Karlova Univ., Prague (Czechoslovakia). Fakulta Matematicko-Fyzikalni). Jednota Ceskoslovenskych Matematiku a Fyziku, Prague (Czechoslovakia). 1991. 319p. (In Czech). (CONF-9008243–: 10. conference of Czechoslovak physicists, Brno (Czechoslovakia), 27-31 Aug 1990). In *The tenth conference of Czechoslovak physicists.* Order Number DE92628439. Source: OSTI; NTIS (US Sales Only); INIS.

The Glashow-Salam-Weinberg (GSW) standard model (SM) of electroweak interactions is a theory unifying weak and electromagnetic interactions based on principles of non-Abelian calibration invariance and the Higgs mechanism. The SM agrees well with all existing experimental data, and experiments performed so far confirmed the predicted properties of interactions of intermediate vector bosons (IVBs) with fermions (leptons and quarks). The disclosure of the existence and structure of neutral, fermion currents was an experimental landmark thanks to which the GSW theory was actually recognised as a realistic (i.e., standard) model of electroweak interactions even before IVBs were discovered. The GSW theory also predicts another particle which has not yet been observed, the Higgs' boson. Among the most remarkable, already confirmed predictions of the SM are formulas for the masses of IVBs following from the presumed specific (minimum) variant of the Higgs mechanism. (Z.S.). 5 refs.

Investigation of lepton-hadron collisions at the Hadron-Elektron-Ring-Anlage (HERA) in DESY Hamburg is aimed at the elucidation of the internal structure of nucleons. Due to the high centre-of-gravity energy, the cross sections for the formation of heavy c and b quarks are sufficiently large to enable the mechanism of formation of the corresponding heavy mesons to be studied. During scattering to high angles ($Q^2 >\approx 10\ 000$ GeV^2), weak processes become stronger than electromagnetic processes. This allows the prediction of the Salam-Weinberg model to be tested in a new kinematic region. A basic task of experiments studying the scattering of leptons on hadrons consists in the measurement of inelastic scattering. The differential cross section, which depends not only on the collision energy but also on two additional kinematic variables, can be used to determine the structure functions of nucleons. In the HERA energy region the cross sections for the formation of particles with the open quantum number grace and beauty ("heavy flavors") are sufficiently large and the background is fairly low compared with the case of colliding hadron beams. The dominant process in the formation of particles with heavy flavors Q = c,b is the boson-gluon fusion mechanism. The total cross sections for the inclusive formation of a c (b) quark in the lowest order of the perturbation theory are 10^6 (85.10^3) pbarn. (Z.S.). 3 refs.

20034 (INIS-mf–13192, pp. 103-108) **Non-classical properties of new quantum states of light.** Kral, P. (Ceskoslovenska Akademie Ved, Prague (Czechoslovakia). Fyzikalni Ustav). Jednota Ceskoslovenskych Matematiku a Fyziku, Prague (Czechoslovakia). 1991. 319p. (In Czech). (CONF-9008243–: 10. conference of Czechoslovak physicists, Brno (Czechoslovakia), 27-31 Aug 1990). Source: OSTI; NTIS (US Sales Only); INIS.

The ambiguities in the off-shell behavior of spin-1 exchange can be resolved to $O(p^4)$ in the chiral low-energy expansion if the asymptotic behavior of QCD is properly incorporated. As a consequence, the chiral version of vector (and axial vector) meson dominance is model independent. Additional high-energy constraints motivated by QCD determine the V,A resonance couplings uniquely. In particular, QCD in its effective chiral implementation successfully predicts $\Gamma(\rho\rightarrow2\pi)$. (author) 10 refs.

Experimental verification of the non-Abelian nature of QCD is a challenge. A new approach is presented which is based upon a good knowledge of the kinematic configuration of flavor-identified quarks and gluons emerging at large polar angles from proton-proton collisions at the ISR. It is also shown that inclusive cross sections for high transverse momentum mesons and details of the event topology are simultaneously reproduced quantitatively in the framework of higher order QCD. All relevant data were taken with the Split Field Magnet detector at the CERN ISR. (author) 1 tab., 12 figs., 17 refs.

Certain directions of hadron electrodynamics referring to testing symmetry properties relatively to C-, P- and T-transformations; determination of fundamental electromagnetic characteristics of hadrons as well as to clarifying the dynamics of electromagnetic processes in which hadrons participate are analyzed briefly. 52 refs.

20043 (ITF–90-16) **Effective action for order parameters and the problem of phase transitions in lattice QCD thermodynamics.** Borisenko, O.A. AN Ukrainskoj SSR, Kiev (Ukraine). Inst. Teoreticheskoj Fiziki. 1990. 44p. (In Russian). Order Number DE92627275. Source: OSTI; NTIS (US Sales Only); INIS.

The phase structure of lattice SU(N)-chromodynamics is discussed. An effective action for Polyakov lines of quark and baryon condensates is constructed for the Euclidean formulation of theory with naive fermions at finite temperatures and baryon number densities. The behaviour of respective averages and the interrelation between them are studied. 25 refs.

20044 (ITP–89-45) **Vacuum polarization and dynamical chiral symmetry breaking in quantum electrodynamics.** Gusynin, V.P. AN Ukrainskoj SSR, Kiev (Ukraine). Inst. Teoreticheskoj Fiziki. 1989. 15p. Order Number DE92627269. Source: OSTI; NTIS (US Sales Only); INIS.

The Schwinger-Dyson equation in the ladder approximation is considered for the fermion mass function taking into account the vacuum polarization effects. It is shown that even in the 'zero-charge' situation there exists, at rather large coupling constant ($\alpha>\alpha_c>0$), a solution with spontaneously broken chiral symmetry. The existence of the local limit in the model concerned is discussed. 30 refs.; 1 fig.

20045 (ITP–89-55) **Analysis of colour screening in a QCD plasma within analytically solvable model.** Borisenko, O.A.; Petrov, V.K.; Zinov'ev, G.M. AN Ukrainskoj SSR, Kiev (Ukraine). Inst. Teoreticheskoj Fiziki. 1989. 11p. Order Number DE92627276. Source: OSTI; NTIS (US Sales Only); INIS.

The connected correlation functions of the Polyakov's loops are analytically analyzed within the approximation of the spherical model for an effective action of lattice QCD at finite temperature. The Coulomb-like behaviour of an imaginary part correlator is found, supporting the idea of a phase transition generated by spontaneous breaking of CP-symmetry. 18 refs.

20046 (ITP–89-72) **Dilepton spectrum from quark-gluon plasma in second Born approximation.** Makhlin, A.N. AN Ukrainskoj SSR, Kiev (Ukraine). Inst. Teoreticheskoj Fiziki. 1989. 29p. Order Number DE92627277. Source: OSTI; NTIS (US Sales Only); INIS.

The real time temperature Keldysh technique has been used to calculate the rate of dilepton emission from quark-gluon plasma in the first order with respect to strong coupling constant. This approximation us shown to be inconsistent. The radiative corrections turned to be of the same order as the contribution of real processes with gluons. Nevertheless the general properties inherent in dilepton emission from continuous media can be verified by measuring the lepton distribution inside the dilepton. 11 refs.; 2 figs.

20047 (ITP–89-73) **Renormalization scheme invariant predictions for deep-inelastic scattering and determination of Λ_{QCD}.** Vovk, V.I. AN Ukrainskoj SSR, Kiev (Ukraine). Inst. Teoreticheskoj Fiziki. 1989. 16p. Order Number DE92627278. Source: OSTI; NTIS (US Sales Only); INIS.

Theoretical aspects of the renormalization scheme (RS) ambiguity problem and the approaches to its solution are discussed from the point of view of QCD phenomenology and the scale Λ determination. The method of RS-invariant perturbation theory (RSIPT) as a sound basis for describing experiment in QCD is advocated. To this end the method is developed for the non-singlet structure functions (SF) of deep-inelastic scattering and recent high precision data on SF's are analyzed in a RS-invariant way. It is shown that RSIPT leads to a more accurate and reliable determination of the QCD scale Λ, which is consistent with the theoretical assumption of a better convergence of RS-invariant perturbative series. 24 refs.; 1 tab.

20048 (ITP–89-81) **Mixed fermion-photon condensate in strongly coupled quantum electrodynamics.** Gusynin, V.P.; Kushnir, V.A. AN Ukrainskoj SSR, Kiev (Ukraine). Inst. Teoreticheskoj Fiziki. 1989. 12p. Order Number DE92627270. Source: OSTI; NTIS (US Sales Only); INIS.

The existence of a new mixed fermion-photon condensate breaking chiral symmetry in strongly coupled phase of quantum electrodynamics is shown. An analytical expression for the renormalized condensate is obtained. 20 refs.; 2 figs.

20049 (ITP–89-83) **Constraints on parameters of gauge theories of interaction from comparison of theoretical and experimental values for anomalous magnetic moments of charged leptons.** Studenikin, A.I. AN Ukrainskoj SSR, Kiev (Ukraine). Inst. Teoreticheskoj Fiziki. 1989. 19p. Order Number DE92627264. Source: OSTI; NTIS (US Sales Only); INIS.

A short of the theoretical and experimental approach to the problem of the anomalous magnetic moment of a charged lepton is presented. The comparison of the precise theoretical and experimental values of the anomalous magnetic moments of the electron and muon provides an ideal tool for testing the validity of theoretical framework. The rigorous bounds on some parameters of different models of interaction are obtained and discussed. 49 refs.

20050 (ITP–90-21) **Supplementing analysis of deconfined phase in lattice QCD thermodynamics.** Bohacik, J.; Borisenko, O.A.; Petrov, V.K.; Zinovjev, G.M. AN Ukrainskoj SSR, Kiev (Ukraine). Inst. Teoreticheskoj Fiziki. 1990. 12p. Order Number DE92627279. Source: OSTI; NTIS (US Sales Only); INIS.

Using strong coupling expansion an expectation value of matter field colour density is calculated in the Hamiltonian formulation of lattice QCD at finite temperature with the staggered fermions. The relation of this value to the imaginary part of fundamental representation character changing the sign under the colour charge conjugation is found out. It is also shown that this expectation value could be used as an order parameter of the phase transition associated with the breaking of the colour charge conjugation symmetry. 12 refs.

20051 (ITP–90-84) **Nonperturbative quantum electrodynamics at $T\neq0$.** Pevzner, M.Sh. AN Ukrainskoj SSR, Kiev (Ukraine). Inst. Teoreticheskoj Fiziki. 1990. 21p. Order Number DE92627271. Source: OSTI; NTIS (US Sales Only); INIS.

On the base of Schwinger-Dyson equation for the electron temperature Green's function in the nonperturbative QED in the ladder approximation the ordinary differential equation for the function, connected with temperature one has been obtained. The relation, to which the temperature depending electron mass m(T) satisfies, has been found; its low-temperature behaviour has been studied. The phase transition has been shown to take place in the model, that is accompanied by the chiral symmetry restoration. 34 refs.

20052 (ITP–91-11) **Multiple rescatterings and spin structure of a baryon-baryon scattering amplitude.** Martynov, E.S. AN Ukrainskoj SSR, Kiev (Ukraine). Inst. Teoreticheskoj Fiziki. 1991. 8p. Order Number DE92627283. Source: OSTI; NTIS (US Sales Only); INIS.

An elastic baryon-baryon interaction with multiple rescatterings taken into account is considered. The simple algebraic expressions that relate six independent amplitudes for such a process with input spin amplitudes are obtained within the impact parameter representation. 5 refs.

20053 (LBL–31483) **Review of CERN heavy-ion physics.** Odyniec, G. Lawrence Berkeley Lab., CA (United States). Nov 1991. 28p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC03-76SF00098. (CONF-9108186–2: Relativistic aspects of nuclear physics, Rio de Janeiro (Brazil), 2-30 Aug 1991). Order Number DE92010259. Source: OSTI; NTIS; INIS; GPO Dep.

Results from the heavy-ion experiments at the CERN SPS are reviewed in the context of possible formation and identification of a quark-gluon plasma (QGP).

20054 (RAL–92-005) **Minimal supersymmetric unification predictions.** Ross, G.G. (Oxford Univ. (United Kingdom). Dept. of Theoretical Physics); Roberts, R.G. Rutherford Appleton Lab., Chilton (United Kingdom). Jan 1992. 28p. Order Number DE92628485. Source: OSTI; NTIS (US Sales Only); INIS.

We re-examine the predictions for the gauge couplings in the minimal extension of the standard model which result from the assumption that the model comes from a unified theory with a single scale of breaking. The effects of thresholds are considered both at the unification scale and at the low-energy scale of the new supersymmetric states. The latter are found to be particularly important and are analysed using the supergravity spectrum corresponding to common scalar and gaugino masses plus other soft supersymmetry breaking terms corrected by gauge and Yukawa radiative corrections. The analysis is extended to include the prediction for the W boson mass coming from the radiatively induced spontaneous symmetry breaking of the standard model. The requirement that this be within the measured value without fine tuning strongly limits the magnitude of the supersymmetry breaking scale and the resulting predictions for the detailed mass spectrum of the supersymmetric states and the Higgs bosons. The bottom quark mass is also determined using the full two-loop renormalisation group equation with the unification prediction $m_b = m_t$ at the compactification scale. (author).

20055 (SLAC–378, pp. 123-142) **Top quark topics.** Kane, G.L. (Univ. of Michigan, Ann Arbor (United States)). Stanford Linear Accelerator Center, Menlo Park, CA (United States). Jan 1991. (CONF-900799–: 18. SLAC summer institute on particle physics: heavy quarks and gauge bosons, Stanford, CA (United States), 16-27 Jul 1990). In *Gauge bosons and heavy quarks: Proceedings of Summer Institute on Particle Physics.* 528p. Order Number DE91011248. Source: OSTI; NTIS; INIS.

These lectures survey why the top quark may be unusually interesting if its mass is large. Perhaps the large mass is related to a fundamental role of the top quark. Perhaps it will have non-Standard Model decays, or be sensitive to some new physics.

20056 (SLAC–378, pp. 167-198) **Theoretical topics in B-physics.** Bjorken, J.D. (Stanford Univ., CA (United States)). Stanford Linear Accelerator Center, Menlo Park, CA (United States). Jan 1991. (CONF-900799–: 18. SLAC summer institute on particle physics: heavy quarks and gauge bosons, Stanford, CA (United States), 16-27 Jul 1990). In *Gauge bosons and heavy quarks: Proceedings of Summer Institute on Particle Physics.* 528p. Order Number DE91011248. Source: OSTI; NTIS; INIS.

The bottom quark should need no introduction. Other than the undiscovered top quark, it is by far the most fashionable of the six. There is good reason for this. It is bottom-quark behavior which holds out the most hope of measuring and understanding some of the most fundamental and delicate parameters of the standard model - those having to do with the origin of electroweak mixing - and thereby in all probability also the origin of quark mass. Also interwoven into this is the subject of CP violation, and its proposed interpretation in terms of electroweak mixing. In this section the author shall review the basics of electroweak mixing and how it is impacted by the study of b-quark properties. There are by now many lecture series and workshop proceedings devoted to this topic, the author will not try to be comprehensive, but only hit some highlights.

20057 (SLAC–378, pp. 403-414) **Baryon number violation at high energy in the standard model: Fact or fiction?.** Dine, M. (Univ. of California, Santa Cruz (United States)). Stanford Linear Accelerator Center, Menlo Park, CA (United States). Jan 1991. DOE Contract AC02-83ER40107. (CONF-900799–: 18. SLAC summer institute on particle physics: heavy quarks and gauge bosons, Stanford, CA (United States), 16-27 Jul 1990). In *Gauge bosons and heavy quarks: Proceedings of Summer Institute on Particle Physics.* 528p. Order Number DE91011248. Source: OSTI; NTIS; INIS.

In the standard model, baryon and lepton number are not strictly conserved, due to anomalies. It has long been known that at low energies, the resulting baryon number violating amplitudes are extraordinarily small. A number of authors have suggested that at high temperatures or energies, baryon number violating effects should be enhanced. The author gives simple arguments that while baryon number violation is indeed large at high temperatures, there is no such enhancement at high energies.

Since the startup of the LEP accelerator, providing e^+e^- collisions at center-of-mass energies corresponding to the mass of the Z^0, many searches for new particles have been performed by the four big experiments ALEPH, L3, DELPHI and OPAL. In this talk the author will describe a few of these searches: the search for the sixth quark, and for a new quark from a possible fourth family; the search for the Standard Model Higgs and for Higgs doublets from Super Symmetric models; and the search for excited quarks and leptons. The techniques used in these searches are representative for other searches not described in this talk. The MARK II collaboration at the SLC has performed a series of searches as well. In spite of the low statistics, some of the limits obtained at the SLC are comparable to those from LEP and close to the kinematic limit. However, they are not part of this talk. In anticipation of the conclusion section he should say that no new particles have been found at LEP, and therefore all results are expressed in terms of lower limits, mostly at the 95% confidence level.

20059 (SLAC–378, pp. 431-452) **Review of QCD at LEP.** de Boer, W. (Univ. of Karlsruhe (West Germany)). Stanford Linear Accelerator Center, Menlo Park, CA (United States). Jan 1991. In *Gauge bosons and heavy quarks: Proceedings of Summer Institute on Particle Physics.* 528p. Order Number DE91011248. Source: OSTI; NTIS; INIS.

The author reviews the first round of QCD studies at the e^+e^- collider LEP, which started operating towards the end of last year. These studies at the peak of the Z^0 resonance have proven to be extremely rewarding, not only because of the large statistics available due to the high resonance cross section, but also because of the higher center of mass energy, which allows a much cleaner study of events with multiple jets. For example, 20% of the events show a clean 3-jet structure in which the least energetic jet has an average energy of 20 GeV. Such events originate from quark-antiquark-gluon ($q\bar{q}g$) states, in which the least energetic jet is usually the gluon jet. Therefore, at LEP energies the gluon jets are considerably healthier than at the PEP and PETRA colliders, where the energies were typically three times lower. The higher jet energy gives a better collimation of the jets and therefore a better jet axis determination and separation between the jets. This improves many QCD studies, especially the study of gluon jets and the angular correlations in 4-jet events, from which one can hope to isolate the triple gluon vertex contribution. This gluon self interaction is the hallmark of the non-abelian character of QCD and is thought to be responsible for the confinement of quarks inside the nuclei. The topics to be discussed here are: intermittency; charged multiplicity and rapidity distribution; comparison with fragmentation models; soft gluon coherence; jetmultiplicity studies and the determination of α, determination of α, from the asymmetry in energy-energy correlations; and search for the triple gluon vertex.

We study pair production and decay of supersymmetric particles in e^+e^- collisions at $\sqrt{s} = 500$ GeV, exploring the relevant supersymmetry parameter space. We give numerical predictions for cross sections and important signatures. (authors).

20063 (UWThPh–1991-58) **Introduction.** Bartl, A. (Vienna Univ. (Austria). Inst. fuer Theoretische Physik); Dittmar, M.; Majerotto, W. Vienna Univ. (Austria). Inst. fuer Theoretische Physik. 1991. 9p. Order Number DE92627267. Source: OSTI; NTIS (US Sales Only); INIS.

The following four basic parameters are necessary to specify the SUSY particle sector of the MSSM: m_0, M, μ and tan β. Production cross sections as well as decay rates depend in a characteristic way on these parameters. A systematic study of this dependence in the whole parameter space relevant for this energy is performed. It is been shown that the clean experiments possible at e^+e^- machines and the precisely calculable cross sections will allow us to probe the realization of supersymmetry in this energy range. Concerning the explorable SUSY parameter range, a 500 GeV e^+e^-collider is roughly comparable to the LHC. Whereas at the LHC the strongly interacting SUSY particles up to a high mass can be detected, an e^+e^-collider is best suited for a detailed study of the non-strongly interacting SUSY particles. (authors).

20064 (BONN-IR–91-67) **Studies on the $D^{*\pm}$ production in Z^0 decays.** Geerts, M. Bonn Univ. (Germany). Physikalisches Inst.; Bonn Univ. (Germany). Mathematisch-Naturwissenschaftliche Fakultaet. Dec 1991. 52p. (In German). Order Number DE92511425. Source: OSTI; NTIS (US Sales Only); INIS.

The production of $D^{*\pm}$ mesons in e^+e^- collisions at energies around the Z^0 pole has been investigated with the OPAL detector at LEP. 115 D^* mesons have been found in the decay channel $D^* \to D^0\pi \to (K\pi)\pi$ from about 150 000 multihadronic events, using the small mass difference between D^* and D^0. The cuts, the detection efficiency and different methods for background determination are shown. The D^* energy distribution is determined. D^* mesons are produced predominantly in the fragmentation of charm and bottom quarks. The contribution from b quarks is derived from measurements at LEP and at lower energies, and from Monte Carlo calculations. An average energy fraction of the D^* mesons from primary charm quarks, $<\chi_{c \to D}{}^*> = 0.52 \pm 0.03$, and the Peterson fragmentation parameter $\epsilon_c = 0.038 \pm 0.014$ are found. The partial width of the decay Z^0 into canti c is determined to be Γsub($Z^0 \to$canti c) = (323 ± 70) MeV. (orig.).

20065 (BONN-IR–91-69) **Determination of the momentum distributions of charged hadrons from Z^0 decays by means of dE/dx measurements in the jet chamber of the OPAL detector.** Tesch, N. Bonn Univ. (Germany). Physikalisches Inst.; Bonn Univ. (Germany). Mathematisch-Naturwissenschaftliche Fakultaet. Dec 1991. 71p. (In German). Order Number DE92517032. Source: OSTI; NTIS (US Sales Only); INIS.

Inclusive measurements of momentum distributions of $\pi^\pm$, $K^\pm$ and panti p are presented from an analysis of approximately 145000 hadronic decays of the Z^0 collected in 1990 with the OPAL detector at LEP. The rates of the charged hadrons are determined by simultaneous measurement of the momentum and the energy loss $dE/d\chi$ for each charged track. Fits to the $dE/d\chi$ distributions in several momentum bins are performed using 4 gaussian functions. From the entries under each of these 4 gaussians the rates for the most numerous charged particle types ($e^\pm$, $\pi^\pm + \mu^\pm$, $K^\pm$ and panti p) are calculated and corrected for efficiency and other detector-dependent effects. With these rates the momentum distributions and the fragmentation functions for $\pi^\pm$, $K^\pm$ and panti p are derived and compared to Monte Carlo predictions. Good agreement is found with the JETSET model with the exception of low momentum protons. (orig.).

20066 (BONN-IR–91-73) **Point-shaped and partonic photon at HERA: Simulation calculations for the ZEUS experiment.** Desch, K. Bonn Univ. (Germany). Physikalisches Inst.; Bonn Univ.

(Germany). Mathematisch-Naturwissenschaftliche Fakultaet. Dec 1991. 77p. (In German). Order Number DE92511568. Source: OSTI; NTIS (US Sales Only); INIS.

We investigate cross sections, kinematics and topology of photoproduction events at HERA. Different event generators for pointlike and resolved photon processes are compared. Remarkable effects arise from initial state gluon radiation. An approach to optimize the First Level Trigger of the ZEUS-Experiment for photoproduction physics is given using a full Monte-Carlo simulation of the detector and the trigger logic. The trigger efficiencies are shown to be above 90% for bottom production while the background keeps low. Some aspects of event classification and kinematical reconstruction of photon gluon fusion events are given. (orig.).

20067 (BONN-IR–91-75) **Search for top and leptoquarks in the region of the Z^0 resonance.** Simon, A. Bonn Univ. (Germany). Physikalisches Inst.; Bonn Univ. (Germany). Mathematisch-Naturwissenschaftliche Fakultaet. Nov 1991. 102p. (In German). Order Number DE92517029. Source: OSTI; NTIS (US Sales Only); INIS.

A search for top- and leptoquarks has been performed with data from the OPAL detector at the e^+e^- storage ring LEP using isolated, high momentum leptons as a signature. Leptoquarks, containing lepton and baryon number, decay into a quark and either a charged lepton (e, μ, τ) or a neutrino. In a data sample corresponding to an integrated luminosity of $6.6pb^{-1}$ no evidence for top- or leptoquark production in either of the possible decay modes was obsrved. This places a lower limit of 46.6 GeV on the top-quark mass (47.1 GeV for a forth family b'-quark). For leptoquarks an upper limit of 1.7pb on the production cross section is obtained assuming a branching ratio of 50% for the decay of the leptoquark into the channels with a charged lepton. Allowing all decay modes of the leptoquark pair, including those where the decay products are from different fermion families, lower limits on the leptoquark mass between 41.4 and 46.4 GeV/c^2 at 95% CL are obtained, depending on the effective SU(2)xU(1) invariant couplings assigned to the leptoquark. (orig.).

20068 (CONF-9105238–7) **Electromagnetic lepton-pair production in relativistic collisions.** Albert, C.J. (Texas A and M Univ., College Station, TX (United States)); Ernst, D.J.; Strayer, M.R.; Bottcher, C. Oak Ridge National Lab., TN (United States). [1991]. 13p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. From Conference on computational quantum physics; Nashville, TN (United States); 22-25 May 1991. Order Number DE92011069. Source: OSTI; NTIS; INIS; GPO Dep.

Electromagnetic lepton-pair production in relativistic collisions is studied in an ab initio approach with no free parameters. After a semi-classical approximation to the relative motion of the two incident particles is made, the resulting second-order diagram is calculated using a Monte Carlo technique to evaluate the resulting seven-dimensional integral. We examine the case of electron-positron pair production in π^-p collisions at p_{pl} = 17 GeV. We find that a significant fraction of the measured pairs in this reaction are produced via the magnetic spin-flip current of the proton. Approaches, such as the equivalent photon approximation, which neglect this part of the current predict much too small a cross section. This feature is traced to the cuts imposed in taking the experimental data. Lepton-pair production in the scattering of ^3He, ^4He and ^4He, ^4He is proposed as a clean way of experimentally separating the spin-flip and non-flip processes; predictions are made for these systems.

20069 (CONF-910864–13) **Charge exchange photoproduction and the $a_1(1260)$.** Condo, G.T.; Handler, T.; Blackett, G.R. Tennessee Univ., Knoxville, TN (United States). Dept. of Physics. [1991]. 4p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG05-91ER40627. From 4. international conference on hadron spectroscopy; College Park, MD (United States); 12-16 Aug 1991. Order Number DE92012267. Source: OSTI; NTIS; INIS; GPO Dep.

Although recent analyses of τ-lepton decay and a reanalysis of hadron production data gave consistent results for the mass of the $a_1(\sim1250$ MeV), other results, both experimental and theoretical, have suggested a significantly smaller value for this parameter. The purpose of this talk is to present our data on the charge-exchange photoproduction reaction, $\gamma\rho \rightarrow \Delta^{++}\pi^+\pi^-\pi^-$. Our data derive from a hydrogen bubble chamber experiment, performed at SLAC, utilizing incident photons of average energy 19.3 GeV with a full width at half-maximum of 1.7 GeV.

20070 (DESY–91-109) **Signals of new gauge bosons.** Djouadi, A. (Deutsches Elektronen-Synchrotron (DESY), Hamburg (Germany)); Leike, A.; Riemann, T.; Schaile, D.; Verzegnassi, C. Deutsches Elektronen-Synchrotron (DESY), Hamburg (Germany). Dec 1991. 10p. (CONF-9109374–: Workshop on physics and experiments with linear colliders, Saariselkae (Finland), Sep 1991). Order Number DE92516967. Source: OSTI; NTIS (US Sales Only); INIS.

We analyze signals of additional neutral gauge bosons originating from E_6 and Left-Right models, at a future e^+e^- collider with 500 GeV c.m. energy. Radiative corrections as well as the experimental situation are taken into account. We show that masses considerably higher than the total energy can be probed, and that a discrimination between theoretical models is possible. (orig.).

20071 (DESY–91-128(rev.ed.)) **Radiative corrections for associated ZH production at future e^+e^- colliders.** Kniehl, B.A. Deutsches Elektronen-Synchrotron (DESY), Hamburg (Germany). Nov 1991. 42p. Order Number DE92517037. Source: OSTI; NTIS (US Sales Only); INIS.

The ZF fanti f four-point function is calculated in the one-loop approximation of the standard model and full analytic results are presented. The loop contributions due to both light and new heavy fermions are inspected in detail. The dominant mechanisms of Higgs-boson production from fermions are compared. The effect of radiative corrections on the cross section of fanti f→ZH including bremsstrahlung is studied. The spectrum of hard bremsstrahlung is integrated analytically. The implications for Higgs-boson searches at future e^+e^- colliders in the energy range 200 GeV $\leq \sqrt{s} \leq$ 1.5 TeV, which includes both LEP 2 and the Next Linear Collider, are analyzed. For $M_H<2m_t$ weak corrections in the modified on-mass-shell scheme are generally negative and feebly vary with M_H, while for $M_H>2m_t$, they strongly increase with M_H and may take large positve values. Electromagnetic corrections dramatically reduce the cross section close to the ZH-production threshold, while they may considerably enhance it far above this threshold. (orig.).

20072 (DESY–91-140) **Signals of new gauge bosons at future e^+e^- colliders.** Djouadi, A. (Deutsches Elektronen-Synchrotron (DESY), Hamburg (Germany)); Leike, A.; Riemann, T.; Schaile, D.; Verzegnassi, C. Deutsches Elektronen-Synchrotron (DESY), Hamburg (Germany). Dec 1991. 34p. (CERN-TH–6350/91;ETH-TH–91/43;LMU–91/05). Order Number DE92516966. Source: OSTI; NTIS (US Sales Only); INIS.

We analyze possible indirect signals of additional neutral gauge bosons at future e^+e^-- colliders, concentrating on $SU(2)_L$ x $U(1)_y$ x $U(1)_y$, and $SU(2)_L$ x $SU(2)_R$ x U(1) effective theories. We develop a simple formalism to describe these effects and make a careful study of radiative corrections, in particular initial state radiation, which will be shown to have important implications. To make realistic estimates of the sensitivity to the new gauge boson effects, we use a model detector for e^+e^- annihilation at a center of mass energy of 500 GeV. Using a number of selected physical observable we then show that masses considerably higher than the total energy (up to a factor of 6) can be probed and that distinction between various theoretical models is possible. (orig.).

20073 (DESY–91-154) **Measurement of hot spots inside the proton at HERA and LEP/LHC.** Bartels, J. (Hamburg Univ. (Germany). 2. Inst. fuer Theoretische Physik); Roeck, A. de; Loewe, M. Deutsches Elektronen-Synchrotron (DESY), Hamburg (Germany). Dec 1991. 22p. Contract FONDECYT 0367/90. Order Number DE92516963. Source: OSTI; NTIS (US Sales Only); INIS.

In this paper we discuss the measurement of regions in the proton where the density of small-χ partons is large, called 'hot spots', by means of an associated jet analysis. An analytical estimate of the cross section is presented and the jet kinematics is discussed in the HERA and LEP-LHC frame. A Monte Carlo estimate shows that the number of jets produced in deep inelastic scattering events at HERA, suitable for this analysis, amounts to a few 1000 jets for a data sample with an integrated luminosity of about 10 pb^{-1}. (orig.).

20074 (DESY–91-155) **Probing $WW\gamma$ and $WW\gamma\gamma$ couplings with high energy photon beams.** Choi, S.Y.; Schrempp, F. Deutsches Elektronen-Synchrotron (DESY), Hamburg (Germany). Dec 1991. 14p. (CONF-9109328–: Physics with e^+e^- linear colliders, Hamburg (Germany), 2-4 Sep 1991). Order Number DE92516979. Source: OSTI; NTIS (US Sales Only); INIS.

We examine the potential of a future 500 GeV linear e^+e^- collider for probing anomalous WW_γ and $WW_{\gamma\gamma}$ couplings in the so-called $\gamma(\gamma)$model, corresponding to colliding γe and $\gamma\gamma$ beams from Compton backscattering of laser light. We consider in detail the 'minimal' set (k_γ, λ_γ) of CP conserving anomalous couplings and present first results for the CP violating 'partner' couplings (anti K_γ, anti l_γ) as well. The reactions under consideration are $\gamma e \rightarrow W\nu$, $\gamma\gamma \rightarrow W^+W^-$ and, as a reference, also $e^+e^- \rightarrow W^+W^-$. We discuss the impact of both circular polarization of laser photons and polarized e(anti e) beams. Photon 'beams' due to classical Bremsstrahlung are also studied for comparison. We analyze in detail, how changes of the assumed machine parameters, cuts and systematic errors affect the sensitivity to the anomalous couplings. (orig.).

20075 (DESY–92-004) **$WW\gamma$ couplings from single W-production in polarized e^+e^- collisions.** Philipsen, O. Deutsches Elektronen-Synchrotron (DESY), Hamburg (Germany). Jan 1992. 27p. Order Number DE92517033. Source: OSTI; NTIS (US Sales Only); INIS.

Using the process $e\gamma \rightarrow W\nu$ we study the $WW\gamma$ vertex in $\epsilon^+\epsilon^-$ collisions with polarized beams at a future 500 GeV collider. Analytical expressions for the helicity amplitudes of the process $e\gamma \rightarrow W\nu$ are evaluated and a derivation of the equivalent photon approximation is given for the case of polarized electron beams. The resulting photon spectrum is then used to compute the total cross section as well as various differential distributions for the process $\epsilon^+\epsilon^- \rightarrow \epsilon^+W^-\nu$. Special emphasis is put on the effects of using polarized electron beams and their influence on the sensitivity to anomalous couplings. (orig.).

20076 (DESY–92-005) **Technibaryon production at pp colliders.** Dobado, A. (Universidad Complutense de Madrid (Spain). Dept. de Fisica Teorica); Terron, J. Deutsches Elektronen-Synchrotron (DESY), Hamburg (Germany). Jan 1992. 49p. (UCMFT–10/91). Order Number DE92517039. Source: OSTI; NTIS (US Sales Only); INIS.

If the symmetry breaking sector of the Standard Model is strongly interacting, the low-energy dynamics of the longitudinal components of the weak bosons can be described by a non-linear sigma model with two free parameters. For a large range of these parameters the model supports finite energy solitons called weak Skyrmions or technibaryons. Technibaryons could be produced at the SSC giving rise to exotic experimental signatures since they are stable, heavy and, in some cases, fractional-charged particles. PACS:14.80.-j, 12.50Lr. (orig.).

20077 (DESY–92-007) **Direct CP asymmetries in the decays B→VV from an effective weak hamiltonian.** Kramer, G. (Hamburg Univ. (Germany). 2. Inst. fuer Theoretische Physik); Palmer, W.F. Deutsches Elektronen-Synchrotron (DESY), Hamburg (Germany). Jan 1992. 17p. Contract DE-AC02-76ER01545;BMFT 054HH92P/3. Order Number DE92517040. Source: OSTI; NTIS (US Sales Only); INIS.

We calculate QCD coefficients for the effective operators for B decays at the m_b and m_c scale and use them to calculate branching ratio's, polarization and CP asymmetries in the decay of B mesons to two vector mesons. The numerical results are compared to experimental data. (orig.).

20078 (DESY–92-008) **Search for charm production in direct decays of the Υ(1S) resonance.** Albrecht, H. (Deutsches Elektronen-Synchrotron (DESY), Hamburg (Germany)); Ehrlichmann, H.; Hamacher, T.; Krueger, A.; Nau, A.; Nippe, A.; Nowak, S.; Reidenbach, M.; Schaefer, M.; Schroeder, H.; Schulz, H.D.; Walter, M.; Wurth, R.; Appuhn, R.D.; Hast, C.;.ARGUS Collaboration. Deutsches Elektronen-Synchrotron (DESY), Hamburg (Germany). Jan 1992. 17p. Contract BMFT 054DO51P;BMFT 054ER12P;BMFT 055HD21P;BMFT 054KA17P Order Number DE92517035. Source: OSTI; NTIS (US Sales Only); INIS.

The production of $D^*(2010)^+$ and J/ψ mesons and of prompt leptons has been investigated in e^+e^- interactions at the $\Upsilon(1S)$ resonance energy. The data were collected at the storage ring DORIS II at DESY with the ARGUS detector. We obtain upper limits of $BR^{dr}(\Upsilon(1S) \rightarrow D^*(2010)^{\pm}+X)<0.019$ (for $\chi_p>0.2$) and $BR^{dr}(\Upsilon(1S) \rightarrow J/\psi+X)<0.68x10^{-3}$, both at the 90% confidence level. From the prompt lepton analysis, a model dependent limit of $BR^{dr}(\Upsilon(1S) \rightarrow Y_c+X)<0.034$ (Y_c denoting a charm-containing particle) is derived. (orig.).

20079 (DESY–92-009) **$Z^0 \rightarrow d_i$anti d_j CP asymmetry in a model with an extra vector-like singlet quark.** Roldan, J. (Deutsches Elektronen-Synchrotron (DESY), Hamburg (Germany)); Botella, F.J.; Vidal, J. Deutsches Elektronen-Synchrotron (DESY), Hamburg (Germany). Jan 1992. 17p. (FTUV–92-5;IFIC–92-5). Order Number DE92517036. Source: OSTI; NTIS (US Sales Only); INIS.

We study the CP asymmetry $Z^o \rightarrow d_id_u$anti d_j, $d_j$anti d_i in the context of models with an extra heavy vector-like singlet D quark. We show that values for the asymmetry much larger than the Standard Model predictions can be obtained and possibly checked at LEP with upgraded luminosity or next future high energy colliders. (orig.).

20080 (DESY–92-013) **Search for neutrinoless τ decays.** Albrecht, H. (Deutsches Elektronen-Synchrotron (DESY), Hamburg (Germany)); Ehrlichmann, H.; Hamacher, T.; Krueger, A.; Nau, A.; Nippe, A.; Nowak, S.; Reidenbach, M.; Schaefer, M.; Schroeder, H.; Schulz, H.D.; Walter, M.; Wurth, R.; Appuhn, R.D.; Hast, C.;.ARGUS Collaboration. Deutsches Elektronen-Synchrotron (DESY), Hamburg (Germany). Jan 1992. 29p. Contract BMFT 054DO51P;BMFT 054ER12P;BMFT 055HD21P;BMFT 054KA17P Order Number DE92517044. Source: OSTI; NTIS (US Sales Only); INIS.

Upper limits on branching ratios for six neutrinoless leptonic, 16 semileptonic, two radiative-leptonic, two radiative-hadronic and three purely hardronic τ decays have been determined. The results improve over previously published ones by about a factor of two. For the first time the lepton and baryon previously published ones by about a factor of two. For the first time the lepton and baryon number violating decays $\tau^- \rightarrow$anti $p\gamma$, $\tau^- \rightarrow$anti $p\pi^0$ and $\tau^- \rightarrow$anti $p\eta$ have been investigated. The 90% confidence level (CL) limits for the corresponding branching ratios amount to $2.9x10^{-4}$, $6.6x10^{-4}$ and $1.3x10^{-3}$ respectively. (orig.).

20081 (DESY–92-014) **Non-linear QCD effects in the pomeron parton dynamics.** Ingelman, G. (Uppsala Univ. (Sweden). Dept. of Radiation Sciences); Janson-Prytz, K. Deutsches Elektronen-Synchrotron (DESY), Hamburg (Germany). Jan 1992. 10p. (TSL/ISV–91-0055). Order Number DE92517042. Source: OSTI; NTIS (US Sales Only); INIS.

The x- and Q^2-dependence of the patron structure function of the pomeron is investigated based on perturbative QCD. We demonstrate that a large gluon content and small size of pomeron leads to strong non-linear QCD effects in the Q^2-evolution as described by the Gribov-Levin-Ryskin equation. In diffractive electron-proton scattering at HERA this phenomenon should be observable and is predicted to be of larger magnitude than the corresponding non-linear effect in the proton structure function. (orig.).

20082 (FNAL/C–92/65) **Kaon physics at Fermilab Main Injector.** Hsiung, Y. Fermi National Accelerator Lab., Batavia, IL (United States). Mar 1992. 19p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH03000. (CONF-9112111–1: KEK workshop on rare kaon decay physics, Tsukuba (Japan), 10-11 Dec 1991). Order Number DE92011094. Source: OSTI; NTIS; INIS; GPO Dep.

For high precision and high sensitivity studies of the physics of kaon physics of kaon decays, the important characteristics of the new Main Injector at Fermilab are its high energy (relative to other "factories") and its high intensity. Experiments of this kind are becoming increasingly important in the study of CP violation and for searches for new interactions. An extracted beam of 120 GeV will produce a source of high energy kaons (10–50 GeV) that will not be surpassed in intensity by any facility new under consideration world-wide.

20083 (HEPHY-PUB–550-91) **Slepton and squark production and decay in ep collision at the LHC.** Bartl, A. (Vienna Univ. (Austria). Inst. fuer Theoretische Physik); Majerotto, W.; Oshimo, N.; Moesslacher, B. Vienna Univ. (Austria). Inst. fuer Theoretische Physik. Jun 1991. 25p. (UWThPh–1991-14.). Order Number DE92628519. Source: OSTI; NTIS (US Sales Only); INIS.

We present a detailed study of $e+p \to e+q+X$ and $e+p \to v+q+X$ and the subsequent decays of e,v, and q at the LHC ($\sqrt{s} = 1.4$ TeV). We explore the relevant supersymmetry parameter range. We calculate the cross section as well as the rates for interesting signatures such as the production of one or two leptons on the lepton side. (authors).

20084 (HEPHY-PUB–566-91) **Production and decay of supersymmetric particles at future colliders.** Bartl, A. (Vienna Univ. (Austria). Inst. fuer Theoretische Physik); Majerotto, W.; Moesslacher, B. Vienna Univ. (Austria). Inst. fuer Theoretische Physik. 1991. 34p. (UWThPh–1991-60.). Order Number DE92628511. Source: OSTI; NTIS (US Sales Only); INIS.

We describe how supersymmetric particles could be detected at the new colliders HERA, LEP 200, LHC, SSC, and at the possible future linear e^+e^- collider. We shall present theoretical predictions for production cross sections and decay probabilities, as well as for the important signatures. Our calculations will be based on the Minimal Supersymmetric Standard Model (MSSM) which is the simplest supersymmetric extension of the Standard Model. (authors).

20085 (IFVE-OEF–91-41) **Study on mechanism of X(1740) meson production.** Alde, D. (and others); Binon, F.; Bricman, C. Gosudarstvennyj Komitet po Ispol'zovaniyu Atomnoj Ehnergii SSSR, Serpukhov (USSR). Inst. Fiziki Vysokikh Ehnergij. 1991. 8p. (In Russian). Order Number DE92627299. Source: OSTI; NTIS (US Sales Only); INIS.

New data on the narrow X(1740)-meson which is produced in π^-p charge-exchange reaction at 38 GeV/c momentum and decays into η-pair are presented. The data confirm the existence of this particle. Upper limits are obtained for its width and branching ratios for $\eta'\eta$ and $\pi^0\pi^0$ decay channels. It is shown that X(1740) is produced with very low cross section (1.5 nb) being accompanied by nucleon isobar (probably $\Delta(1232)$). Analogous reaction with a neutron as a recoil has not been observed. One-pion-exchange contribution to the mechanism of X(1740) production is strongly suppressed. 8 refs.

20086 (IFVE-OEF–91-49) **Large-x_F spin asymmetry in π^0 production by 200-GeV polarized protons: E704 experiment at FNAL.** Adams, D.L. (and others); Akchurin, N.; Underwood, D.G. Gosudarstvennyj Komitet po Ispol'zovaniyu Atomnoj Ehnergii SSSR, Serpukhov (USSR). Inst. Fiziki Vysokikh Ehnergij. 1991. 9p. (In Russian). Order Number DE92627300. Source: OSTI; NTIS (US Sales Only); INIS.

Submitted to the journal Phys. Rev. Lett.

The spin asymmetry A_N for inclusive π^0 production by 200 GeV transversely-polarized protons on a liquid hydrogen target has been measured at Fermilab over a wide range of x_F, with $0.5<p_t<2$ GeV/c. At $x_F>0.3$, the asymmetry rises with increasing x_F and reaches a value of $A_N=0.15\pm0.03$ in the region $0.6<x_F<0.8$. An interpretation of this result using a simple parton recombination model suggests that the spin of the proton is carried by its valence quarks. 20 refs.; 3 figs.; 2 tabs.

20087 (IFVE-ONF–91-128) **Simple model for description of the multiplicity distribution in pp, p-barp and meson-proton interactions.** Chikilev, O.G.; Shlyapnikov, P.V. Gosudarstvennyj Komitet po Ispol'zovaniyu Atomnoj Ehnergii SSSR, Serpukhov (USSR). Inst. Fiziki Vysokikh Ehnergij. 1991. 7p. (In Russian). Order Number DE92627301. Source: OSTI; NTIS (US Sales Only); INIS.

Submitted to the journal Yad.Fiz.

The description of experimental data on the negatively charged particle multiplicity distributions in pp, p-barp and meson-proton interactions by means of two-parameter functions deduced from a simple phenomenological model is considered. 18 fers.; 1 fig.; 1 tab.

20088 (IFVE-ONF–91-165) **Search for prompt electron neutrino production in the proton beam-dump on iron with the IHEP-JINR detector.** Anikeev, V.B. (Gosudarstvennyj Komitet po Ispol'zovaniyu Atomnoj Ehnergii SSSR, Serpukhov (USSR). Inst. Fiziki Vysokikh Ehnergij); Bamburov, N.S.; Bozhko, N.I. Gosudarstvennyj Komitet po Ispol'zovaniyu Atomnoj Ehnergii SSSR, Serpukhov (USSR). Inst. Fiziki Vysokikh Ehnergij. 1991. 10p. (In Russian). Order Number DE92627296. Source: OSTI; NTIS (US Sales Only); INIS.

Submitted to Yad. Fiz.

A search for prompt neutrinos in the new proton beam-dump experiment was performed at the IHEP accelerator Protvino for the measurement of the charm production cross section in the interaction of 70 GeV protons with iron nuclei. The IHEP-JINR neutrino calorimeter with fiducial mass 50 t was used a detector. No signal from prompt neutrinos was observed in the detected electron neutrino interactions, which yielded the improved upper limit on the charm production cross section 2.4 μb/nucleon (90% C.L.). This result does not contradict the QCD predictions. 14 refs.; 5 figs.; 1 tab.

20089 (IHEP-OEIUNK–91-95) **Observation of the decay $a_2^-(1320) \to \pi^-\eta'$.** Bityukov, S.I. (Gosudarstvennyj Komitet po Ispol'zovaniyu Atomnoj Ehnergii SSSR, Serpukhov (USSR). Inst. Fiziki Vysokikh Ehnergij); Borisov, G.V.; Vishnevsky, N.K. Gosudarstvennyj Komitet po Ispol'zovaniyu Atomnoj Ehnergii SSSR, Serpukhov (USSR). Inst. Fiziki Vysokikh Ehnergij. 1991. 7p. Order Number DE92627308. Source: OSTI; NTIS (US Sales Only); INIS.

Submitted to Z. Phys., C.

The reaction $\pi^-C \to \pi^-\eta'C$ has been studied at 36 GeV/c. A clear signal for the decay $a_2^-(1320) \to \pi^-\eta'$ is observed in the $\pi^-\eta'$ mass spectrum. The measured ratio of branchings is $BR(a_2^- \to \pi^-\eta')/BR(a_2^- \to \pi^-\eta)=(3.4\pm0.8\pm0.5) \times 10^{-2}$. 6 refs.; 8 figs.

20090 (IHEP-ONF–91-74) **Linear estimates of structure functions from deep inelastic lepton-nucleon scattering data. Part 1: Neutral-charged current muon and electron scattering.** Anikeev, V.B.; Zhigunov, V.P. Gosudarstvennyj Komitet po Ispol'zovaniyu Atomnoj Ehnergii SSSR, Serpukhov (USSR). Inst. Fiziki Vysokikh Ehnergij. 1991. 34p. Order Number DE92627288. Source: OSTI; NTIS (US Sales Only); INIS.

This paper concerns the linear estimation of structure functions from muon(electron)-nucleon scattering. The expressions obtained for the structure functions estimate provide correct analysis of the random error and the bias The bias arises because of the finite number of experimental data and the finite resolution of experiment. The approach suggested may become useful for data handling from experiments at HERA. 9 refs.

20091 (IHEP-ONF–91-79) **Linear estimates of structure functions from deep inelastic lepton-nucleon scattering data. Part 2: Charged current (anti)neutrino scattering.** Anikeev, V.B.; Zhigunov, V.P. Gosudarstvennyj Komitet po Ispol'zovaniyu Atomnoj Ehnergii SSSR, Serpukhov (USSR). Inst. Fiziki Vysokikh Ehnergij. 1991. 38p. Order Number DE92627297. Source: OSTI; NTIS (US Sales Only); INIS.

The paper concerns the linear estimation of structure functions from (anti)neutrino-nucleon scattering. The expressions obtained for the structure functions estimate provide correct analysis of their random error and the bias. The bias arises because of the finite number of experimental data and the finite resolution of experiment. 10 refs.

20092 (IHEP-OTF–91-117) **Direct manifestation of the additional isoscalar bosons in the process $e^+e^- \to$ ff-bar at LEP.** Gershtein, S.S. (Gosudarstvennyj Komitet po Ispol'zovaniyu Atomnoj Ehnergii SSSR, Serpukhov (USSR). Inst. Fiziki Vysokikh Ehnergij); Likhoded, A.A.; Yushchenko, O.P.; Pankov, A.A. Gosudarstvennyj Komitet po Ispol'zovaniyu Atomnoj Ehnergii SSSR, Serpukhov (USSR). Inst. Fiziki Vysokikh Ehnergij. 1991. 6p. Order Number DE92627289. Source: OSTI; NTIS (US Sales Only); INIS.

Submitted to Phys. Lett., B.

The phenomenological manifestation of the additional $Y(Y_L)$ boson arising in the models with the composite structure of electroweak interactions is studied for the process $e^+e^- \rightarrow$ ff-bar at the LEP energies. It is shown that the presence of the additional isoscalar boson, which can provide the explanation of the experimentally observed deviation of R_μ value from the Standard Model predictions at TRISTAN, yields a measurable effect in the cross section of $e^+e^- \rightarrow \mu^+\mu^-$(hadrons) processes at LEP. The increase of statistics for the above processes at TRISTAN and LEP will permit to set an additional limitation on the model parameters. 7 refs.; 6 figs.

20093 (IHEP-OTF--91-148) **Probing the heavy Higgs sector via $\gamma\gamma \rightarrow W_L^+W_L^-$, Z_LZ_L at a TeV linear collider.** Boos, Eh.Eh. (Moskovskij Gosudarstvennyj Univ., Moscow (USSR). Nauchno-Issledovatel'skij Inst. Yadernoj Fiziki); Jikia, G.V. Gosudarstvennyj Komitet po Ispol'zovaniyu Atomnoj Ehnergii SSSR, Serpukhov (USSR). Inst. Fiziki Vysokikh Ehnergij. 1991. 10p. Order Number DE92627290. Source: OSTI; NTIS (US Sales Only); INIS.

Submitted to the journal Phys. Lett., B.

The one-loop amplitudes of the enhanced electroweak strength, $O(g^2M_H{}^2/M_W{}^2)$ or $O(g^2s/M_W{}^2)$, for the reaction $\gamma\gamma \rightarrow Z_LZ_L$, $W_L{}^+W_L{}^-$ in the limit $s, M_H{}^2 >> M_W{}^2$ are calculated. It is found that the corresponding cross sections seem to be sufficiently large to establish a signal for the heavy Higgs boson $M_H \geq 1$TeV. 16 refs.; 3 figs.

20094 (IHEP-OTF--91-163) **Chiral dynamics and hadron scattering at small and large angles.** Troshin, S.M.; Tyurin, N.E. Gosudarstvennyj Komitet po Ispol'zovaniyu Atomnoj Ehnergii SSSR, Serpukhov (USSR). Inst. Fiziki Vysokikh Ehnergij. 1991. 11p. Order Number DE92627302. Source: OSTI; NTIS (US Sales Only); INIS.

Submitted to the Int. J. Mod. Phys. A.

The unified dynamics of hadron scattering at large and small distances is discussed in the framework of the unitarization method based on the introduction of generalized reaction matrix. The picture of hadron interactions used is inspired by the models with spontaneously broken chiral symmetry. 21 refs.; 1 fig.

20095 (INFN-AE--90-15) **Manifestations of heavy extra neutral E_6 gauge bosons in $e^+e^- \rightarrow W^+W^-$ at LEP II.** Pankov, A.A. (Istituto Nazionale di Fisica Nucleare, Trieste (Italy)); Paver, N. Istituto Nazionale di Fisica Nucleare, Rome (Italy). 1990. 11p. Order Number DE92627291. Source: OSTI; NTIS (US Sales Only); INIS.

24 refs.

The manifestations of a new neutral gauge boson (Z') with $M_z' > \sqrt{s}$, which might exist in E_6 models, in the process $e^+e^- \rightarrow W^+W^-$ at LEP II have been sudied. It has been found that the differential cross section is quite sensitive to the existence of a heavy Z'. In particular, $d\sigma/d\cos\theta$ should show the effect of heavier Z' bosons with $M_z' > 350$ GeV as an enhanced effect due to the Z-Z' mixing.

20096 (INFN-AE--91-09) **Measurement of the top mass near the threshold at an e+ e- collider.** Stiegler, V. (Istituto Nazionale di Fisica Nucleare, Trieste (Italy)). Istituto Nazionale di Fisica Nucleare, Rome (Italy). 1991. 17p. Order Number DE92627292. Source: OSTI; NTIS (US Sales Only); INIS.

In this note a method for measuring the top mass at a linear e+ e-collider near the tt production threshold is presented using properties of the tt final states. A resolution on the top mass of $400 MeV/c^2$ with an integrated luminosity of $1 fb^{-1}$ is obtained.

20097 (INFN-AE--91-12) **A measurement of the partial hadronic widths of the Z grade using neural networks.** Bortolotto, C. (Udine Univ. (Italy): Ist. di Fisica); Cosmo, G.; De Angelis, A.; Lihussio, A.; Eerola, P.; Kalkkinen, J. Istituto Nazionale di Fisica Nucleare, Rome (Italy). 1991. 14p. Order Number DE92627309. Source: OSTI; NTIS (US Sales Only); INIS.

19 refs.

From the data collected by the DELPHI detector at LEP during 1990, the hadronic branching fractions of the Z neutral boson into all five known quarks have been measured for the first time in the literature. A classifier based on a feed-forward neural network has been used for separating the handronic decays of the Z neutral into four classes, corresponding to (xxxxx) unresolved, ss, cc, bb. Data on the hard final-state photon radiation have been then used to resolve the decay rate into uu pairs from the decay rate into dd pairs. The preliminary results are consistent with the predictions from the Standard Model. Problems related to the estimate of systematics are discussed.

20098 (INFN-AE--91-15) **How large can be direct CP violation in $K \rightarrow 3\pi$ from chiral perturbation theory.** D'Ambrosio, G. (Istituto Nazionale di Fisica Nucleare, Naples (Italy)); Isidori, G.; Paver, N. Istituto Nazionale di Fisica Nucleare, Rome (Italy). 1991. 8p. Order Number DE92627310. Source: OSTI; NTIS (US Sales Only); INIS.

19 refs.

Using a general parametrization, the size of direct CP violation in charged $K \rightarrow 3\pi$ decays, as it should be expected from chiral perturbation theory including chiral corrections to order p^4 is discussed. These terms are required in order to remove the $\Delta I = 3/2$ suppression . It is argued that the magnitude of these effects for the slope asymmetry, although enhanced by the $\Delta I1/2$ rule, should be at most of the order of 10^{-5}.

20099 (INFN-BE--91-05) **The study of $\nu_e e^-$ scattering with neutrino source.** Broggini, C. (Ist. Nazionale Di Fisica Nucleare, Laboratori Nazionali del Gran Sasso, Assergi (Italy)). Istituto Nazionale di Fisica Nucleare, Rome (Italy). 1991. 4p. Order Number DE92627293. Source: OSTI; NTIS (US Sales Only); INIS.

The possibility of using a radioactive source to study the $\nu_e e^-$ scattering is discussed. In order to have a strong signal in a 100 gr/cm^2 thick liquid scintillator surrounding the source and in order to be sensitive to a low magnetic moment of the neutrino the threshold on the electron recoil energy has to be set very low, around 200 keV. This has two consequences: a huge experimental setup and a big active volume, where the expected signal due to ^{8}Be solar neutrinos is as high as the one produced by a large magnetic moment of the neutrinos from source.

20100 (INIS-mf--13192, pp. 131-134) **Results and plans from hadron colliders - search for the Higgs.** Lobkowicz, F. (Rochester Univ., NY (United States)). Jednota Ceskoslovenskych Matematiku a Fyziku, Prague (Czechoslovakia). 1991. 319p. (CONF-9008243--: 10. conference of Czechoslovak physicists, Brno (Czechoslovakia), 27-31 Aug 1990). In *The tenth conference of Czechoslovak physicists.* Order Number DE92628439. Source: OSTI; NTIS (US Sales Only); INIS.

The finding of the Z and W and the search for the Higgs particle are discussed. The Z decays into a muon pair or an electron pair, and once the two decay particles are identified the mass reconstruction is trivial. A quarter-view is presented of the Texas Supercollider Solenoid detector used for detecting Z particles, and the performance of a similar detector - the CDF facility at the Fermilab Tevatron - is descibed. The detection of the W is more complicated, since it decays into a muon (or electron) and a neutrino which cannot be observed. The "transverse mass" of the W can be determined using only the transverse components of the lepton (muon or electron) momentum and the "missing transverse momentum" which can be found from the momentum conservation in the plane perpendicular to the beams. The Higgs particle, which has as yet not been found, is discussed, as well as the potential experimental methods used for its determination. (Z.S.). 5 figs., 6 refs.

20101 (INIS-mf--13192, pp. 247) **Self-similar processes in high energy physics.** Blazek, M. (Slovenska Akademia Vied, Bratislava (Czechoslovakia). Fyzikalny Ustav). 20102 (INIS-mf--13194, pp. 49-63) **The fractal structure of multihadron production at high energies.** Satz, H. (European

Organization for Nuclear Research, Geneva (Switzerland)). Slovenska Akademia Vied, Bratislava (Czechoslovakia). Fyzikalny Ustav; Komenskeho Univ., Bratislava (Czechoslovakia). Matematicko-Fyzikalna Fakulta; Jednota Slovenskych Matematikov a Fyzikov, Bratislava (Czechoslovakia). 1989. 395p. (CONF-8909475–: Hadron Structure '89, Smolenice (Czechoslovakia), 25-28 Sep 1989). In *Hadron structure '89: Proceedings of the conference.* Order Number DE92628522. Source: OSTI; NTIS (US Sales Only); INIS.

The paper opens with a short general introduction to intermittency and fractal structure and a discussion of how self-similar patterns can arise in particle production. Then it is shown that at high energies, self-similar jet production leads to a universal power law behavior for the multiplicity moments as a function of the relative rapidity $Y/\delta y$, once the rapidity intervals δy are large enough to be outside the usual resonance region ($\delta y \geq 1$-2). Data from the UA5 experiment at CERN (for $\sqrt{s}$ = 200, 546 and 900 GeV) are found to agree very well with the predicted universal behavior. (author) 7 figs., 9 refs.

20103 (INIS-mf–13194, pp. 64-73) **Hadron spectra and collective transverse flow in ultrarelativistic nuclear collisions.** Heinz, U. (Regensburg Univ. (Germany)). Slovenska Akademia Vied, Bratislava (Czechoslovakia). Fyzikalny Ustav; Komenskeho Univ., Bratislava (Czechoslovakia). Matematicko-Fyzikalna Fakulta; Jednota Slovenskych Matematikov a Fyzikov, Bratislava (Czechoslovakia). 1989. 395p. (CONF-8909475–: Hadron Structure '89, Smolenice (Czechoslovakia), 25-28 Sep 1989). In *Hadron structure '89: Proceedings of the conference.* Order Number DE92628522. Source: OSTI; NTIS (US Sales Only); INIS.

The transverse momentum (p_T) spectra of various hadron species measured at Brookhaven in 14.5 A GeV Si+Au collisions and at CERN in 200 A GeV O+Au and S+Al collisions, are integrated in terms of a superposition of local thermal and global collective expansion at the point of particle freeze-out. Comparing spectra of particles with different masses allows for a separation of the thermal and flow components and thus a separate determination of the freeze-out temperature and the expansion velocity. By varying the initial energy and baryon density of the fireball, a particular initial fireball state was identified which simultaneously explains all the observed p_T spectra. (Z.S.) 5 figs., 20 refs.

20104 (INIS-mf–13194, pp. 138-150) **Soft leptons and photons - a selective review.** Thompson, J.A. (Pittsburgh Univ., PA (United States)). Slovenska Akademia Vied, Bratislava (Czechoslovakia). Fyzikalny Ustav; Komenskeho Univ., Bratislava (Czechoslovakia). Matematicko-Fyzikalna Fakulta; Jednota Slovenskych Matematikov a Fyzikov, Bratislava (Czechoslovakia). 1989. 395p. (CONF-8909475–: Hadron Structure '89, Smolenice (Czechoslovakia), 25-28 Sep 1989). In *Hadron structure '89: Proceedings of the conference.* Order Number DE92628522. Source: OSTI; NTIS (US Sales Only); INIS.

While the high transverse momentum (greater than 2 GeV/c) production of "hard" direct photons is well explained by the perturbative calculations of three dominant processes, viz., Compton scattering, annihilation and bremsstrahlung, the very low transverse momentum (less than approximately 0.5 GeV/c) remains a puzzle. Soft particles are not easily measured unambiguously; soft processes require non-perturbative methods and are sensitive to final state interactions and radiative corrections. The major experiments, both completed and pending (low transverse momentum photon production experiments and electron and muon pair experiments), are reviewed in the context of current theoretical ideas, and an exhaustive list of references is given in the following subject groupings: photon experiments, "softy" photon theory, lepton pair experiments, single electron low P_t experiments, Bratislava soft annihilation calculations, pion interferometry, background normalization, and other relevant theory. Sensitivity of the results to background subtraction is discussed. (Z.S.) 3 tabs., 52 refs.

20105 (INIS-mf–13194, pp. 183-202) **The new physics on $\gamma\gamma$- and γe-colliders.** Ginzburg, I.F. (AN SSSR, Novosibirsk (USSR). Inst. Matematiki); Serbo, V.G. Slovenska Akademia Vied, Bratislava (Czechoslovakia). Fyzikalny Ustav; Komenskeho Univ., Bratislava (Czechoslovakia). Matematicko-Fyzikalna Fakulta; Jednota Slovenskych Matematikov a Fyzikov, Bratislava (Czechoslovakia). 1989. 395p. (CONF-8909475–: Hadron Structure '89, Smolenice (Czechoslovakia), 25-28 Sep 1989). In *Hadron structure '89: Proceedings of the conference.* Order Number DE92628522. Source: OSTI; NTIS (US Sales Only); INIS.

The possibility has already been shown of transforming the future linear e^+e^-colliders into $\gamma\gamma$- and γe-colliders with approximately the same energies and luminosities. Experiments on these colliders are discussed which could be used for the observation of new particles and interactions in the TeV region. Particularly discussed are W-physics, "new" W-bosons, the possibility to test the nature of mass in the standard theory by means of the t-quark production, Higgs production - both in the standard model and in models with new contact interaction, superparticles, leptoquarks, composite particles (e.g. scalar, excited electrons,...), strong interaction in the Higgs sector. (author) 1 tab., 4 figs., 11 refs.

20106 (INIS-mf–13194, pp. 117-127) **The decay $\tau \to 3\pi\nu_\tau$ and characteristics of a_1 meson.** Ivanov, Yu.P. (Joint Inst. for Nuclear Research, Dubna (USSR)); Osipov, A.A.; Volkov, M.K. Slovenska Akademia Vied, Bratislava (Czechoslovakia). Fyzikalny Ustav; Komenskeho Univ., Bratislava (Czechoslovakia). Matematicko-Fyzikalna Fakulta; Jednota Slovenskych Matematikov a Fyzikov, Bratislava (Czechoslovakia). 1989. 395p. (CONF-8909475–: Hadron Structure '89, Smolenice (Czechoslovakia), 25-28 Sep 1989). In *Hadron structure '89: Proceedings of the conference.* Order Number DE92628522. Source: OSTI; NTIS (US Sales Only); INIS.

In case of the $\tau \to 3\pi\nu_\tau$, the transition caused by the weak axial-vector hadronic current can be described by a resonant formula of the Breit-Wigner type. It contains all information on the interaction of decay products and has a pole corresponding to the a_1 meson contribution. For the construction of functions of the Breit-Wigner type, the quark model of superconductivity type (QMST) was used. The $a_1 \to \pi\rho$ meson vertex structure was studied on the basis of its connection with a number of related processes, e.g., the radiative decays $a_1 \to \pi\gamma$ and $\pi \to e\nu\gamma$. (Z.S.) 2 tabs., 4 figs., 27 refs.

20107 (INIS-mf–13194, pp. 242-248) **About decays of light mesons into lepton pairs: three-dimensional theory and phenomenology.** Kozlov, G.A. (Joint Inst. for Nuclear Research, Dubna (USSR). Lab. of Theoretical Physics). Slovenska Akademia Vied, Bratislava (Czechoslovakia). Fyzikalny Ustav; Komenskeho Univ., Bratislava (Czechoslovakia). Matematicko-Fyzikalna Fakulta; Jednota Slovenskych Matematikov a Fyzikov, Bratislava (Czechoslovakia). 1989. 395p. (CONF-8909475–: Hadron Structure '89, Smolenice (Czechoslovakia), 25-28 Sep 1989). In *Hadron structure '89: Proceedings of the conference.* Order Number DE92628522. Source: OSTI; NTIS (US Sales Only); INIS.

Probabilities of the decays of η, K_L into lepton + antilepton were calculated within a quark-loop model with a relativistic quark-meson vertex function. An exact QCD modification was proposed for the confinement interaction. In constructing a possible mechanism of interaction between quarks in quarkonium, the effective kernel of confinement was assumed to be characterized by the same color and spin dependence for one-gluon exchange and an r^2-behavior of the interaction potential. (Z.S.) 3 tabs., 11 refs.

20108 (INIS-mf–13194, pp. 342-349) **Entropy scaling and multifractal analysis of multiplicity distributions.** Simak, V. (Ceskoslovenska Akademie Ved, Prague (Czechoslovakia). Fyzikalni Ustav); Sumbera, M.; Zborovsky, I. Slovenska Akademia Vied, Bratislava (Czechoslovakia). Fyzikalny Ustav; Komenskeho Univ., Bratislava (Czechoslovakia). Matematicko-Fyzikalna Fakulta; Jednota Slovenskych Matematikov a Fyzikov, Bratislava (Czechoslovakia). 1989. 395p. (CONF-8909475–: Hadron Structure '89, Smolenice (Czechoslovakia), 25-28 Sep 1989). In *Hadron structure '89: Proceedings of the conference.* Order Number DE92628522. Source: OSTI; NTIS (US Sales Only); INIS.

Entropy scaling of multiplicity distributions is reviewed and shown to be a special case of a more general set of multifractal measures. As an example the energy dependence of the maximum of multiplicity distribution is discussed. (author) 4 figs., 15 refs.

20109 (INIS-mf–13194, pp. 308-312) **$K_L \to \pi^0 e^+e^-$ and CP-violation.** Pich, A. (Valencia Univ. (Spain). Dept. de Fisica Teorica). Slovenska Akademia Vied, Bratislava (Czechoslovakia).

Fyzikalny Ustav; Komenskeho Univ., Bratislava (Czechoslovakia). Matematicko-Fyzikalna Fakulta; Jednota Slovenskych Matematikov a Fyzikov, Bratislava (Czechoslovakia). 1989. 395p. (CONF-8909475–: Hadron Structure '89, Smolenice (Czechoslovakia), 25-28 Sep 1989). In *Hadron structure '89: Proceedings of the conference.* Order Number DE92628522. Source: OSTI; NTIS (US Sales Only); INIS.

The $K_L \to \pi^0 e^+ e^-$ decay appears to be an ideal candidate to look for new signs of CP violation within the standard model. The present state of theoretical predictions on this decay mode, both for CP-violating and CP-conserving contributions, is reviewed. (author) 2 figs., 14 refs.

20110 (INIS-SU–312, pp. 35-54) **Physics of nucleon resonances and pion photoproduction $\gamma N \to N\pi$.** Barannik, V.P. (AN Ukrainskoj SSR, Kharkov (Ukraine). Nucleon resonances are considered as systems consisting of three quarks; four quarks and one antiquark; three quarks and one gluon as well as excitation of pion field in soliton models. Mutipole analyses of pion photoproduction on nucleons are discussed and the results of determining spiral amplitudes of nucleon resonance photoexcitation are presented. A problem of full-scale experiment design for more accurate determination of photoexcitation amplitudes of nucleon resonances and for search of hybrid baryons is considered. Observables corresponding to two polarized particles in the reactions of photoproduction of charged and neutral pions on nucleons at photon energy from 250 to 1160 MeV are presented. 64 refs.; 7 figs.; 4 tabs.

20111 (IS-T–1586) **A study of isolated photons in Z^0 hadronic decays using the DELPHI detector at LEP.** Holmes, R. Ames Lab., IA (United States). 25 Feb 1992. 126p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-82. Order Number DE92012583. Source: OSTI; NTIS; INIS; GPO Dep.

We present a study of the production of energetic isolated photons in the reaction $e^+e^- \to Z^0 \to q\bar{q}\gamma$ using the DELPHI detector at LEP. Within the context of the Standard Model, our results for final state radiation show no evidence for anomolous photon production due to rare or new processes. We present a comparison of our data with these theoretical expectations or present upper limits at the 95% CL on the cross section times the branching ratio to hadrons and a photon for the rare or new processes: (1) σ $(e^+e^- \to Z^0 \to H^0\ \gamma) \cdot \mathrm{BR}\ (H^0 \to q\bar{q})$; (2) σ $(e^+e^- \to Z^0 \to q\ q^*) \cdot \mathrm{BR}\ (q^* \to q\ \gamma)$; (3) σ $(e^+e^- \to Z^0 \to Z^*\ \gamma) \cdot \mathrm{BR}\ (Z^* \to q\bar{q})$.

20112 (ITF–89-46) **High-energy elastic scattering of polarized photons.** Jenkovszky, L.L.; Sergeev, V.S.; Struminskij, B.V. AN Ukrainskoj SSR, Kiev (Ukraine). Inst. Teoreticheskoj Fiziki. 1989. 8p. (In Russian). Order Number DE92627303. Source: OSTI; NTIS (US Sales Only); INIS.

In the framework of a Regge-type model it is shown that agreement with the polarization data in pp scattering requires the contribution from the anomalous chromomagnetic moment of the pomeron. 6 refs.

20113 (ITP–89-76) **Hadronic processes with large transfer momenta and quark counting rules in multiparticle dual amplitude.** Akkelin, S.V.; Kobylinskij, N.A.; Martynov, E.S. AN Ukrainskoj SSR, Kiev (Ukraine). Inst. Teoreticheskoj Fiziki. 1989. 24p. Order Number DE92627304. Source: OSTI; NTIS (US Sales Only); INIS.

A dual N-particle amplitude satisfying the quark counting rules for the processes with large transfer momenta is constructed. The multiparticle channels are shown to give an essential contribution to the amplitude decreasing power in a hard kinematic limit. 19 refs.; 9 figs.

20114 (ITP–90-42) **Asymptotic behaviour of a rescattering series for nonlinear reggeons.** Akkelin, S.V.; Martynov, E.S. AN Ukrainskoj SSR, Kiev (Ukraine). Inst. Teoreticheskoj Fiziki. 1990. 13p. Order Number DE92627305. Source: OSTI; NTIS (US Sales Only); INIS.

A series of elastic re-scattering (both quasi-eikonal and U-matrix ones) for reggeons with nonlinear trajectories are estimated asymptotically. The calculations are performed for models of supercritical and dipole pomerons. A weak dependence of the series of re-scattering on reggeon trajectory nonlinearity is revealed. 13 refs.; 3 figs.

20115 (KEK-PROC–91-8, pp. 84-93) **Analytical approach to single selectron production.** Jimbo, Masato (Fujita Health Univ., Toyoake, Aichi (Japan)); Katuya, Mituaki. In *Proceedings of the KEK summer institute on high energy phenomenology.* 145p. Order Number DE92782188. Source: OSTI; NTIS (US Sales Only); INIS.

Analytical cross section formulae for the single selectron production in electron-positron collisions are proposed by using the real photon approximation and by keeping the photino mass. (author).

20116 (LA–12262-T) **Measurement of neutrino electron scattering and inverse beta-decay of carbon using neutrinos from stopped muon decay.** Krakauer, D.A. Los Alamos National Lab., NM (United States). Apr 1992. 244p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. Order Number DE92011451. Source: OSTI; NTIS; INIS; GPO Dep.

Thesis was submitted to University of Maryland.

Electron-neutrino electron elastic scattering and two-body electron- neutrino carbon scattering reactions were observed using a 15 ton fine-grained detector and neutrinos from μ^+ decay at rest. The data was obtained during an exposure to neutrinos produced in LAMPF proton beam-stop. Based on identification of 262±46 $\nu_e e^-$ events the total cross-section for $\nu_e e^- \to \nu_e e^-$ was measured to be $\sigma(\nu_e E^-) = (3.09 \pm 0.54(\mathrm{stat}) \pm 0.39(\mathrm{syst})) \times 10^{-43}\ \mathrm{cm}^2$. The interference between the weak charged and neutral currents was measured for the first time. The interference was found to be destructive, with a magnitude 0.97±0.22 times the value predicted by the WSG theory. The total cross-section was also used to measure $\sin^2\theta_W = 0.24 \pm 0.06(\mathrm{stat}) \pm 0.04(\mathrm{syst})$. The data restricts the maximum allowed value of the neutrino magnetic moment to be less than 1.3×10^{-9} Bohr magnetrons for ν_e and 8.8×10^{-10} for ν_{mu}. In a separate analysis, 182±22 ${}^{12}C(\nu_e,e^-)\ {}^{12}N(gs)$ events with subsequent ${}^{12}N(\beta^+)\ {}^{12}C$ were observed, corresponding to a total cross-section, $\sigma(\nu_e\ {}^{12}C \to e^-\ {}^{12}N(gs)) = (1.03 \pm 0.12(\mathrm{stat}) \pm 0.10(\mathrm{sys})) \times 10^{-41}\ \mathrm{cm}^2$. This was the first observation of ν_e-induced transitions between specific nuclear states. The results is good agreement with theoretical predictions.

20117 (MPI-PhE–91-09) **A review of experimental results on intermittency.** Schmitz, N. Max-Planck-Institut fuer Physik, Muenchen (Germany). Werner-Heisenberg-Institut. Dec 1991. 19p. (CONF-9109221–: 21. international symposium on multiparticle dynamics, Wuhan (China), 23-27 Sep 1991). Order Number DE92516501. Source: OSTI; NTIS (US Sales Only); INIS.

After discussing in the Introduction some more recent developments in the field of intermittency in multiparticle production, results are presented from the various experiments on the following topics: factorial moments, regularities of intermittency indices, dependence on multiplicity, dependence on transverse momentum, Ochs-Wosiek relation, comparison with models, and factorial correlators. (orig.).

20118 (PHE–91-09) **Leptoquark production at linear colliders.** Bluemlein, J. (Institut fuer Hochenergiephysik, Zeuthen (Germany)); Rueckl, R. Institut fuer Hochenergiephysik, Zeuthen (Germany). Dec 1991. 8p. Contract BMFT 055ZT91I-01. (CONF-9109328–: Physics with e^+e^- linear colliders, Hamburg (Germany), 2-4 Sep 1991; MPI-Ph–91-107). Order Number DE92516978. Source: OSTI; NTIS (US Sales Only); INIS.

The production of scalar and vector leptoquarks is studied in e^+e1- annihilation in the energy range of future linear colliders. We assume general dimensionless $SU_c(3)xSU_L(2) \times U_y(1)$ invariant couplings conserving baryon and lepton number. At integrated luminosity of L = 10 fb^{-1} such leptoquarks can be observed nearly up to the phase space limit. Furthermore, scalar and vector leptoquarks can be distinguished by the angular distributions. (orig.).

20119 (PHE–91-014) **Structure functions and low Q^2 physics at HERA.** Roeck, A. de (Max-Planck-Institut fuer Physik, Muenchen (Germany). Werner-Heisenberg-Institut fuer Physik); Klein, M. Institut fuer Hochenergiephysik, Zeuthen (Germany). Dec 1991. 24p. Contract BMFT 05-5ZT91I/01. (CONF-9109330–: Hadron structure '91, Stara Lesna (Czechoslovakia), 16-20 Sep 1991). Order Number DE92516790. Source: OSTI; NTIS (US Sales Only); INIS.

Important new insights into the hadron structure are expected from the data which will be collected at the electron-proton storage ring HERA at DESY, Hamburg. In this paper the physics opportunities for cross section related measurements at HERA are reviewed. Emphasis is put on the derivation of the proton structure functions, on the QCD effects expected in the newly accessible low χ region and on almost real photoproduction physics. (orig.).

20120 (PITHA–91/18) **Cross-sections and masses of the intermediate vector bosons in UA1.** Boehrer, A. Technische Hochschule Aachen (Germany). Lehrstuhl fuer Experimentalphysik 3A und 3. Physikalisches Inst.; Technische Hochschule Aachen (Germany). Mathematisch-Naturwissenschaftliche Fakultaet. Oct 1991. 125p. Order Number DE92516575. Source: OSTI; NTIS (US Sales Only); INIS.

In this analysis we study the cross-sections of $W^{\pm} \rightarrow \mu^{\pm}\nu$ and $Z^0 \rightarrow \mu^{+}\mu^{-}$ and the masses of the intermediate vector bosons in panti p collisions. Related subjects, such as the total width of the $W^{\pm}$, which test the Standard Model are discussed. (orig.).

20121 (RAL–91-085) **Scalar mesons and kaons in ϕ radiative decay and their implications for studies of CP violation at DAϕNE.** Brown, N.; Close, F.E. Rutherford Appleton Lab., Chilton (United Kingdom). Dec 1991. 16p. Order Number DE92627311. Source: OSTI; NTIS (US Sales Only); INIS.

We had become interested in the possibility that radiative decays of the ϕ meson might be so prominent that they would undermine the primary aim of the ϕ factory, namely the study of (CP) charge-parity violation. As a result of previous work we can now be confident that the CP programme will not be significantly affected by this possibility. At the same time, the DAϕNE facility will create opportunities for studying ϕ radiative processes, in particular the production of the enigmatic scalar resonances, in their own right. (author).

20122 (RAL–91-090) **Remarks on the exotic U-meson.** Chan Hongmo (Rutherford Appleton Lab., Chilton (United Kingdom)); Tsou Sheungtsun. Rutherford Appleton Lab., Chilton (United Kingdom). Dec 1991. 9p. Order Number DE92627312. Source: OSTI; NTIS (US Sales Only); INIS.

In expectation of imminent results from the new hyperon beam experiment at CERN concerning the exotic U-meson at 3.1 GeV, we propose a detailed program of experimental tests to check the suggestion that U is a qqq-barq-bar "M-diquonium" state. Apart from some very characteristic decay modes, the U is expected to occur together with several analogous states with various quantum numbers to which it is intimately related. (author).

20123 (RAL–92-004) **Pole counting and resonance classification.** Morgan, D. Rutherford Appleton Lab., Chilton (United Kingdom). Jan 1992. 15p. Order Number DE92628526. Source: OSTI; NTIS (US Sales Only); INIS.

S-wave resonances occurring close to an inelastic threshold can be classified according to the number of nearby poles they possess. One then has a useful possibility of distinguishing dynamical alternatives by objective appeal to data. Making this quantitative entails developing suitable effective range expansions for various realizations of potential scattering. A key application is deciding the make-up of f_0 (976) (S^*). (author).

20124 (SLAC–378, pp. 1-34) **Z decays and tests of the standard model.** Cahn, R.N. (Univ. of California, Berkeley (United States)). Stanford Linear Accelerator Center, Menlo Park, CA (United States). Jan 1991. (CONF-900799–: 18. SLAC summer institute on particle physics: heavy quarks and gauge bosons, Stanford, CA (United States), 16-27 Jul 1990). In *Gauge bosons and heavy quarks: Proceedings of Summer Institute on Particle Physics.* 528p. Order Number DE91011248. Source: OSTI; NTIS; INIS.

Fundamental aspects of Z decays are reviewed. The effects of radiative corrections, both from ordinary QED and from the electroweak interactions are considered from an elementary point of view, but in some detail. The possibility of mixing with an extra Z boson and the effect that technicolor might have are discussed. Additional information that will be obtained from measurements of the W in collider experiments is considered.

20125 (SLAC–378, pp. 97-122) **Studies of the interactions of electroweak gauge bosons.** Burke, D.L. (Stanford Univ., CA (United States)). Stanford Linear Accelerator Center, Menlo Park, CA (United States). Jan 1991. (CONF-900799–: 18. SLAC summer institute on particle physics: heavy quarks and gauge bosons, Stanford, CA (United States), 16-27 Jul 1990). In *Gauge bosons and heavy quarks: Proceedings of Summer Institute on Particle Physics.* 528p. Order Number DE91011248. Source: OSTI; NTIS; INIS.

Exploration of the electroweak interactions of quarks and leptons has ascended along the energy frontier for the past two decades, and has recently culminated the elegant results obtained with the SLC and LEP electron-positron colliders operating at the Z^0. The SU(2) isospin symmetry of the fermion sector is nearly completely known. It remains to uncover the top quark, and determine the precise relationship between the electroweak eigenstates and those of the mass operator embodied in the Cabibbo-Kobayashi-Maskawa formalism. While the authors parameterization of the fermion sector of nature is becoming increasingly clear, they have no empirical knowledge of the interactions and possible structures of gauge bosons (with the exception, of course, of the massless photon). In this series of lectures they will review the origins of the interactions between gauge bosons that exist within the Standard Model, and explore signatures of new physics that might appear in the gauge-boson sector. Special attention will be given to pair-production of gauge bosons in e^+e^- annihilation at center-of-mass energies above those available at LEP II, and to scattering processes that could possibly be studied at very high energy e^+e^- and hadron colliders in the next century.

20126 (SLAC–378, pp. 199-237) **Experimental aspects of B physics.** Drell, P.S. (Cornell Univ., Ithaca, NY (United States)). Stanford Linear Accelerator Center, Menlo Park, CA (United States). Jan 1991. (CONF-900799–: 18. SLAC summer institute on particle physics: heavy quarks and gauge bosons, Stanford, CA (United States), 16-27 Jul 1990). In *Gauge bosons and heavy quarks: Proceedings of Summer Institute on Particle Physics.* 528p. Order Number DE91011248. Source: OSTI; NTIS; INIS.

The first experimental evidence for the existence of the b quark came in 1977 from an experiment at FNAL in which high energy protons were scattered off of hadronic targets. A broad resonance, was observed in the plot of the invariant mass of muon pairs seen in a double armed spectrometer. The width of the resonance was greater than the energy resolution of the apparatus and the data were interpreted as the three lowest lying quark anti-quark bound states of a new quark flavor: b flavor, which stands for either beauty or bottom. The $b\bar{b}$ bound states were called the Υ, Υ', and Υ''. The Υ(1S), Υ(2S) and Υ(3S) and the other bound states of the $b\bar{b}$ system are interesting objects. By studying the energy splitting and decay modes (much like an atomic physicist studies the spectrum of an atom) one learns a great deal about the QCD potential that binds the quarks. However, the authors interest will be in center of mass energies of the Υ(4S) and beyond, where there is sufficient energy to make B mesons: mesons made from a b quark and a light quark, and which carry the b quantum number. The organization of these notes will be as follows: first the author will discuss the basic properties of the B mesons: how they are produced and where; basic features of B decay; and basic properties of the mesons such as mass, lifetime, and spin. In the next section, he will concentrate on the semi-leptonic decays and of the B mesons, which is a very rich field from which a great deal of information has been gleaned, and he will discuss the measurements of the CKM matrix elements that can be made with B mesons. The final chapter will try to look into the future.

20127 (SLAC–378, pp. 259-272) **Rare kaon decays.** Ritchie, J.L. (Univ. of Texas, Austin (United States)). Stanford Linear Accelerator Center, Menlo Park, CA (United States). Jan 1991. (CONF-900799–: 18. SLAC summer institute on particle physics: heavy quarks and gauge bosons, Stanford, CA (United States), 16-27 Jul 1990). In *Gauge bosons and heavy quarks: Proceedings of Summer Institute on Particle Physics.* 528p. Order Number DE91011248. Source: OSTI; NTIS; INIS.

Recent experiments on rare kaon decays are described, with emphasis on the program at the Brookhaven National Laboratory Alternating Gradient Synchrotron. New limits on the modes $K_L \rightarrow \mu e$ and $K_L \rightarrow ee$ and a preliminary new measurement of the $K_L \rightarrow \mu\mu$ branching ratio are presented from AGS Experiment 791. Other modes, including $K^+ \rightarrow \pi^+\mu^+e^-$, $K^+ \rightarrow \pi^+$ + nothing, and $K_L \rightarrow \pi^0 e^+e^-$, which have been the focus of other AGS experiments, are also discussed.

20128 (SLAC–378, pp. 273-286) **CP- violation in K^0 - Decays at CERN.** Holder, M. (Univ. Siegen (West Germany)). Stanford Linear Accelerator Center, Menlo Park, CA (United States). Jan 1991. (CONF-900799–: 18. SLAC summer institute on particle physics: heavy quarks and gauge bosons, Stanford, CA (United States), 16-27 Jul 1990). In *Gauge bosons and heavy quarks: Proceedings of Summer Institute on Particle Physics.* 528p. Order Number DE91011248. Source: OSTI; NTIS; INIS.

Two experiments will be discussed, NA31 and CP-LEAR. The main results of NA31 on CP- and CPT-violation will be reviewed. A recent measurement of the decay $K_L \rightarrow \pi^0\gamma\gamma$, which has some relevance for CP-violation in the decay $K_L \rightarrow \pi^0 e^+e^-$, will be presented in some detail, and a new proposal for a more precise measurement of ϵ'/ϵ will be outlined. For CP-LEAR the aims of the experiment and a brief status report will be given.

20129 (SLAC–378, pp. 287-303) **Recent K^0 decay results from Fermilab E-731.** Barker, A.R. (Univ. of Chicago, IL (United States)). Stanford Linear Accelerator Center, Menlo Park, CA (United States). Jan 1991. (CONF-900799–: 18. SLAC summer institute on particle physics: heavy quarks and gauge bosons, Stanford, CA (United States), 16-27 Jul 1990). In *Gauge bosons and heavy quarks: Proceedings of Summer Institute on Particle Physics.* 528p. Order Number DE91011248. Source: OSTI; NTIS; INIS.

The status of the E-731 experiment is reviewed. In addition, preliminary results are reported from searches for three rare decays of the K^0, using data collected by the E-731 Collaboration during the 1987-88 fixed-target run at Fermilab. Branching ratio results are presented for the decays ${K_{L,S}}^0 \rightarrow \pi^+\pi^-\gamma$, as well as for the decay ${K_L}^0 \rightarrow \pi^\pm\pi^0 e^\mp \nu(\bar{\nu})$. An upper limit is derived for the decay $\pi^0 \rightarrow e^+e^-$, using the processes ${K_L}^0 \rightarrow \pi^0\pi^-\pi^0$ to tag π^0 mesons.

20130 (SLAC–378, pp. 319-328) **Review of recent results on heavy flavor production.** Kwan, S. (Fermi National Accelerator Lab., Batavia, IL (United States)). Stanford Linear Accelerator Center, Menlo Park, CA (United States). Jan 1991. (CONF-900799–: 18. SLAC summer institute on particle physics: heavy quarks and gauge bosons, Stanford, CA (United States), 16-27 Jul 1990). In *Gauge bosons and heavy quarks: Proceedings of Summer Institute on Particle Physics.* 528p. Order Number DE91011248. Source: OSTI; NTIS; INIS.

Recent experimental results on photo- and hadroproduction of heavy flavor particles are reviewed. After a short introduction on the recent advances in the theoretical ideas describing the production of heavy flavors, current experimental techniques used in heavy flavor search in fixed target experiments are briefly discussed. New results on the production characteristics, production cross section and on the A-dependence of the open and hidden charm cross section are presented.

20131 (SLAC–378, pp. 329-336) **Weak matrix elements and the determination of the weak mixing angles.** Wise, M.B. (California Inst. of Tech., Pasadena (United States)). Stanford Linear Accelerator Center, Menlo Park, CA (United States). Jan 1991. (CONF-900799–: 18. SLAC summer institute on particle physics: heavy quarks and gauge bosons, Stanford, CA (United States), 16-27 Jul 1990). In *Gauge bosons and heavy quarks: Proceedings of Summer Institute on Particle Physics.* 528p. Order Number DE91011248. Source: OSTI; NTIS; INIS.

In the limit of QCD where heavy quark masses go to infinity new symmetries appear which enable one to predict the hadronic form factors that occur in the semileptonic decays $\bar{B} \rightarrow De\bar{\nu}_e$, $\bar{B} \rightarrow D^*e\bar{\nu}_e$ and $\Lambda_c e\bar{\nu}_e$. These results may eventually improve our ability to extract the weak mixing angles from experimental data on $\bar{B}$ and Λ_b decay.

20132 (SLAC–378, pp. 357-373) **Recent results from ARGUS.** Kapitza, H. (Carelton Univ., Ottawa, Ontario (Canada)). Stanford Linear Accelerator Center, Menlo Park, CA (United States). Jan 1991. (CONF-900799–: 18. SLAC summer institute on particle physics: heavy quarks and gauge bosons, Stanford, CA (United States), 16-27 Jul 1990). In *Gauge bosons and heavy quarks: Proceedings of Summer Institute on Particle Physics.* 528p. Order Number DE91011248. Source: OSTI; NTIS; INIS.

Some recent results are reported from the ARGUS experiment, operated at the e^+e^- storage ring DORIS II at DESY. In an updated analysis of semileptonic $b \rightarrow u$ decays direct evidence for such transitions was obtained through reconstruction of a complete event. A study of the lepton energy spectra in $\tau^- \rightarrow e^- \nu\bar{\nu}$ and $\tau^- \rightarrow \mu\, \nu\bar{\nu}$ decays yielded a value for the Michel parameter which is in good agreement with a standard V - A coupling at the τ-ν_τ-W vertex. A parity violating asymmetry was measured in τ decays into three charged pions which shows that the τ neutrino has negative helicity. The Micro Vertex Drift Chamber was installed as a new hardware component of the ARGUS detector. Initial results concerning backgrounds and chamber performance are presented.

20133 (SLAC–378, pp. 375-381) **Neutrino lepton physics with the CHARM2 detector.** Dore, U. (Univ. La Sapienza, Roma (Italy)). Stanford Linear Accelerator Center, Menlo Park, CA (United States). Jan 1991. (CONF-900799–: 18. SLAC summer institute on particle physics: heavy quarks and gauge bosons, Stanford, CA (United States), 16-27 Jul 1990). In *Gauge bosons and heavy quarks: Proceedings of Summer Institute on Particle Physics.* 528p. Order Number DE91011248. Source: OSTI; NTIS; INIS.

The CHARM2 detector has been designed to obtain a precision determination of the electro-weak mixing parameter sin $2\theta_W$ via a measurement of the ratio of the cross section of the purely leptonic neutral current processes $\nu_\mu + e \rightarrow \nu_\mu + e$ and $\bar{\nu}_\mu + e \rightarrow \bar{\nu}_\mu + e$. The main difficulties for the study of these processes come from that very small value of the cross section and from the high level of background. The single electron events produced in the $\nu_\mu - e$ scattering must be extracted from the deep inelastic neutrino nucleon scattering ones that have a three order of magnitude higher rate. To match these requirements CHARM2 [2] has been built as a high mass, low Z, high granularity, sampling calorimeter (total mass 692 tons). The detector has been exposed to the CERN WB neutrino beam starting from 1987. Neutrino and antineutrino runs have been alternated every few days to ensure uniform detector behavior and a total of 2 x 10 19 protons on target have been collected in 87,88,89,90 runs. The analyses that will be presented here refer to 87,88,89 data (75% of the total statistics). The low Z of the target material allows a precise measurement of muon direction, while the high granularity of the detector makes possible a detailed study of vertex activity. These characteristics of the CHARM2 calorimeter together with the muon momentum information have allowed the author to study two leptonic processes in which the neutrino electron interaction gives rise to final states containing only muons and precisely (1) Inverse muon decay $\nu_\mu + e - \rightarrow \mu - +\nu_e$ (2) Muon pair production in the electromagnetic field of a nucleus. $\nu + A \rightarrow \nu + \mu + +\mu - +A$. This process, usually called neutrino trident production, can be seen from the point of weak interactions as $\nu_\mu\mu$ elastic scattering.

20134 (SLAC–378, pp. 383-402) **Recent results from the three TRISTAN experiments.** Itoh, Ryosuke (KEK, Tsukuba (Japan)). Stanford Linear Accelerator Center, Menlo Park, CA (United States). Jan 1991. (CONF-900799–: 18. SLAC summer institute on particle physics: heavy quarks and gauge bosons, Stanford, CA (United States), 16-27 Jul 1990). In *Gauge bosons and heavy quarks: Proceedings of Summer Institute on Particle Physics.* 528p. Order Number DE91011248. Source: OSTI; NTIS; INIS.

Recent results from the three TRISTAN experiments are presented. The measurements of the forward-backward asymmetry are reviewed. The results of QCD studies are discussed on the test of the existence of the triple gluon coupling and on the determination of Λ/MS using a new Monte Carlo. The various studies on the fragmentation are also presented.

20135 (SLAC–378, pp. 453-471) **Electroweak interactions at LEP.** Borgia, B. (Univ. La Sapienza, Roma (Italy)). Stanford Linear Accelerator Center, Menlo Park, CA (United States). Jan 1991. (CONF-900799–: 18. SLAC summer institute on particle physics: heavy quarks and gauge bosons, Stanford, CA (United States), 16-27 Jul 1990). In *Gauge bosons and heavy quarks: Proceedings of Summer Institute on Particle Physics.* 528p. Order Number DE91011248. Source: OSTI; NTIS; INIS.

Electroweak interaction at LEP are a subject based on a wealth of data, given the success of the CERN e^+e^- storage ring. The author will report on the results from the four experiments, ALEPH, DELPHI, L3 and OPAL after the analysis of about 1/2 of the data collected in 1989 and 1990. The review will cover the electroweak aspects of the process $e^+e^- \to Z^* \to f\bar{f}$ where the fermions can be either quarks or leptons. The analysis of experimental data is based on the determination of the cross section integrated on the solid angle and on the asymmetry of forward-backward leptons in the final state. In this game the knowledge of the center mass energy is fundamental as the determination of the luminosity by which the event rate is normalized to compute the absolute cross section. Therefore a specific attention is given to these subjects.

20136 (UWThPh–1991-44) **Chargino production at LEP 200.** Bartl, A. (Vienna Univ. (Austria). Inst. fuer Theoretische Physik); Fraas, H.; Majerotto, W.; Moesslacher, B. Vienna Univ. (Austria). Inst. fuer Theoretische Physik. 29 Oct 1991. 22p. (HEPHY-PUB–561-91.). Order Number DE92627294. Source: OSTI; NTIS (US Sales Only); INIS.

We study chargino production and decay in the energy region of LEP 200, exploring the relevant supersymmetry parameter space. We give numerical predictions for the cross sections and for the signatures $l^+ + l^- + p$, l+jet+p, jet+jet+p. New formulae are presented relating chargino masses and couplings to the supersymmetry parameters. (authors).

20137 (ZfK–753) **Estimates of dielectron production in pp and pd reactions at 1-2 GeV.** Kaempfer, B. (Zentralinstitut fuer Kernforschung, Rossendorf (Germany)); Titov, A.I.; Toneev, V.D. Zentralinstitut fuer Kernforschung, Rossendorf (Germany). Dec 1991. 9p. Order Number DE92516506. Source: OSTI; NTIS (US Sales Only); INIS.

Dielectron production rates are estimated in pp and pd collisions at 1-2 GeV. Uncertainties concerning off-shell T-matrix and form factors are discussed, and material is presented which can be compared with experimental data. Measurements of cross sections are needed to get reliable input in theoretical models for heavy-ion collisions. (orig.).

20138 (ANL-HEP-CP–92-17) **Prospects for long baseline neutrino oscillation experiments.** Goodman, M. Argonne National Lab., IL (United States). [1991]. 37p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38. (CONF-9111141–7: Workshop on long-baseline neutrino oscillations, Batavia, IL (United States), 17-20 Nov 1991). Order Number DE92011833. Source: OSTI; NTIS; INIS; GPO Dep.

Several recent development have motivated consideration of neutrino experiments located hundreds or thousand of kilometers from an accelerator. The motivations and experimental challenges for such experiments are examined. Three proposals for using the Fermilab Main Injector are compared. The requirements on mass, distance and resolution for an "ideal" detector for such an experimental are considered.

20139 (BNL–46979) **Current status of the E(1420)/ι(1440) and future prospects of the g_T decaying into $\phi\phi$.** Chung, S.U. Brookhaven National Lab., Upton, NY (United States). Dec 1991. 15p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH00016. (CONF-9110318–1: SuperLEAR workshop, Zurich (Switzerland), 9-12 Oct 1991). Order Number DE92011475. Source: OSTI; NTIS; INIS; GPO Dep.

A survey is given of the current status of the $f_1(1420)$/E and the $\eta(1440)/\iota$ in the channels of $K\bar{K}\pi$ and $\eta\pi\pi$. There is now strong evidence that the $\eta(1440)/\iota$ is split into two $J^{PC} = o^{-+}$ states in the 1.4–1.5 GeV range with the lower-mass state coupling mostly to $a_0(980)\pi$ whereas the upper-mass state couples mainly to $K^*(890)\bar{K}$. Both of them cannot be quarkonia. It appears very likely that the $f_1(1420)$/E is an S-wave $K^*(890)\bar{K}$ molecule with a strong overlap with the $a_0(980)/\delta$. It is thought that one or more of the $J^{PC} = 1^{++}$ $f_2(2010)/g_T$, $F_2(2300)/g_T{}'$ and $f_2(2340)/g_T{}''$ states decaying into $\phi\phi$ may be the tensor glueball. The future prospects at BNL and elsewhere for further experimental work on these on other exotic states coupling to $\phi\phi$ are discussed.

This report contains a survey article of resonance production by the Crystal Ball Collaboration from J. K. Bienlein, an article on CELLO results for $\gamma\gamma\Pi^*p^{*+-}$- from J. Harjes, a survey article on the production of scalar and tensor mesons in two-photon collisions, and an article on the study of the a_1 resonance by τ decays, the last two articles are both from H. Kolanoski. See hints under the relevant topics. (HSI).

20141 (FNAL/C–92/26A) **The many aspects of neutrino physics.** Frieman, J.A. Fermi National Accelerator Lab., Batavia, IL (United States). Jan 1992. 15p. Sponsored by USDOE, Washington, DC (United States); National Aeronautics and Space Administration, Washington, DC (United States). DOE Contract AC02-76CH03000. Grant NAGW-2381. (CONF-9111210–Summ.: Many aspects of neutrino physics; Workshop on long-baseline neutrino oscillations, Batavia, IL (United States); Batavia, IL (United States), 14-17 Nov 1991; 17-20 nov 1991; CONF-9111141–Summ.). Order Number DE92011735. Source: OSTI; NTIS; INIS; GPO Dep.

In mid-November, over seventy physicists gathered at Fermilab for an informal workshop on the Many Aspects of Neutrino Physics, which dovetailed with and also helped lay the groundwork for the succeeding more narrowly focused conference on Long Baseline Neutrino Oscillations. The workshop indeed covered many of the interrelated aspects of neutrino physics: 17 keV neutrinos (experiments, theoretical models, and astrophysical constraints), neutrino properties (double beta decay experiments, neutrino magnetic moments), neutrinos from/as weakly interacting massive particles (WIMPs) in cosmology and astrophysics, atmospheric neutrinos, and solar neutrinos. In the following, I provide a brief and thoroughly biased account of only some of the many interesting developments discussed at the workshop.

20142 (FNAL/C–92/62) **The 17 keV neutrino and neutrino tagging.** Bernstein, R.H. Fermi National Accelerator Lab., Batavia, IL (United States). Feb 1992. 3p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH03000. (CONF-9111141–6: Workshop on long-baseline neutrino oscillations, Batavia, IL (United States), 17-20 Nov 1991). Order Number DE92011281. Source: OSTI; NTIS; INIS; GPO Dep.

P-788 at FNAL proposed to search for neutrino oscillations in a tagged neutrino line. A K_L beam and the decay modes $K_L \to \pi\mu\nu_\mu$ and $K_L \to \pi e\nu_e$ provides the neutrino flux. An upstream tagging spectrometer then identifies the hadron and lepton and reconstructs the K_L decay; the lepton identification will specifies the neutrino as ν_e or ν_μ and distinguishes ν from $\bar{\nu}$ at the decay vertex. A neutrino detector modeled after an existing deep-inelastic scattering spectrometer (rates have been worked out for the CCFR apparatus) can be used to associate the K_L with a neutrino interaction, measure the neutrino energy, and analyze outgoing muons. Monte Carlo studies show that 30K ν_e and 20K ν_μ could be obtained in two fixed target runs at the Tevatron.

20143 (IFVE-ONF--91-139) **Search for light neutral scalar and pseudoscalar particles in pFe interactions at 70 GeV.** Anikeev, V.B. (Gosudarstvennyj Komitet po Ispol'zovaniyu Atomnoj Ehnergii SSSR, Serpukhov (USSR). Inst. Fiziki Vysokikh Ehnergij); Bamburov, N.S.; Bozhko, N.I. Gosudarstvennyj Komitet po Ispol'zovaniyu Atomnoj Ehnergii SSSR, Serpukhov (USSR). Inst. Fiziki Vysokikh Ehnergij. 1991. 25p. (In Russian). Order Number DE92627317. Source: OSTI; NTIS (US Sales Only); INIS.

Submitted to the Z. Phys.

A search has been performed for weakly interacting neutral light scalar and pseudoscalar particles in a proton beam dump experiment. No positive signal is observed. Limits on the mass and lifetime of these particles are set in the frame of the Standard Model and its minimal supersymmetric extension. The Higgs particle of the SU(2L)xU(1) Standard Model is excluded for masses in the range 1 MeV<m<80 MeV at 95% CL. Limits on the Peccei Quinn like axions are also derived. 33 refs.; 13 figs.; 2 tabs.

20144 (IHEP-OEF--91-11) **On determination of the top quark mass at hadron colliders.** Kiryunin, A.E.; Moiseev, A.M. Gosudarstvennyj Komitet po Ispol'zovaniyu Atomnoj Ehnergii SSSR, Serpukhov (USSR). Inst. Fiziki Vysokikh Ehnergij. 1991. 43p. Order Number DE92627320. Source: OSTI; NTIS (US Sales Only); INIS.

A study has been made on a possibility to determine the top quark mass at hadron colliders by measuring the jets from its hadronic decay in a calorimeter. For this purpose 5000 events of the channel pp-bar → tt-bar+X → (W$^+$b)(W$^-$b-bar)+X → (qq-barb)(l$^-$$\nu$-barb-bar)+X (and charge conjugated to it) at $\sqrt{s}$=6 TeV has been produced with the ISAJET Monte Carlo program. Some features of top quark production and decay have been analyzed. The factors affecting the multijet invariant mass resolution have been analyzed in detail. It has been found that the bremsstrahlung that comes off the final state partons and background of overlapping gluon jets significantly reduces the precision of jet spectroscopy. A special algorithm of hard jet finding, optimized for top quark searching and measuring its mass in three jet invariant mass distributions, has been developed. As a result it has been shown that the systematic error of the m_t measurement at hadron colliders can not be less than 3 GeV. 16 refs.; 17 figs.; 8 tabs.

20145 (INIS-mf--13192, pp. 127-128) **Properties of and searching for glueballs.** Lanik, J. (Slovenska Akademia Vied, Bratislava (Czechoslovakia). Fyzikalny Ustav). Jednota Ceskoslovenskych Matematiku a Fyziku, Prague (Czechoslovakia). 1991. 319p. (In Slovak). (CONF-9008243--: 10. conference of Czechoslovak physicists, Brno (Czechoslovakia), 27-31 Aug 1990). In *The tenth conference of Czechoslovak physicists.* Order Number DE92628439. Source: OSTI; NTIS (US Sales Only); INIS.

Although the possible existence of glueballs as bound states of gluons was suggested as early as the starting stage of quantum chromodynamics, it has so far not been proved experimentally. Experimental evidence of a glueball component in the hadron spectrum would provide a powerful, perhaps decisive, proof of the correctness of quantum chromodynamics as the fundamental theory of strong interactions. Theoretical considerations associated with the search for glueballs and evidencing their properties are summarized. (Z.S.). 16 refs.

Matematicko-Fyzikalna Fakulta; Jednota Slovenskych Matematikov a Fyzikov, Bratislava (Czechoslovakia). 1989. 395p. (CONF-8909475--: Hadron Structure '89, Smolenice (Czechoslovakia), 25-28 Sep 1989). In *Hadron structure '89: Proceedings of the conference.* Order Number DE92628522. Source: OSTI; NTIS (US Sales Only); INIS.

The standard current quark mass ratio $m_s/m_{aver}\approx$25 Mev and scale $m_{aver}\approx$5 MeV does not explain (i) the observed ratio $f_K/f_\pi\approx1.25$, (ii) the empirical nucleon σ term of 60 MeV, (iii) the chiral-limiting nucleon mass of ≈900 MeV, and (iv) the small observed 5% Goldberger-Treiman discrepancy. (author) 10 refs.

20151 (INIS-mf--13194, pp. 329-335) **On contribution of instantons to nucleon sum rules.** Dorokhov, A.E. (Joint Inst. for Nuclear Research, Dubna (USSR)); Kochelev, N.I. Slovenska Akademia Vied, Bratislava (Czechoslovakia). Fyzikalny Ustav; Komenskeho Univ., Bratislava (Czechoslovakia). Matematicko-Fyzikalna Fakulta; Jednota Slovenskych Matematikov a Fyzikov, Bratislava (Czechoslovakia). 1989. 395p. (CONF-8909475--: Hadron Structure '89, Smolenice (Czechoslovakia), 25-28 Sep 1989). In *Hadron structure '89: Proceedings of the conference.* Order Number DE92628522. Source: OSTI; NTIS (US Sales Only); INIS.

The contribution of instantons to nucleon QCD sum rules is discussed. The nucleon mass is proportional to the inverse size of the instanton $1/\rho_c$. The agreement between the mass obtained by calculation and by experiment testifies that the effective size of instantons in the QCD vacuum corresponds to the instanton liquid model with $\rho_c \approx 1.6$ Gev^{-1}. It is shown that the contribution of instantons does not provide a stabilization of the sum rules and leads to the formation of the nucleon as a bound state of quarks in the instanton field. Thus the QCD sum rules confirm the conclusion about the dominant role of instanton-induced interactions in the hadron spectroscopy obtained earlier within the quark model. (Z.S.) 3 figs., 17 refs.

20152 (INIS-mf--13194, pp. 336-341) **Instantons and EMC-effect for spin-dependent function $g_1{}^p(x)$.** Dorokhov, A.E. (Joint Inst. for Nuclear Research, Dubna (USSR)); Kochelev, N.I. Matematicko-Fyzikalna Fakulta; Jednota Slovenskych Matematikov a Fyzikov, Bratislava (Czechoslovakia). 1989. 395p. (CONF-8909475--: Hadron Structure '89, Smolenice (Czechoslovakia), 25-28 Sep 1989). In *Hadron structure '89: Proceedings of the conference.* Order Number DE92628522. Source: OSTI; NTIS (US Sales Only); INIS.

It is shown that the polarization contribution of the instanton vacuum of QCD gives a 70% contribution to the nucleon helicity. It is, however, cancelled by the contribution of sea quarks which are polarized against the nucleon spin. (author) 20 refs.

20153 (INIS-mf--13194, pp. 377-386) **Bound states of relativistic particles and Regge trajectories within the potential approach.** Bykov, A.A. (AN SSSR, Moscow (USSR). Fizicheskij Inst.); Mironov, A.D.; Royzen, I.I. Slovenska Akademia Vied, Bratislava (Czechoslovakia). Fyzikalny Ustav; Komenskeho Univ., Bratislava (Czechoslovakia). Matematicko-Fyzikalna Fakulta; Jednota Slovenskych Matematikov a Fyzikov, Bratislava (Czechoslovakia). 1989. 395p. (CONF-8909475--: Hadron Structure '89, Smolenice (Czechoslovakia), 25-28 Sep 1989). In *Hadron structure '89: Proceedings of the conference.* Order Number DE92628522. Source: OSTI; NTIS (US Sales Only); INIS.

The accuracy of the potential description of the bound states of relativistic particles is estimated. A rough potential for two spinless light quark system is proposed in the framework of the Klein-Gordon equation. The general properties of the energy spectrum are outlined analytically, and numerical calculations of quite realistic Regge trajectories are presented. The magnitude of spin corrections is discussed phenomenologically. (author) 2 tabs., 3 figs., 11 refs.

20154 (INIS-mf--13194, pp. 323-328) **Quark masses in heavy quarkonia potential models.** Motz, G. (Humboldt-Universitaet, Berlin (Germany). Sektion Physik); Lewin, K. Slovenska Akademia Vied, Bratislava (Czechoslovakia). Fyzikalny Ustav; Komenskeho Univ., Bratislava (Czechoslovakia). Matematicko-Fyzikalna Fakulta; Jednota Slovenskych Matematikov a Fyzikov, Bratislava (Czechoslovakia). 1989. 395p. (CONF-8909475--: Hadron Structure '89, Smolenice (Czechoslovakia), 25-28 Sep 1989). In *Hadron structure '89: Proceedings of the conference.* Order Number DE92628522. Source: OSTI; NTIS (US Sales Only); INIS.

At present a number of potential models exists. In each model the quark masses are introduced as free parameters to be fitted to the data together with those parameters which directly appear in the central nonrelativistic potential. The possibility is discussed of introducing equal constituent quark masses for all models considered. (Z.S.) 1 tab., 17 refs.

20155 (INIS-mf--13194, pp. 366-376) **On confining aspects of relativistic configurational space.** Kagramanov, E.D. (AN Azerbajdzhanskoj SSR, Baku (Azerbaijan). Inst. Fiziki); Nagiyev, S.M.; Mir-Kasimov, R.M. Slovenska Akademia Vied, Bratislava (Czechoslovakia). Fyzikalny Ustav; Komenskeho Univ., Bratislava (Czechoslovakia). Matematicko-Fyzikalna Fakulta; Jednota Slovenskych Matematikov a Fyzikov, Bratislava (Czechoslovakia). 1989. 395p. (CONF-8909475--: Hadron Structure '89, Smolenice (Czechoslovakia), 25-28 Sep 1989). In *Hadron structure '89: Proceedings of the conference.* Order Number DE92628522. Source: OSTI; NTIS (US Sales Only); INIS.

An attempt is presented to show that the confinement phenomenon can be a feature inherent to the theory of strong interactions. The consideration is based on the concept of the relativistic configuration space. (Z.S.) 16 refs.

20156 (INIS-SU--312, pp. 55-68) **Quadrupole amplitudes of electromagnetic excitation of Δ-isobar on nucleon.** Kulish, Yu.V. (AN Ukrainskoj SSR, Kharkov (Ukraine). Fiziko-Tekhnicheskij Inst.). Gosudarstvennyj Komitet po Ispol'zovaniyu Atomnoj Ehnergii SSSR, Moscow (USSR); Gosudarstvennyj Komitet po Ispol'zovaniyu Atomnoj Ehnergii SSSR, Moscow (USSR). Tsentral'nyj Nauchno-Issledovatel'skij Inst. Informatsii i Tekhniko-Ehkonomicheskikh Issledovanij po Atomnoj Nauke i Tekhnike. 1989. 116p. (In Russian). In *Nuclear-physical researches (Theory and experiments): Scientific-technical collection.* Order Number DE92001360. Source: OSTI; NTIS (US Sales Only); INIS.

A problem of quadrupole amplitudes of $\gamma N \rightarrow \Delta$ and $eN \rightarrow e\Delta$ transitions is considered. The results of computing quadrupole amplitudes in theoretical approaches: dispersion sum rules, nonrelativistic quark models, bag models and soliton models are discussed. The results of determining quadrupole amplitudes which correspond to Δ-isobar production in the processes of photo- and electroproduction of pions on nucleons are presented. 41 refs.; 3 tabs.

20157 (INIS-SU--312, pp. 102-115) **Electromagnetic transition form factor N → Δ(1232).** Gakh, G.I. (AN Ukrainskoj SSR, Kharkov (Ukraine). Fiziko-Tekhnicheskij Inst.). Gosudarstvennyj Komitet po Ispol'zovaniyu Atomnoj Ehnergii SSSR, Moscow (USSR); Gosudarstvennyj Komitet po Ispol'zovaniyu Atomnoj Ehnergii SSSR, Moscow (USSR). Tsentral'nyj Nauchno-Issledovatel'skij Inst. Informatsii i Tekhniko-Ehkonomicheskikh Issledovanij po Atomnoj Nauke i Tekhnike. 1989. 116p. (In Russian). In *Nuclear-physical researches (Theory and experiments): Scientific-technical collection.* Order Number DE92001360. Source: OSTI; NTIS (US Sales Only); INIS.

The status of the studies into the determination of electromagnetic form factor of $\gamma' N \rightarrow \Delta(1232)$ transition is reviewed. A procedure of deriving this form factor from experimental data on inelastic scattering of electrons by protons and deuterons is considered. The reaction of Δ-isobar production on deuteron, $d(e, e')\Delta N$, is investigated in depth. 42 refs.; 8 figs.

20158 (ITP--89-56) **New semiclassical approximation for quarkonia Regge-trajectories.** Kobylinskij, N.A.; Stepanov, S.S.; Tutik, R.S. AN Ukrainskoj SSR, Kiev (Ukraine). Inst. Teoreticheskoj Fiziki. 1989. 12p. Order Number DE92627321. Source: OSTI; NTIS (US Sales Only); INIS.

A new semiclassical method, complimentary to WKB one, used to derive quarkonia Regge-trajectories within the Schroedinger equation is proposed. Based upon the $\hbar$-expansion, the simple recursion formulas are presented. The results computer for some confinement potentials illustrate the speed and accuracy of the technique. 14 refs.; 3 tabs.

20159 (ITP--90-34) **New approach to electromagnetic signals from quark-gluon plasma.** Makhlin, A.N. AN Ukrainskoj SSR, Kiev (Ukraine). Inst. Teoreticheskoj Fiziki. 1990. 25p. Order Number DE92627322. Source: OSTI; NTIS (US Sales Only); INIS.

The sources of discrepancies of different calculations of the dilepton emission rate from quark-gluon plasma are analyzed. The analysis proceeds from the first principles and at this level the roots of discrepancies are found. The standard renormalization procedure is shown to be ill suited for relativistic thermal theories. A new approach based on the scale invariance of neutral QGP is proposed. 15 refs.

20160 (ITP--90-78) **Uniterization of supercritical pomeron and odderon.** Akkelin, S.V.; Martynov, E.S. AN Ukrainskoj SSR, Kiev (Ukraine). Inst. Teoreticheskoj Fiziki. 1990. 8p. Order Number DE92627323. Source: OSTI; NTIS (US Sales Only); INIS.

The methods used to unitarize supercritical pomeron and odderon at fixed momenta are considered. The crossing-odd component of the unitarized amplitude is shown to vanich in a power way with energy increase if either intercepts or slopes of the bare pomeron and odderon trajectories are unequal. 6 refs.

20161 (KEK-PROC--91-8, pp. 94-101) **Matrix-form-independent study of three-family quark mass matrices.** Koide, Yoshio (Shizuoka Univ. (Japan). Dept. of Physics). National Lab. for

High Energy Physics, Tsukuba, Ibaraki (Japan). Oct 1991. (CONF-9008241–: KEK summer institute on high energy phenomenology, Tsukuba (Japan), 21-25 Aug 1990). In *Proceedings of the KEK summer institute on high energy phenomenology.* 145p. Order Number DE92782188. Source: OSTI; NTIS (US Sales Only); INIS.

From a matrix-form-independent study of 3 x 3 quark mass matrices, a general sum rule is derived. I would like to talk about my recent work stated above, but more than half of my talk will be devoted to 'Introduction' (the motivation, etc.). (author).

20162 (KEK-PROC–91-8, pp. 102-114) **Where to look for the origin of fermion masses.** Murayama, Hitoshi (Tokyo Univ. (Japan). Dept. of Physics). National Lab. for High Energy Physics, Tsukuba, Ibaraki (Japan). Oct 1991. (CONF-9008241–: KEK summer institute on high energy phenomenology, Tsukuba (Japan), 21-25 Aug 1990). In *Proceedings of the KEK summer institute on high energy phenomenology.* 145p. Order Number DE92782188. Source: OSTI; NTIS (US Sales Only); INIS.

The importance of the search for the origin of the fermion masses at the future e^+e^- linear colliders with $\sqrt{s}$ = 0.5 - 1.5 TeV is emphasized. The process $e^+e^- \rightarrow$tt-barZ^0 serves a good place for the search if the Higgs boson lies above the threshold of its decay into tt-bar, however the background from continuum production is severe for heavy Higgs boson. The process $e^+e^- \rightarrow \nu_e\nu$-bar$_e$tt-bar has smaller cross section, however it is an ideal place to study the effect of the Yukawa coupling for any m_H. Search strategies for the strongly interacting W_L/Z_L/top sector are discussed. (author).

20163 (SLAC–378, pp. 473-487) **Recent results on W - Physics from the UA2 experiment at the CERN $p\bar{p}$ - collider.** Jakobs, K. (CERN, Geneva (Switzerland)). Stanford Linear Accelerator Center, Menlo Park, CA (United States). Jan 1991. (CONF-900799–: 18. SLAC summer institute on particle physics: heavy quarks and gauge bosons, Stanford, CA (United States), 16-27 Jul 1990). In *Gauge bosons and heavy quarks: Proceedings of Summer Institute on Particle Physics.* 528p. Order Number DE91011248. Source: OSTI; NTIS; INIS.

The UA2 experiment at the CERN $p\bar{p}$ collider has collected large samples of W and Z events during the 1988 and 1989 data taking periods at $\sqrt{s}$ = 630 GeV. These data have been used to measure the production cross sections and the transverse momentum distributions of W and Z bosons and to compare them to QCD predictions. In the framework of the Standard Model, the ratio between and W and Z production cross section has been used to determine the total width of the W boson. A precise measurement of the ratio between the W and Z masses has been extracted, leading to a new determination of the weak mixing angle $\sin^2\theta_w$. A combination of this result with recent measurements of the Z mass at e^+e^- colliders results in a precise absolute measurements of the W mass.

During the past decade, both the science program and the experimental facilities at LAMPF have undergone some significant changes. This report is a concise description of the current research initiatives and of new directions being proposed for the future research program at LAMPF. Traditionally the LAMPF physics program has explored nuclear systems with hadronic probes: pions, protons, and neutrons. In recent years the exploitation of the intense lepton beams – neutrinos and muons – at LAMPF has received increasing emphasis. Explorations of issues in electroweak physics and precision tests of quantum electrodynamics have been significant areas of experimentation. A new concept of the program is an increased emphasis on the role of weak interactions in hadronic systems. Here the electroweak force is treated as a well-understood interaction, which can be used to reveal the wave functions and properties of hadronic systems. The manifestations of the electroweak force may be discussed either in the language of quarks interacting through the exchange of W and Z bosons or in terms of nucleons interacting through the exchange of mesons described by both strong and weak coupling constants. Taken together, these topics provide a rich and vital program of fundamental interest in nuclear physics. Atomic physics, astrophysics, materials research, among others, are additional components of the LAMPF-LANSCE experimental activities. Research highlights of this broad program and the research tools available at LAMPF are described briefly in this report.

Recent progress in the performance of laser-driven source of polarized deuterium is described. Optical pumping of potassium atoms followed by spin exchange scattering with deuterium atoms in a high magnetic field and RF transitions in a medium field was found to produce an intense, highly spin-polarized beam of deuterium atoms. In particular, the atomic polarization of deuterium was determined to be 73±3% at an intensity of 2.1 × 10^{17} Atomsis. The RF transition efficiency was measured and found to be 92±5%.

20170 (ANU-P–1089) **Shape co-existence from the structure of the yrast band in ^{174}Pt.** Dracoulis, G.D. (Australian

National Univ., Canberra (Australia). Research School of Physical Sciences); Fabricius, B.; Stuchbery, A.E.; Macchiavelli, A.O.; Korten, W.; Azaiez, F.; Rubel, E.; Deleplanque, M.A.; Diamond, R.M.; Stephens, F.S. Accepted for publication in Physical Review C.

Excited states in the neutron-deficient nucleus ^{174}Pt have been identified up to spin 14. An irregular yrast sequence was observed beginning with a high $2^+ \rightarrow 0^+$ energy. It can be interpreted as the result of a change from a weakly-deformed ground state band, to a well-deformed rotor, near spin 6. 11 refs., 2 tabs., 4 figs.

20171 (ANU-P–1096) **A shape coexistence interpretation of phenomenology of alignment curves in Os and Re isotopes.** Bark, R.A. Australian National Univ., Canberra (Australia). Research School of Physical Sciences. Jun 1991. 25p. Order Number DE92627347. Source: OSTI; NTIS (US Sales Only); INIS.

Accepted for publication in Journal of Physics G.

A model of shape coexistence, based on an intruder $\pi(h_{9/2})^2$ excitation, previously applied to explain low-frequency upbending phenomena in ^{171}Re and ^{172}Os, is extended to heavier Os and Re isotopes. A phenomenological three-band mixing analysis of the yrast bands of even Os nuclei and the $5/2^+[402]$ and $9/2^-[514]$ bands of the neighbouring Re isotopes is used to deduce the excitation energies of the proposed intruder configuration as a function of neutron number. These are shown to be qualitatively consistent with an $(h_{9/2})^2$ excitation. The implications of this model for other nuclei are discussed. 53 refs., 1 tab., 7 figs.

Microscopic structure of high spin states in deformed nuclei is yet to be understood both experimentally and theoretically. However, for nuclei near the closed shell the structure of the high spin states is known to be pure shell model states involving a few valence nucleons. A critical survey of the transitions from high spin states in region starting from Po to Ra indicate complete absence of any E2 collective transitions, so characterisitic of the deformed nuclei. A challenging experimental problem is to identify the onset for such E2 collectivity in these region. (author). 10 refs., 3 figs., 6 tabs.

Source: OSTI; NTIS (US Sales Only); INIS.

High spin states have been an area of active research in the last ten years. Availability of high quality heavy ion beams and precision multielement detector arrays has resulted in the identification of very high spin states with super-collective E2 transition rates. Hosts of new bands have been identified and electromagnetic transition rates are now known with great accuracy. Some of these findings are difficult to understand in the traditional models. These developments and the possible theoretical models which can enhance understanding of these new experimental findings are reviewed. Microscopic models dealing with signature effects, violation of K selection rules and superdeformed bands are discussed. (author). 31 refs., 6 figs., 2 tabs.

20177 (INIS-mf–13179, pp. 175-186) **Signatures of parity mixing among the nuclear states.** Saha, S. (Tata Inst. of Fundamental Research, Bombay (India)). Department of Atomic Energy, Bombay (India). Board of Research in Nuclear Physics. 1991. 310p. (CONF-9012123–: DAE symposium on nuclear physics, Madras (India), 1-4 Dec 1990). In *Proceedings of the symposium on nuclear physics (held at Madras during December 1-4 1990): Invited talks/seminars. Vol. 33A (1990).* Order Number DE92001359. Source: OSTI; NTIS (US Sales Only); INIS.

Space-time invariance properties of the strong, electromagnetic and weak interactions have been questioned and put to rigorous tests for the last 30 years since the breakdown of parity symmetry was observed in the leptonic weak decays. Although the symmetry violations in the leptonic and the semileptonic processes are well understood and good agreement between theory and experiments are found, it is still an open problem in the nonleptonic sector where evidences of parity mixing of the nuclear states are found in the heavier systems but considerable challenge exists in the theoretical interpretations of these data. On the other hand, significant progresses have been made in the theoretical estimates of the observables of parity mixing in lighter systems, but the experimental results are still not conclusive enough to verify these predictions. In this presentation, an overview of the theories of parity mixing for the systems ranging from the lightest to the heavier nuclei is discussed followed by a review of the relevant experiments to extract the extent of parity mixing in these systems. A side by side comparison of the experimental results and the theoretical estimates is made next and finally, the recent progresses and future directions in this field are discussed. (author). 23 refs., 1 fig., 2 tabs.

20178 (INIS-mf–13179, pp. 104-121) **Superdeformation in the A≈190 region.** Garg, Umesh (Notre Dame Univ., IN (United States). Dept. of Physics). Department of Atomic Energy, Bombay (India). Board of Research in Nuclear Physics. 1991. 310p. (CONF-9012123–: DAE symposium on nuclear physics, Madras (India), 1-4 Dec 1990). Source: OSTI; NTIS (US Sales Only); INIS.

Following the initial discovery, with the Argonne-Notre Dame γ-ray facility, of a superdeformed band (SD) in the nucleus ^{191}Hg, an enormous amount of experimental and theoretical work has been performed in this region in a relatively short period. SD bands have since been established in at least ten nuclei viz. sup(189- 194)Hg, sup(193,194)Tl, and sup(194,196)Pb and the present understanding can be summarized as follows: (1)All data currently available support the interpretation that ^{192}Hg is a 'doubly magic' SD nucleus, i.e. large shell gaps exist for Z=80 and N=112 at a deformation of $\beta_2 \approx 0.55$. (2)For the lighter Hg isotopes, the SD well becomes increasingly shallower and ^{189}Hg is most likely the last SD nucleus in this region. (3)The dynamic moment of inertia as a function of rotational frequency shows a gradual increase (by almost 40%) in most bands. This increase can be attributed to the alignment of pairs of nucleons in high-j intruder orbitals. (4)Recent data on ^{193}Hg provide indications that octupole degrees of freedom play an important role in the SD minimum. (5)As in the A=150 region, SD bands with energies very similar (within 1-2 keV) have been found in the neighboring nuclei: the excited bands of ^{191}Hg have 'twins' in ^{193}Hg. This has been explained in terms of intrinsic spin alignment and pseudo-spin symmetry. Details of some of these results are presented. (author). 19 refs., 10 figs., 1 tab.

20179 (INIS-mf–13179, pp. 122-138) **Recent development in dynamic deformation theory.** Gupta, J.B. (Ramjas Coll., Delhi (India)). Department of Atomic Energy, Bombay (India). Board of Research in Nuclear Physics. 1991. 310p. (CONF-9012123–: DAE symposium on nuclear physics, Madras (India), 1-4 Dec 1990). Source: OSTI; NTIS (US Sales Only); INIS.

The version-I of the Dynamic deformation theory (DDT-1) of Kumar-Baranger (1968) for the collective nuclear structure of atomic nuclei combines the Pairing-Plus-Quadrupole (PPQ) approxmation of nuclear force, the time-dependent Hartree-Bogoliubov (TDHB) method and the deformed quasi-particle (DQP) basis. A configuration space of two complete oscillator shells each for protons and neutrons, and the active nucleon space of (Z-40), (N-70) is employed in the deformed shell model approach. The later version DDT-2 employs all harmonic oscillator shells and treats all nucleons as active. The method is based on the Bohr-Mottelson unified collective model, but the restriction to axial symmetry and the adiabatic treatment of uncoupled rotation-vibration degrees of freedom is not employed. Instead, complete freedom in β-γ space for each nuclear state is allowed. The 7 parameters of the collective Hamiltonian are derived microscopically along with the EM operators. The calculation for one nucleus is completed in a few hours on a fast computer (> 10 MHz). The fitting parameters for H_c are restricted to two, one of which varies through 10% and the other within a factor of 2. The DDT-1 also called DPPQ proved very successful in predicting the spherical to deformed shape phase transition, prolate to oblate shape transition and the superfluid to normal phase transition, as illustrated by KB for the W -Os -Pt region. In the last two decades, Kumar and Gupta have demonstrated extensively the usefulness of DDT-1 for the Nd-Sm-Gd-Dy nuclei for predicting shape phase transitions, static and transition moments and interband transitions upto 10 collective bands in a individual nucleus where ample experimental data are available. (author). 35 refs., 2 figs., 1 table.

20180 (INIS-mf–13192, pp. 93-96) **Spin-spin effects and static nuclear deformation.** Hnizdo, V. (University of the Witwatersrand, Johannesburg (South Africa). Dept. of Physics). Jednota Ceskoslovenskych Matematiku a Fyziku, Prague (Czechoslovakia). 1991. 319p. (CONF-9008243–: 10. conference of Czechoslovak physicists, Brno (Czechoslovakia), 27-31 Aug 1990). Effective spin-spin interactions of both the spherical and the tensor kinds, are generated by the quadrupole nuclear reorientation together with the spin-orbit force in the elastic scattering of nucleons from nuclei with static deformation. These effects can contribute significantly to the observed spin-spin cross sections when nuclei with large static deformation are involved. On the other hand, calculations of spin-spin effects produced by quadrupole-quadrupole interactions in the scattering of deformed heavy ions indicate that these effects are not important even when large nuclear deformations are involved. (author). 2 figs., 5 refs.

In *Hadron structure '89: Proceedings of the conference.* Order Number DE92628522. Source: OSTI; NTIS (US Sales Only); INIS.

The reactions $np \to pp\pi^-$ and $dp \to ppp\pi^-$ at 1.7 GeV/c/nucleon were compared with the following results: In spite of the general qualitative agreement in reaction products characteristics, differences were observed in momentum spectra tails and in spiral azimuthal angular distributions. The first effect is due to Fermi motion, but the second could only be explained by insufficiency of the usual spectator separation as the slowest nucleon in DRF. Considering the limiting angle of emitted nucleons in the investigated reactions, another spectator definition is introduced using an additional condition posed on the angle of emission. The obtained spectator momentum distribution is well described by deuteron wave functions and only about 1% of events remains for the part of exotic effects. (author) 4 figs., 8 refs.

20183 (INIS-mf–13194, pp. 283-290) **A measurement of the deuteron structure functions from deep inelastic muon scattering at high Q^2.** Nemecek, S. Matematicko-Fyzikalna Fakulta; Jednota Slovenskych Matematikov a Fyzikov, Bratislava (Czechoslovakia). 1989. 395p. (CONF-8909475–: Hadron Structure '89, Smolenice (Czechoslovakia), 25-28 Sep 1989). In *Hadron structure '89: Proceedings of the conference.* Order Number DE92628522. Source: OSTI; NTIS (US Sales Only); INIS.

Preliminary results are presented of a high statistics study of the deuteron structure functions $F_2(x,Q2)$ and R, measured in deep inelastic muon scattering. The analysis is based on 800 000 events after all cuts, recorded at beam energies of 120, 200 and 280 GeV in the kinematic range $0.06<x<0.8$ and 8 $GeV^2<Q^2<280$ GeV^2. Scaling violations observed in the structure function F_2 are in good agreement with predictions of perturbative QCD. The QCD mass scale parameter Λ determined from these data is in good agreement with the authors' previous measurements on carbon and hydrogen targets. From the data the ratio of structure functions of the neutron and the proton is obtained using previous hydrogen results. (author) 5 figs., 13 refs.

20184 (INIS-SU–308/A, pp. 55-59) **Measurements of ^{114}In, ^{123}Te, ^{125}Te, ^{133}Ba, ^{135}Ba, ^{191}Os nuclear magnetic moments.** Miftakhov, N.M. (AN SSSR, Leningrad (USSR). Inst. Yadernoj Fiziki); Rodionov, A.A.; Smirnov, Yu.P.; Fedorov, V.V. AN Litovskoj SSR, Vilnius (USSR). Inst. Fiziki; AN SSSR, Moscow (USSR). Nauchnyj Sovet po Yadernoj Spektroskopii. 1990. 168p. (In Russian). (CONF-9006411–: 8. seminar on precise measurements in nuclear spectroscopy, Uzhgorod (USSR), 12-13 Jun 1990). In *Precision problems in nuclear spectroscopy: 1990.* Order Number DE92001356. Source: OSTI; NTIS (US Sales Only); INIS.

The work is aimed at measuring the unknown magnetic moments of ^{114}In, ^{123}Te, ^{125}Te, ^{133}Ba, ^{135}Ba, ^{191}Os nuclear states and refinement of the earlier obtained data; at determining the possible systematic errors and means of their elimination. To measure the shifts a crystal-diffraction spectrometer by Koshua allowing one to provide for several meV measurement accuracy, is used. Hyperfine shift measurement results and nuclear level magnetic moment values are presented. 14 refs.; 1 tab.

20185 (INIS-SU–308/A, pp. 60-64) **Two-stage excitation of nuclei in positron annihilation with atomic electrons.** Fedotkin, S.N. (AN Ukrainskoj SSR, Kiev (Ukraine). Inst. Yadernykh Issledovanij). AN Litovskoj SSR, Vilnius (USSR). Inst. Fiziki; AN SSSR, Moscow (USSR). Nauchnyj Sovet po Yadernoj Spektroskopii. 1990. 168p. (In Russian). (CONF-9006411–: 8. seminar on precise measurements in nuclear spectroscopy, Uzhgorod (USSR), 12-13 Jun 1990). In *Precision problems in nuclear spectroscopy: 1990.* Order Number DE92001356. Source: OSTI; NTIS (US Sales Only); INIS.

Two-stage nucleus excitation under positron annihilation by atomic electrons is considered. The cross section in the resonance for ^{115}In equals to $\sigma_R \simeq 10^{-28}$ cm^2 and the effective cross section $\sigma_{ef} \simeq 10^{-32}$ cm^2. The values obtained for σ_{ef} should be considered as evaluations of the nucleus two-stage excitation effect value under positron annihilation, which can be specified in a more realistic calculation. 9 refs.; 1 fig.

20186 (INS–913) **Exotic few-body systems involving unstable particles.** Yamazaki, Toshimitsu. Tokyo Univ., Tanashi (Japan). Inst. for Nuclear Study. Jan 1992. 14p. Order Number DE92514986. Source: OSTI; NTIS (US Sales Only); INIS.

A new light is shed on anomalously long-lived (narrow-width) few-body systems which involve unstable hadrons such as hyperons, mesons and antiprotons. Σ bound states in few-nucleon systems, deeply-bound pionic atoms and metastable hadronic helium atoms are discussed. (author).

20187 (INS–914) **Lifetime measurement of $_{\Lambda}{}^{4}$H hypernucleus.** Outa, H.; Aoki, M.; Hayano, R.S.; Ishikawa, T.; Iwasaki, M.; Sakaguchi, A.; Takada, E.; Tamura, H.; Yamazaki, T. Tokyo Univ., Tanashi (Japan). Inst. for Nuclear Study. Feb 1992. 7p. Order Number DE92515032. Source: OSTI; NTIS (US Sales Only); INIS.

Results are reported on a lifetime measurement of $_{\Lambda}{}^{4}$H formed in ^{4}He (stopped K^-, π^0) reaction. Decay of $_{\Lambda}{}^{4}$H was clearly identified by observing the monochromatic π^0 peak from two-body decay ($_{\Lambda}{}^{4}\mathrm{H} \rightarrow {}^{4}\mathrm{He} + \pi^-$ $p_\pi = 132.9$ MeV/c). The lifetime of $_{\Lambda}{}^{4}$H was determined to be $\tau(_{\Lambda}{}^{4}\mathrm{H}) = 194_{-26}{}^{+24}$ ps from a distribution of time difference between the K^- injection and π^- emission. (author)

20188 (ITP–89-62) **Effective Hamiltonian within the microscopic unitary nuclear model: 1. Coherent-state construction technique for microscopic Hamiltonian.** Filippov, G.F.; Blokhin, A.L. AN Ukrainskoj SSR, Kiev (Ukraine). Inst. Teoreticheskoj Fiziki. 1989. 25p. Order Number DE92627350. Source: OSTI; NTIS (US Sales Only); INIS.

A technique of projecting the microscopic nuclear Hamiltonian on the SU(3)-group enveloping algebra is developed. The approach proposed is based on the effective Hamiltonian restored from the matrix elements between the coherent states of the SU(3) irreducible representations. The technique is displayed for almost magic nuclei within the mixed representation basis, and for arbitrary nuclei within the single representation. 40 refs.

20189 (ITP–89-63) **Effective hamiltonian within the microscopic unitary nuclear model: 2. The study of sd-nuclei with two valence particles.** Avramenko, V.I.; Blokhin, A.L. AN Ukrainskoj SSR, Kiev (Ukraine). Inst. Teoreticheskoj Fiziki. 1989. 21p. Order Number DE92627351. Source: OSTI; NTIS (US Sales Only); INIS.

Within the microscopic version of the unitary collective model with the horizontal mixing the effective Hamiltonian for ^{18}O and ^{18}Ne nuclei is constructed. The algebraic structure of the Hamiltonian is compared to the familiar phenomenological ones with the SU(3)-mixing terms which describe the coupled rotational and vibrational spectra. The Hamiltonian, including central nuclear and Coulomb interaction, is diagonalized on the basis of three SU(3) irreducible representations with two orbital symmetries. 32 refs.; 2 figs.; 4 tabs.

20190 (ITP–89-79) **A generating function for the effective Hamiltonians in an extended unitary model.** Avramenko, V.I. AN Ukrainskoj SSR, Kiev (Ukraine). Inst. Teoreticheskoj Fiziki. 1989. 24p. Order Number DE92627352. Source: OSTI; NTIS (US Sales Only); INIS.

A generating function of the effective Hamiltonians for the nuclei whose dynamic symmetry group is a direct product SU(3)xSU(3) is constructed. It is shown that the generating function is made up of the operators of the enveloping algebra of group SU(3)xSU(3). The basis of the operators involves both the operators which change the indices of irreducible representations (λ,μ) and those which leave them unchanged. The problem of rotational and vibrational limits to the effective Hamiltonians is studied. 32 refs.

20191 (ITP–90-51) **The boundary condition model for three-particle system and nonzero partial waves.** Grinyuk, B.E.; Simenog, I.V. AN Ukrainskoj SSR, Kiev (Ukraine). Inst. Teoreticheskoj Fiziki. 1990. 20p. Order Number DE92627353. Source: OSTI; NTIS (US Sales Only); INIS.

The three-particle bound state problem in the 'boundary condition model' case is solved in the framework of Faddeev integral equations. An interaction in nonzero partial waves is shown to be necessarily taken into account due to its essential role in the model. 8 refs.

20192 (LA-UR–92-742) **The trinucleons: Physical observables and model properties.** Gibson, B.F. Los Alamos National Lab., NM (United States). [1992]. 17p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-920126–2: 13. international conference on few body problems in physics, Adelaide (Australia), 5-11 Jan 1992). Order Number DE92011354. Source: OSTI; NTIS; GPO Dep.

Our progress in understanding the properties of ^{3}H and ^{3}He in terms of a nonrelativistic Hamiltonian picture employing realistic nuclear forces is reviewed. Trinucleon model properties are summarized for a number of contemporary force models, and predictions for physical observables are presented. Disagreement between theoretical model results and experimental results are highlighted.

20193 (LA-UR–92-980) **Nuclear structure calculations for astrophysical applications.** Moeller, P. (Mainz Univ. (Germany). Inst. fuer Kernchemie); Kratz, K.L.; Nix, J.R. Los Alamos National Lab., NM (United States). 13 Mar 1992. 18p. Sponsored by USDOE, Washington, DC (United States); Bundesministerium fuer Forschung und Technologie, Bonn (Germany); Deutsche Forschungsgemeinschaft, Bonn (Germany). DOE Contract W-7405-ENG-36. (CONF-9110360–1: Exotic nuclei, South Crimea (USSR), 1-5 Oct 1991). Order Number DE92011495. Source: OSTI; NTIS; INIS; GPO Dep.

Here we present calculated results on such diverse properties as nuclear energy levels, ground-state masses and shapes, β-decay properties and fission-barrier heights. Our approach to these calculations is to use a unified theoretical framework within which the above properties can all be studied. The results are obtained in the macroscopic-microscopic approach in which a microscopic nuclear-structure single-particle model with extensions is combined with a macroscopic model, such as the liquid drop model. In this model the total potential energy of the nucleus may be calculated as a function of shape. The maxima and minima in this function correspond to such features as the ground state, fission saddle points and shape-isomeric states. Various transition rate matrix elements are determined from wave-functions calculated in the single-particle model with pairing and other relevant residual interactions taken into account.

20194 (LBL–31382) **Example of a quantum field theory based on a nonlinear Lie algebra.** Schoutens, K. (State Univ. of New York, Stony Brook, NY (United States). Inst. for Theoretical Physics); Sevrin, A.; van Nieuwenhuizen, P. Lawrence Berkeley Lab., CA (United States). Nov 1991. 42p. Sponsored by USDOE, Washington, DC (United States); National Science Foundation, Washington, DC (United States). DOE Contract AC03-76SF00098. Grant 91-08054;Grant PHY90-21139. (CONF-9105239–2: Conference on gauge theories: past and future, Ann Arbor, MI (United States), 16-18 May 1991; ITP-SB–91-34; UCB-PTH–91/52). Order Number DE92010475. Source: OSTI; NTIS; INIS; GPO Dep.

In this contribution to Tini Veltman's Festschrift we shall give a paedagogical account of our work on a new class of gauge theories called W gravities. They contain higher spin gauge fields, but the usual no-go theorems for interacting field theories with spins exceeding two do not apply since these theories are in two dimensions. It is, of course, well known that ghost-free interacting massless spin 2 fields ('the metric') are gauge fields, and correspond to the geometrical notion of general coordinate transformations in general relativity, but it is yet unknown what extension of these ideas is introduced by the presence of massless higher spin gauge fields. A parallel with supergravity may be drawn: there the presence of massless spin 3/2 fields (gravitinos) corresponds to local fermi-bose symmetries of which these gravitinos are the gauge fields. Their geometrical meaning becomes only clear if one introduces superspace (with bosonic and fermionic coordinates): they correspond to local transformations of the fermionic coordinates. For W gravity one might speculate on a kind of W-superspace with extra bosonic coordinates.

20195 (NEANDC(E)–246/L) **The Bruyeres-le-Chatel discrete level library.** Bersillon, O. (CEA Centre d'Etudes de Bruyeres-le-Chatel, 92 - Montrouge (France). Service de Physique Neutronique et Nucleaire); Blachot, J. CEA Centre d'Etudes de Bruyeres-le-Chatel, 92 - Montrouge (France). Service de Physique Neutronique et Nucleaire. Sep 1991. 26p. Sponsored by CEA, 75 - Paris (France). (INDC(FR)–071/L). Order Number DE92011702. Source: OSTI; NTIS (US Sales Only).

In order to make input data preparation for nuclear reaction model codes less time consuming we have developed at Bruyeres-le-Chatel a system of codes and format which handles discrete levels information (such as excitation energy, spin, parity, gamma decay···). The basic data are taken from the adopted levels, gamma data sets of the ENSDF library. These data are converted by a two step process into data directly usable by model codes. The two programs and the associated data format are fully described in this report.

20196 (OUP–91-29) **On the role of third- and higher-order contributions to the effective interaction for pf-shell nuclei.** Hjort-Jensen, M.; Engeland, T.; Holt, A.; Osnes, E. Oslo Univ. (Norway). Fysisk Inst. Nov 1991. 31p. Order Number DE92628578. Source: OSTI; NTIS (US Sales Only); INIS.

In this work the authors have studied the inclusion of third- and higher-order contributions in perturbation theory to the effective interaction appropriate for the pf-shell. It is concluded that these contributions are important and ought to be carefully analyzed when approximating the effective interaction to a given order. To calculate the nuclear G-≡ matrix a recent version of the Bonn meson-exchange potential model (potential A) and the Paris potential has been employed. The Paris potential is found to yield too little attraction, a result which agrees with findings in the sd-shell. The Bonn A potential reproduces fairly well the data for most JT channels in the mass-42 system. For JT = 10 in the same mass system, however, too much attraction is introduced and the agreement with the data is poor. The implications are discussed. 39 refs., 8 figs., 9 tabs.

20197 (CONF-920113–2) **Dissipation and the population of compound nuclei.** Thoennessen, M. (Michigan State Univ., East Lansing, MI (United States)); Beene, J.R. Oak Ridge National Lab., TN (United States). [1992]. 7p. Sponsored by USDOE, Washington, DC (United States); National Science Foundation, Washington, DC (United States). DOE Contract AC05-84OR21400. Grant PHY-89-13815. From 8. winter workshop on nuclear dynamics; Jackson Hole, WY (United States); 18-25 Jan 1992. Order Number DE92011681. Source: OSTI; NTIS; INIS; GPO Dep.

The importance of nuclear dissipative efforts on the formation of compound nuclei is studied with the γ-ray decay of the giant dipole resonance (GDR) built on highly excited states. The compound nuclei ^{164}Yb, ^{160}Er, and ^{110}Sn were produced with very mass-asymmetric and with more mass-symmetric target/projectile combinations. The large deviation from statistical model prediction observed in the γ-ray spectra from the more symmetrically formed ^{160}Er and ^{164}Yb can be qualitatively explained within the particle exchange model.

20198 (CONF-920113–3) **The mechanism for the disassembly of excited ^{16}O projectiles into four alpha particles.** Charity, R.J. (Washington Univ., St. Louis, MO (United States). Dept. of Chemistry); Barreto, J.L.; Sobotka, L.G.; Sarantites, D.G.; Stracener, D.W.; Chbihi, A.; Nicolis, N.G.; Auble, R.; Baktash, C.; Beene, J.R.; Bertrand, F.; Halbert, M.; Hensley, D.C.;.Oak Ridge National Lab., TN (United States). [1992]. 6p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400 ;FG02-87ER40316 ;FG02-88ER40406. From 8. winter workshop on nuclear dynamics; Jackson Hole, WY (United States); 18-25 Jan 1992. Order Number DE92011668. Source: OSTI; NTIS; INIS; GPO Dep.

The decay of excited ^{16}O projectiles into the four alpha particle exit channel has been investigated. The projectiles, with bombarding energies of E/A = 35 MeV, were excited through peripheral interactions with ^{159}Tb target nuclei. The distribution of relative angles between the four alpha particles in their center of mass frame was compared to simulations of ^{16}O decay by various mechanisms. The relative angles are found to be consistent with either a disassembly via sequential evaporation of alpha particles or by a prompt disintegration process. The data are not consistent with a sequential decay sequence initiated by the fission of the projectile into two ^{8}Be fragments.

20199 (GSI–92-04) **Study of the chemical behaviour of the element 105 and the decay properties of its isotopes $_{105}{}^{262}$Ha and $_{105}{}^{263}$Ha.** Zimmermann, H.P. Gesellschaft fuer Schwerionenforschung mbH, Darmstadt (Germany); Mainz Univ. (Germany). Fachbereich 19 - Chemie und Pharmazie. Feb 1992. 134p. (In German). Order Number DE92517028. Source: OSTI; NTIS (US Sales Only); INIS.

Main topic of the present thesis was the study of the halogenocomplexes of the element 105 in aqueous solution. Single atoms of the isotope ⁻2⁻6⁻2_1_0_5Ha were synthesized in the reaction ⁻2⁻4⁻9Bk (⁻1⁻80,5n) at 99 MeV projectile energy and detected via their spontaneous-fission as well as the α decay of the daughter ⁻2⁻5⁻8Lr. At the whole about five thousand anion and cation exchange separations were performed, whereby in the mean nearly in each twentieth experiment an atom of the ⁻2⁻6⁻2Ha could be detected. In subsequent elutions with 0.5 M HCL/0.01 M HF, with 4 M HCL/0.02 M HF, or with 10 M HCL/0.025 M HF^{262} Ha was detected in the protactinium fraction, in the niobium-protactinium fraction, respectively between the elution positions of the protactinium and the niobium and showed by this each a from tantalum extremely different behaviour. We conclude by this on the formation of oxalohalogeno or hydroxohalogenocomplexes analogous to [NbOCL_4]⁻-, [PaOCL_4]⁻, or [Pa(OH)_2CL_4]⁻-contrarily to the pure halogenocomplexes to tantalum as [TaCl$_6$]. Relativistic MO calculations confirm the strong tendency of the element 105 to the formation of oxohalogenocomplexes. At the for the ⁻2⁻4⁻9Bk (⁻1⁻80,4n) reaction optimal projectile energy of 93 MeV^{263}Ha was doubtlessly detected. It decays with 27⁻+⁻1⁻0_-_7s half-life by α decay (E_α=8.355 MeV, I_α=43%) and by spontaneous fission (I_S_F=57_-_1_5⁻+⁻1⁻3%) with a total kinetic energy of 207 MeV. The in 525 experiments detected 25 atoms of ⁻2⁻6⁻3Ha define a formation cross section of 10 mb. Also for ⁻2⁻6⁻2Ha improved decay data and cross sections are given. (orig./HSI).

20200 (INIS-mf–13179, pp. 28-46) **Exotic nuclear decay by spontaneous heavy ion emission.** Shanmugam, G. (Presidency Coll., Madras (India). Dept. of Physics). Department of Atomic Energy, Bombay (India). Board of Research in Nuclear Physics. 1991. 310p. (CONF-9012123–: DAE symposium on nuclear physics, Madras (India), 1-4 Dec 1990). In *Proceedings of the symposium* *on nuclear physics (held at Madras during December 1-4 1990): Invited talks/seminars. Vol. 33A (1990).* Order Number DE92001359. Source: OSTI; NTIS (US Sales Only); INIS.

Nuclei with $Z>40$ are metastable with respect to spontaneous decay into two fragments with masses M_1 and M_2 and Q value given by $Q = M(A,Z)-M_1(A_1, Z_1)-M_2(A_2,Z_2)> 0$. When $A_2=4$, alpha decay and the case in which $A_1 \simeq A_2$ corresponds to cold fission are obtained. The intermediate case between these two in which $4<A_2<A_1$, corresponds to exotic decay by spontaneous heavy ion emission. Though many heavy nuclei have $Q>0$ for such decays, the decay rates are undetectably low except for certain combinations correspoding to fragments with nearly closed shells. To choose favourable cases for experimental study, a quantitative model to determine decay rates is required. In developing such a model one has to consider the process to be a very asymmetric fission or a preformation followed by tunneling mechanism. A fission model which contains realistic features has been developed. The merits and limitations of this model are discussed in relation to other theoretical models and experimental results. Future prospects of such a study are dealt with at the end. (author). 24 refs., 3 tabs.

20201 (INIS-mf–13179, pp. 154-174) **Neutrinoless $\beta\beta$-decay using a quark model with relativistic harmonic confinement.** Khadkikar, S.B. (Physical Research Lab., Ahmedabad (India)). The nuclear double beta decay without neutrino emission would provide evidence for lepton-non-conservation and the Majorana nature of neutrinos or the right handed nature of the weak current or the see-saw mechanism for generating neutrino mass in conjuction with Grand Unification Theoretical (GUT) scenario. The impediments in the large number of investigations in the past decade has been the closure approximation to the nuclear part of the amplitude and uncertainty about recoil effects in addition to the effective coupling constants due to non-elementerity of the nucleon. To avoid these pitfalls, a relativistic quark confinement model is employed to obtain form factors due to hadronic currents in double beta decay. The nuclear part of the form factor is evaluated in quasi-particle neutron-proton random phase approximation. The double beta decay amplitude formula is developed so as to avoid closure approximation. Effective vector and axial vector coupling constants in the hadronic current are not used. The recoil matrix elements arise naturally from quark recoil in decaying neutrons. The formalism is applied to the neutrinoless double beta decay of ^{76}Ge to the ground state of ^{76}Se without and with inclusion of p-wave in addition to the dominant s-wave nuclear matrix elements in the decay amplitude. From the experimental lower bound for the decay half-life an upper limit for the effective Majorana mass of the neutrino is deduced and the right banded contribution to the charged week current estimated. (author). 18 refs., 1 appen dix., 6 tabs.

Nauchnyj Sovet po Yadernoj Spektroskopii. 1990. 168p. (In Russian). (CONF-9006411–: 8. seminar on precise measurements in nuclear spectroscopy, Uzhgorod (USSR), 12-13 Jun 1990). In *Precision problems in nuclear spectroscopy: 1990.* Order Number DE92001356. Source: OSTI; NTIS (US Sales Only); INIS.

Light effect on the rate of radioactive transformation of ^{65}Zn nucleus is investigated. The investigations are conducted by γ spectrometry $\Delta I_\gamma/I_\gamma$ method where I_γ intensity change in a certain γ spectrum line resulting from a change of transition probability is measured. The basic transitions in the ^{65}Zn decay flowsheet are demonstrated. A difference of amplitude pulse distribution of illuminated and obscure ^{65}Zn+^{137}Cs sources is presented. The experiments show that the accuracy of $\Delta I_\gamma/I_\gamma$ determination in the experiment is no worse than 10^{-5} and that under sample illumination the probability of electron capture by ^{65}Zn nuclei is reduced. 10 refs.; 5 figs.; 1 tab.

20204 (INIS-SU–308/A, pp. 15-20) **Effect of conversion lines hyperfine shift in ^{181}Ta.** Lashko, A.P. (AN Ukrainskoj SSR, Kiev (Ukraine). Inst. Yadernykh Issledovanij); Feoktistov, A.I. AN Litovskoj SSR, Vilnius (USSR). Inst. Fiziki; AN SSSR, Moscow (USSR). Nauchnyj Sovet po Yadernoj Spektroskopii. 1990. 168p. (In Russian). (CONF-9006411–: 8. seminar on precise measurements in nuclear spectroscopy, Uzhgorod (USSR), 12-13 Jun 1990). In *Precision problems in nuclear spectroscopy: 1990.* Order Number DE92001356. Source: OSTI; NTIS (US Sales Only); INIS.

Transitions in ^{181}Ta are investigated. ^{181}Hf sources are produced in (n, γ) reaction under irradiation on a reactor target of ^{180}HfF$_4$ enriched up to 96.2%. Characteristics of transitions in ^{181}Ta and the calculated expected conversion K-, L_1- and L_2-line shifts are presented. The value and sign of relative shifts of conversion lines for K137-K133 and K137-K136 doublets agree qualitatively with theoretic calculations. It is not possible to measure L-line difference due to an insufficient source specific activity. 9 refs.; 1 fig.; 2 tabs.

(CONF-901057–31: 7. international symposium on capture gamma-ray spectroscopy and related topics, Pacific Grove, CA (United States), 14-19 Oct 1990). Order Number DE92011396. Source: OSTI; NTIS; GPO Dep.

Considerable amounts of tedious labor are required to manually scan high-resolution 1D slices of two dimensional γ-γ coincident matrices for relevant and exciting structures. This is particularly true when the interesting structures are of weak intensity. We are working on automated search methods for the detection of rotational band structures in the full 2D space using pattern recognition techniques. For nominal sized data sets (1024×1024), however, these techniques only become computationally feasible through the use of Fourier Transform methods. Furthermore the presentation of data matrices as images rather than series of 1D spectra has been shown to be useful. In this paper we will present the data manipulation techniques we have developed.

20206 (GSI–91-64(prepr.)) **Fluctuations in nuclear dynamics: Comparison of different methods.** Chapelle, F. (Lawrence Berkeley Lab., CA (United States). Nuclear Science Div.); Burgio, G.F.; Chomaz, P.; Randrup, J. Gesellschaft fuer Schwerionenforschung mbH, Darmstadt (Germany). Dec 1991. 51p. Contract DE-AC03-76SF00098. Order Number DE92516494. Source: OSTI; NTIS (US Sales Only); INIS.

We compare several methods for incorporating the effect of the fluctuating collision integral in Boltzmann-Uehling-Uhlenbeck simulations of nuclear dynamics: the method of correlated pseudo-particle collisions proposed by Bauer, Bertsch, and Das Gupta, the method of projection onto collective variables (specifically the local quadrupole moment of the momentum distribution) proposed by Ayik and Gregoire, and the method of direct simulation on a lattice in phase space recently proposed by Burgio, Chomaz, and Randrup. Considering a periodic two-dimensional nucleon gas in a constant one-body field, we examine the evolution of the fluctuations of the phase-space occupancy and their correlations. (orig.).

Jednota Ceskoslovenskych Matematiku a Fyziku, Prague (Czechoslovakia). 1991. 319p. (In Slovak). (CONF-9008243–: 10. conference of Czechoslovak physicists, Brno (Czechoslovakia), 27-31 Aug 1990). In *The tenth conference of Czechoslovak physicists.* Order Number DE92628439. Source: OSTI; NTIS (US Sales Only); INIS.

Achievements and problems of pre-equilibrium gamma emission in nuclear reactions are outlined. The field includes processes that, on the time scale, lie between direct reactions and compound-nucleus reactions. Several pre-equilibrium models exist to date. A common drawback is in the fact that the generally formulated models do not lend themselves to a straightforward transformation into computation schemes. Pre-equilibrium nuclear reaction theory includes a group of phenomenological models (the exciton and the hybrid models) and a group of quantum-mechanical models (which can be divided into multi-step compound models and multi-step direct models). Among problems that are being successfully addressed is the radiative mechanism in the pre-equilibrium state. Two pre-equilibrium mechanisms are now distinguished: the single-particle mechanism describing gamma spectra in the region of giant resonances (about 10 to 25 MeV), and the two-particle mechanism describing gamma spectra in the region of hard photons, which extends as far as the π meson threshold (about 140 MeV). (Z.S.). 16 refs.

Accepted for publication in Physical Review Letters.

Pre-scission charged particle multiplicities, following fusion of ^{164,167,170}Er + ^{28}Si, have been measured. The multiplicities at the lowest bombarding energies limit the statistical model level density parameters. More importantly the α-data restrict the time spend near equilibrium and suggest evaporation occurs predominantly from larger deformations. 18 refs., 6 figs.

Source: OSTI; NTIS; INIS; GPO Dep.

The properties of the fully damped (deep-inelastic and orbiting) and fusion (evaporation and fission) processes have been investigated in three entrance channels leading to the same ^{47} V compound nucleus at high excitation energies. No entrance channel effect has been observed in either the evaporation residue or the fission-like yields in contrast to the ^{28}Si + ^{12}C and ^{24}Mg + ^{16}O reactions in which the orbiting process still persists. The asymmetrical elemental distributions of the fully energy relaxed fragments are well described by fusion-fission models based respectively on the scission point and saddle point pictures. Finally a general discussion of the competition between orbiting and fusion-fission mechanisms in light heavy-ion reactions is presented in the framework of their calculated available number of open channels.

20210 (ESM–35) **Coupled-channels optical calculation of observables for electron-sodium scattering at 20 eV.** McCarthy, I.E. (Flinders Univ. of South Australia, Adelaide (Australia). Electronic Structure of Materials Centre); Nicholson, R.; Mitroy, J. Flinders Univ. of South Australia, Adelaide (Australia). Electronic Structure of Materials Centre. Aug 1991. 7p. Order Number DE92627368. Source: OSTI; NTIS (US Sales Only); INIS.

Electron-sodium scattering is calculated at 20eV by the coupled-channels optical method with 8 channels (3, 4, 5s; 3, 4, 5p; 3, 4d) explicitly coupled and the ionisation continuum represented by the half-on-shell optical potential. In comparison with experiment differential cross sections for 3s and 3p, 3p angular correlation data and asymmetry are well described. Some discrepancy remains with the 3s asymmetry. The calculation is compared with less-detailed calculations to identify the effects of different sets of channels. 11 refs., 1 tab.

Grant PHY-84-15064;PHY-89-21025. Order Number DE92516782. Source: OSTI; NTIS (US Sales Only); INIS.

The convective stability of strongly interacting matter undergoing hydrodynamic flow in ultrarelativistic heavy-ion collisions is studied in both the quark-gluon plasma and hadron gas phases. We find that this stability depends on the form of the initial conditions assumed for the hydrodynamic flow. In the case of initial conditions corresponding to partial transparency the flow of the quark-gluon plasma is stable whereas the flow of the hadron gas is convectively unstable. The timescale for hydrodynamic oscillations around the (stable or unstable) equilibrium state is found to be larger than the expected lifetime of the system, suggesting that the flow in either case is close to neutral convective equilibrium. (orig.).

We study the effect from dissipation of relative angular momentum on fluctuations of exitations functions in dissipative heavy-ion collisions. Dissipation and fluctuation of relative angular momentum modify and smooth the time-angle localization of the roating dinuclear system. The secondary maxima in the energy correlation function of the cross-section are shifted to smaller values of the energy difference, the shift depending on the relaxation time and the diffusion coefficient for the angular-momentum dissipation. The results are illustrated for the collision ^{28}Si(E_{lab}=130MeV)+^{48}Ti. (orig.).

Charged particles have been observed in collisions of Au on Au at incident energy of 150 A MeV using a high-granularity detector system covering approximatley the forward hemisphere in the center-of-mass system. Highly central collisions have been studied using a double selection criterion which combines large charged particle multiplicities with small transverse momentum directivities. In this class of events about one quarter of the total nuclear charge emerges as intermediate mass fragments with nuclear charges $Z>2$. These fragments are centred at midrapidity and are produced with large transverse velocities. (orig.).

We investigate the production of heavy quarks in continuum and bound states in nuclear collisions. Creation for free banti b and tanti t quark pairs and for bottomonium and toponium in the ground state are computed at RHIC, LHC and SSC energies. Central and peripheral heavy-ion collisions are discussed. For top quark creation we assumed a mass range of 90 GeV $\leq m_t \leq$ 250 GeV. The creation rate for top quarks on peripheral collisions is estimated to be by a factor 40 to 130 smaller compared with corresponding central collisions. For m_t = 130 GeV we calculated a creation rate of about 4760 top quark pairs per day at the LHC (3.5 TeV/u) for Pb-Pb collisions. (orig.).

The study of nucleus-nucleus collisions provides a way to learn about the nuclear equilibration process in several collective degrees of freedom of much physical significance and their characteristics relaxation times. The reactions resulting from nucleus-nucleus collisions at intermediate energies can be broadly classified in four types: elastic (and quasi elastic) reaction, dinucleus reactions involving deep inelastic collisions, non-compound nucleus fusion reactions like fast-fission, quasi-fission and pre-equilibrium fission and true compound nucleus reactions. Experimentally, it is not always possible to identify uniquely the reaction products as belonging to the pre or post compound nucleus phase. This often leads to apparent anomaly in the interpretation of some of the experimental results in heavy ion reaction studies. Measurements of various observables in fission-like reactions provides information about the reaction mechanism and dynamics. Fission fragment angular distributions, which depend on the spin distributions and the shape parameters of the fissioning nucleus, give information about the fusion dynamics. Pre and post scission neutron multiplicities in fusion-fission reactions are used to determine pre-scission life times. Fragment-fragment angular correlation acts as a probe for linear momentum transfer characterising the reaction mechanism. The experimental results on the different aspects of the heavy ion fission studies and the information obtained on the dynamical features of the heavy ion collisions are summarised. (author). 36 refs., 12 figs.

The most elementary of the charge exchange reactions are $p(^3He,t)\Delta^{++}$ and $p(p,\Delta^{++})n$. These are analyzed in detail. The $p(^3He,t)\Delta^{++}$ reaction is studied in distorted wave Born approximation considering both the direct and the exchange processes. Distorted wave functions are calculated using the eikonal approximation. A coupled channel formalism has been developed to analyze $p(p,\Delta^{++})n$ reaction. The distorted wave functions in this case also are written in eikonal approximation directly in terms of the scattering amplitudes. (author). 17 refs., 6 figs.

A brief summary is given of some recent experiments with polarized ^{6}Li, ^{7}Li and ^{23}Na sources, performed in Daresbury and Heidelberg. At the Daresbury tandem, the on-target beam intensities were about 10 pnA with polarization values about 80% and 50% of the maximum possible for lithium and sodium beams respectively. Discussed are the polarization effects in elastic scattering of aligned (tensor polarized) beams, the Tidal Symmetry model, the polarization effects in nucleon transfer reactions with heavy ions, and the fusion of polarized ^{7}Li and ^{23}Na. It can be concluded that the studies of nucleus-nucleus collisions with polarized projectiles provide important insight into details of the interaction and reveal new information on the reaction dynamics. Most of the data can be qualitatively explained using semi-classical models which are invaluable tools in understanding the basic physical processes taking place, without involving time-consuming quantum-mechanical calculations. (Z.S.). 10 refs.

In *Hadron structure '89: Proceedings of the conference.* Order Number DE92628522. Source: OSTI; NTIS (US Sales Only); INIS.

It is well known that the spectrum of protons and leptons is a meaningful signal of quark-gluon plasma formation because photons and leptons leave the plasma volume without interaction. Because of the confinement of quarks and gluons, with the hadron spectrum the situation is more complex. The present theory, unfortunately, does not allow to solve this problem using only the basic principle of the theory. This is why the hadron spectrum has to be calculated within the framework of some model. The use of the chromoelectric flux tube model is described. The radiation pressure was shown to be small and therefore the used approximation of a one-dimensional hydrodynamic expansion of plasma was legitimate. The tube formed between the quark and the plasma was supposed to be tightened in the shortest way (a minimum of energy) and with masses of u,d-quarks equal to zero. (Z.S.) 5 refs.

A shock wave picture of the deconfinement transition was studied. Central heavy ion collisions were considered using the one-dimensional shock model. Such a picture of nuclear collisions with neglected transparency can probably be justified at intermediate energies $E_{lab}/A < 10$ GeV. For the description of the quark-gluon phase, the bag model equation of state was used with massless u and d quarks and gluons. A new generalized nuclear matter equation of state was formulated which preserves all advantages of the mean-field and phenomenological approaches. Non-trivial shock wave configurations have appeared in the one-dimensional hydrodynamic model of the compression stage in heavy ion collisions. These hydrodynamic configurations can serve as a signature of the deconfinement transition. (Z.S.) 2 figs., 13 refs.

Source: OSTI; NTIS (US Sales Only); INIS.

Charged multiplicity and transverse energy distribution from $^{16}O+Au$ at 200 A GeV are dealt with. These distributions were measured by the WA80 experiment at the CERN SPS. The widths of the distributions can be divided into different contributions each of which has a physical interpretation. By use of the Monte-Carlo code Fritiof developed for ultra-relativistic heavy-ion collisions, the sizes of the various contributions are calculated. The contributions are determined both for central and minimum bias collisions. The apparent importance of the region of observation and also the additional widening due to limited resolution and efficiency of the detectors are discussed. Comparisons are made with the widths measured by WA80. (author) 7 figs., 7 refs.

20229 (INIS-mf–13194, pp. 214-218) **Transverse momentum distribution of lepton pairs in hadron-nuclear collisions.** Buzaladze, M.E. (AN Gruzinskoj SSR, Tbilisi (USSR). Tbilisskij Matematicheskij Inst.); Garsevanishvili, V.R.; Hanna, K.M.; Matveev, V.A.; Menteshashvili, Z.R. Slovenska Akademia Vied, Bratislava (Czechoslovakia). (Czechoslovakia). 1989. 395p. (CONF-8909475–: Hadron Structure '89, Smolenice (Czechoslovakia), 25-28 Sep 1989). In *Hadron structure '89: Proceedings of the conference.* Order Number DE92628522. Source: OSTI; NTIS (US Sales Only); INIS.

Recent experimental data on the transverse momentum distributions of lepton pairs produced in pion-nucleus interactions revealed a strong nuclear dependence of these distributions. A comparison of the cross sections of lepton pair production in π^-W and π^-D interactions shows that the cross section ratio increases with increasing transverse momentum of the pairs. An attempt is described undertaken to explain the effect of increasing the lepton pair production cross section ratio with a rise in transverse momentum in the framework of the multiquark bag model, taking into account the transverse motion of quarks inside bags. (Z.S.) 1 fig., 8 refs.

20230 (INIS-mf–13194, pp. 203-213) **Hadron gas production in heavy ions collisions.** Ryskin, M.G. (AN SSSR, Leningrad (USSR). Inst. Yademoj Fiziki). Slovenska Akademia Vied, Bratislava (Czechoslovakia). Fyzikalny Ustav; Komenskeho Univ., Bratislava (Czechoslovakia). Matematicko-Fyzikalna Fakulta; Jednota Slovenskych Matematikov a Fyzikov, Bratislava (Czechoslovakia). 1989. 395p. (CONF-8909475–: Hadron Structure '89, Smolenice (Czechoslovakia), 25-28 Sep 1989). In *Hadron structure '89: Proceedings of the conference.* Order Number DE92628522. Source: OSTI; NTIS (US Sales Only); INIS.

The role is discussed of final state interactions between secondary hadrons in heavy ion collisions. The $^{16}O+Au$ interaction was considered at an initial energy of 200 GeV/nucleon. Estimated were the secondary pions density, the mean number of rescattering ν_π, the size of the interaction volume, and the effective temperature of the hadron gas depending on the size of the pion gas cloud. The estimates are in agreement with the current experimental data. (Z.S.) 19 refs.

20231 (INIS-mf–13194, pp. 219-225) **Strong corrections to thermal dilepton production from a quark-gluon plasma.** Boehm, G. (Regensburg Univ. (Germany)). Slovenska Akademia Vied, Bratislava (Czechoslovakia). Fyzikalny Ustav; Komenskeho Univ., Bratislava (Czechoslovakia). Matematicko-Fyzikalna Fakulta; Jednota Slovenskych Matematikov a Fyzikov, Bratislava (Czechoslovakia). 1989. 395p. (CONF-8909475–: Hadron Structure '89, Smolenice (Czechoslovakia), 25-28 Sep 1989). In *Hadron structure '89: Proceedings of the conference.* Order Number DE92628522. Source: OSTI; NTIS (US Sales Only); INIS.

A perturbative calculation is outlined of the thermal dilepton production rate from a quark-gluon plasma of the order of $\alpha\alpha_s$. After an introduction motivating this computation, a new "old-fashioned" method is demonstrated of implementing perturbative QCD at non-zero temperature and density. (author) 2 figs., 7 refs.

20232 (INIS-mf–13194, pp. 226-234) **Dilepton emission from non-perturbative quark-gluon plasma.** Gorenstein, M.I. (AN Ukrainskoj SSR, Kiev (Ukraine). Inst. Teoreticheskoj Fiziki); Mogilevsky, O.A. Slovenska Akademia Vied, Bratislava (Czechoslovakia). Fyzikalny Ustav; Komenskeho Univ., Bratislava (Czechoslovakia). Matematicko-Fyzikalna Fakulta; Jednota Slovenskych Matematikov a Fyzikov, Bratislava (Czechoslovakia). 1989. 395p. (CONF-8909475–: Hadron Structure '89, Smolenice (Czechoslovakia), 25-28 Sep 1989). In *Hadron structure '89: Proceedings of the conference.* Order Number DE92628522. Source: OSTI; NTIS (US Sales Only); INIS.

The analysis of thermodynamic data in lattice QCD using Monte Carlo calculations shows the presence of considerable non-perturbative effects also for $\epsilon\simeq\epsilon_0$ (ϵ is the energy density). These effects can be reproduced in a model with low momentum cut-off in the distribution functions of color quarks and gluons. In the quark-antiquark $\rightarrow 1^+1^-$ processes the cut-off, in effect, does not affect the thermal dilepton spectrum for large invariant mass ($M \simeq 2$ GeV). The low momentum cut-off changes dramatically the dilepton spectrum behavior for low invariant mass ($M < 2m_\pi$). The threshold effect on P_{transv} shows for low mass dilepton emission through quark-antiquark annihilation processes in non-perturbative QG plasma and it may lead to the peculiar structure of the dilepton spectrum within the transverse momentum region P_{transv} = (1-2) GeV. (Z.S.) 1 fig., 15 refs.

20233 (INIS-mf–13194, pp. 235-241) **Kinetic equations for the quark-gluon plasma and their semiclassical expansion.** Weigert, H. (Regensburg Univ. (Germany)). Slovenska Akademia Vied, Bratislava (Czechoslovakia). Fyzikalny Ustav; Komenskeho Univ., Bratislava (Czechoslovakia). Matematicko-Fyzikalna Fakulta; Jednota Slovenskych Matematikov a Fyzikov, Bratislava (Czechoslovakia). 1989. 395p. (CONF-8909475–: Hadron Structure '89, Smolenice (Czechoslovakia), 25-28 Sep 1989). In *Hadron structure '89: Proceedings of the conference.* Order Number DE92628522. Source: OSTI; NTIS (US Sales Only); INIS.

Extension of classical non-equilibrium, i.e. kinetic theories, into the domain of the gauge field theory requires the formulation of Wigner operators, physical space itself and kinetic equations determining non-equilibrium processes. A contribution is given to the reformulation of Wigner operators and their quantum kinetic equations with emphasis on the idea of physical phase space. (Z.S.) 2 figs., 11 refs.

20234 (INIS-mf–13194, pp. 296-302) **The concept of J/ψ formation time and the p_T-dependence of J/ψ suppression.** Lietava, R. (Slovenska Akademia Vied, Bratislava (Czechoslovakia). Fyzikalny Ustav); Nogova, A.; Horvath, I.; Pisut, J. Slovenska Akademia Vied, Bratislava (Czechoslovakia). Fyzikalny Ustav; Komenskeho Univ., Bratislava (Czechoslovakia). Matematicko-Fyzikalna Fakulta; Jednota Slovenskych Matematikov a Fyzikov, Bratislava (Czechoslovakia). 1989. 395p. (CONF-8909475–: Hadron Structure '89, Smolenice (Czechoslovakia), 25-28 Sep 1989). In *Hadron structure '89: Proceedings of the conference.* Order Number DE92628522. Source: OSTI; NTIS (US Sales Only); INIS.

A short description is given of the method used for obtaining the quantum mechanical description of the time development of the quark-antiquark system immersed into the deconfining medium. The existence of such a medium (QGP or gas of quarks and gluons with large density) was the basic assumption for the method used. The question of the p_T-dependence of J/ψ suppression was also discussed. The results of the study can be summarized as follows: The quantum mechanical dissolution time $t_{1/2}\simeq0.2$ fm/c is smaller than the semiclassical estimate $\tau\simeq1$ fm/c; as a consequence, QGP dissolution cannot explain the observed p_T-dependence of J/ψ suppression; in the quantum mechanical approach to J/ψ dissolution a more detailed understanding is lacking of the formation of the quark-antiquark wave packet and of the sensitivity of J/ψ dissolution to the shape of the quark-antiquark wave function at $t=0$. (Z.S.) 2 figs., 10 refs.

20235 (INIS-mf–13194, pp. 355-360) **Transverse momentum dependent angular distributions with applications to hadron-nucleus collisions.** Blazek, M. (Slovenska Akademia Vied, Bratislava (Czechoslovakia). Fyzikalny Ustav). Slovenska Akademia Vied, Bratislava (Czechoslovakia). Fyzikalny Ustav; Komenskeho Univ., Bratislava (Czechoslovakia). Matematicko-Fyzikalna Fakulta; Jednota Slovenskych Matematikov a Fyzikov, Bratislava (Czechoslovakia). 1989. 395p. (CONF-8909475–: Hadron Structure '89, Smolenice (Czechoslovakia), 25-28 Sep 1989). In *Hadron structure '89: Proceedings of the conference.* Order Number DE92628522. Source: OSTI; NTIS (US Sales Only); INIS.

The approach involving coherent state expansions allows to obtain transverse-momentum-dependent angular distributions. Their explicit form as well as the low order approximation are given in the Collins-Soper and Gottfried-Jacson frames. The approximating expression obtained in the Collins-Soper frame is applied to the collision of a negative pion beam (194 GeV/c) with tungsten nuclei. Comparison of the results with experimental data shows sufficient agreement. (author) 8 refs.

20236 (INIS-SU–312, pp. 13-34) **Polarization phenomena in deuteron photodisintegration and dibaryon resonances.** Barannik, V.P. (AN Ukrainskoj SSR, Kharkov (Ukraine). Fiziko-Tekhnicheskij Inst.); Kulish, Yu.V. Gosudarstvennyj Komitet po Ispol'zovaniyu Atomnoj Ehnergii SSSR, Moscow (USSR); Gosudarstvennyj Komitet po Ispol'zovaniyu Atomnoj Ehnergii SSSR, Moscow (USSR). Tsentral'nyj Nauchno-Issledovatel'skij Inst. Informatsii i Tekhniko-Ehkonomicheskikh Issledovanij po Atomnoj

Nauke i Tekhnike. 1989. 116p. (In Russian). In *Nuclear-physical researches (Theory and experiments): Scientific-technical collection.* Order Number DE92001360. Source: OSTI; NTIS (US Sales Only); INIS.

The problems of dibaryon resonances (DR) and computation of the amplitudes of DR photoexcitation in $\gamma d \rightarrow pn$ are discussed. Ambiquities of energy-independent multipole analyses of deuteron photodisintegration are considered. It is shown that polarization effect studies are necessary for determining the amplitudes of DR photoexcitation in $\gamma d \rightarrow pn$. Forecasts of observables corresponding to two polarized particles in deuteron photodisintegration are given. 77 refs.; 10 figs.; 5 tabs.

20237 (INIS-SU-312, pp. 88-93) **Review on the theoretical and experimental situation relative to the reactions $\gamma N \rightarrow \pi\Delta$ and $eN \rightarrow e\pi\Delta$.** Zayats, A.A. (AN Ukrainskoj SSR, Kharkov (Ukraine). Fiziko-Tekhnicheskij Inst.). Gosudarstvennyj Komitet po Ispol'zovaniyu Atomnoj Ehnergii SSSR, Moscow (USSR); Gosudarstvennyj Komitet po Ispol'zovaniyu Atomnoj Ehnergii SSSR, Moscow (USSR). Tsentral'nyj Nauchno-Issledovatel'skij Inst. Informatsii i Tekhniko-Ehkonomicheskikh Issledovanij po Atomnoj Nauke i Tekhnike. 1989. 116p. (In Russian). In *Nuclear-physical researches (Theory and experiments): Scientific-technical collection.* Order Number DE92001360. Source: OSTI; NTIS (US Sales Only); INIS.

The calculation of observables in $\gamma N \rightarrow \pi\Delta$ reaction is performed in terms of the model which accounts for the contributions of single-pion gradient-invariant mechanism and a series of resonances. The theoretical and experimental situation associated with $\gamma N \rightarrow \pi\Delta$ and $eN \rightarrow e\pi\Delta$ reactions is reviewed. 24 refs.; 9 figs.

20238 (INIS-SU-312, pp. 69-84) **Electron scattering on deuterons.** Rekalo, M.P. (AN Ukrainskoj SSR, Kharkov (Ukraine). Fiziko-Tekhnicheskij Inst.); Gakh, G.I.; Rekalo, A.P. Gosudarstvennyj Komitet po Ispol'zovaniyu Atomnoj Ehnergii SSSR, Moscow (USSR); Gosudarstvennyj Komitet po Ispol'zovaniyu Atomnoj Ehnergii SSSR, Moscow (USSR). Tsentral'nyj Nauchno-Issledovatel'skij Inst. Informatsii i Tekhniko-Ehkonomicheskikh Issledovanij po Atomnoj Nauke i Tekhnike. 1989. 116p. (In Russian). In *Nuclear-physical researches (Theory and experiments): Scientific-technical collection.* Order Number DE92001360. Source: OSTI; NTIS (US Sales Only); INIS.

The analysis of polarization effects in the reaction of deuteron electrodisintegration is carried out within the scope of relativistic impulse approximation. A possibility of determining almost unknown charged form factor of neutron and establishing spin structure of deuteron wave function is investigated. 47 refs.; 13 figs.

20239 (INIS-SU-312, pp. 94-101) **Calculation of radiative corrections to the cross section of electron scattering on nuclei with the structure function method.** Merenkov, N.P. (AN Ukrainskoj SSR, Kharkov (Ukraine). Fiziko-Tekhnicheskij Inst.). Gosudarstvennyj Komitet po Ispol'zovaniyu Atomnoj Ehnergii SSSR, Moscow (USSR); Gosudarstvennyj Komitet po Ispol'zovaniyu Atomnoj Ehnergii SSSR, Moscow (USSR). Tsentral'nyj Nauchno-Issledovatel'skij Inst. Informatsii i Tekhniko-Ehkonomicheskikh Issledovanij po Atomnoj Nauke i Tekhnike. 1989. 116p. (In Russian). In *Nuclear-physical researches (Theory and experiments): Scientific-technical collection.* Order Number DE92001360. Source: OSTI; NTIS (US Sales Only); INIS.

The cross section of deep inelastic eA scattering taking into account radiative corrections is presented in the form of convolution of electron structure functions with hard part of cross section. The hard part of cross section is calculated in the lowest orders of perturbation theory. The derived formulas ensures accuracy exceeding 1% even in the cases when corrections of the first order for α are great (about 100%). 20 refs.; 3 figs.

20240 (INIS-SU-312, pp. 85-87) **Non-Abelian anomalies in vector meson decays and in photon-pion interactions.** Koval'chuk, V.A. (AN Ukrainskoj SSR, Kharkov (Ukraine). Fiziko-Tekhnicheskij Inst.). Gosudarstvennyj Komitet po Ispol'zovaniyu Atomnoj Ehnergii SSSR, Moscow (USSR); Gosudarstvennyj Komitet po Ispol'zovaniyu Atomnoj Ehnergii SSSR, Moscow (USSR). In *Nuclear-physical researches (Theory and experiments): Scientific-technical collection.* Order Number DE92001360. Source: OSTI; NTIS (US Sales Only); INIS.

A possibility to study non-Abelian anomalies in radiation decays of vector mesons and in the reactions of photoproduction of three pions in Coulomb field of nuclei is discussed. 21 refs.; 1 tab.

20241 (ITF-90-7) **Diffraction processes with the participation of small-nucleon nuclei.** Tartakovskij, V.K.; Cherednichenko, V.A.; Evlanov, M.V.; Sokolov, A.M. AN Ukrainskoj SSR, Kiev (Ukraine). Inst. Teoreticheskoj Fiziki. 1990. 33p. (In Russian). Order Number DE92627379. Source: OSTI; NTIS (US Sales Only); INIS.

The diffraction process $^3He(p,2p)^2H$ has been investigated on the offered approximative microscopic approach basis with the making use of calculated wave functions of final and initial states for NN-potentials which had been set. Protons and deuterons scattering cross-sections on light and heavy nuclei have been counted up taking into account the coulomb interaction. The role of an interference of the abovementioned interaction with a nuclear diffraction has been showed. Elastic scattering and diffraction disintegration cross-sections of ions ^6Li on nuclei and vector and tensor polarizations of the scattered ions ^6Li and deuterons which had been formed have been calculated in the dependence of a parameter of a diffusivity of an edge of the target nucleons. 18 refs.; 12 figs.

20242 (ITP-89-36) **Correlations between Nd scattering lengths for the mirror three-nucleon systems.** Kharchenko, V.F.; Navrotskij, M.A.; Shadchin, S.A. AN Ukrainskoj SSR, Kiev (Ukraine). Inst. Teoreticheskoj Fiziki. 1989. 36p. Order Number DE92627380. Source: OSTI; NTIS (US Sales Only); INIS.

In the framework of the Faddeev-Noble integral equations for three nucleons, with the explicit separation and removal of the long-range polarization interaction between the proton and the deuteron, the direct calculation of the proton-deuteron scattering lengths in the model with the separable NN interaction is carried out. Also the quartet pd scattering length is calculated using the approximations for the NN t-matrices independent of the form of the interaction potential: the zero and the linear approximations in the triplet-spin effective range. Correlations between the Nd scattering lengths for the mirror 3N systems are studied. 35 refs.; 5 figs.; 3 tabs.

20243 (ITP-90-44) **Pion multiplicity in heavy-ion collisions: possible signature of the deconfinement transition.** Bugaev, K.A.; Gorenstejn, M.I.; Rischke, D.H. AN Ukrainskoj SSR, Kiev (Ukraine). Inst. Teoreticheskoj Fiziki. 1990. 8p. Order Number DE92627389. Source: OSTI; NTIS (US Sales Only); INIS.

Due to the existence of a mixed phase of quark and hadronic matter a specific shock wave structure arises in central heavy-ion collisions. We show that this may result in a plateau-like behaviour of the excitation function of the pion multiplicity at freeze-out, which may serve as a new qualitative signature for the deconfinement transition. 12 refs.; 2 figs.

20244 (Juel-2540) **Pion- and photoabsorption on nuclei in the Δ-resonance region.** Koerfgen, B. Forschungszentrum Juelich GmbH (Germany). Inst. fuer Kernphysik. Oct 1991. 97p. (In German). Order Number DE92511504. Source: OSTI; NTIS (US Sales Only); INIS.

In charge-exchange reactions and in π-absorptin at intermediate energies the Δ peak position in nuclei is shifted downwards in energy compared to the Δ-excitation of the nucleon. For electromagnetic probes the experimental data do not show such a shift. We describe the excitation of the Δ in nuclei consistently for all these different probes using the isobar-hole-model (ΔN^{-1}-model). The shift of the Δ peak position in charge-exchange reactions and in π-absorption is due to an attractive ΔN^{-1}-residual interaction in the spin-longitudinal (o vectorxq vector) channel. A ΔN^{-1}-residual interaction consisting of the π-exchange potential alone is too attractive in the spin-longitudinal channel and shifts the Δ peak position for π-absorption to too low energies. In order to reproduce the Δ peak position we have to include short range correlations in the ΔN^{-1}-residual interaction. This is done either by adding a δ-force, parametrized through the Landau-Migdal-parameter $g'_{\Delta\Delta}$, to the π-exchange potential, or by multiplying the π-exchange potential with a correlation-function. This leads to a repulsive ΔN^{-1}-residual interaction in the spin-transverse (o vectorxq vector) channel, which shifts the Δ peak position in the calculations for photo-absorption to higher energies compared to the photo-absorption on the nucleon. (orig.).

20245 (KFK–4873) **User manual for the KfK code PCROSS.** Ravndal, S.; Oblozinsky, P.; Kelzenberg, S.; Cierjacks, S. Kernforschungszentrum Karlsruhe GmbH (Germany). Inst. fuer Materialforschung. Aug 1991. 20p. Order Number DE92511423. Source: OSTI; NTIS (US Sales Only); INIS.

The PCROSS code calculates the so-called 'pseudo' cross sections for sequential (x,n) reactions and merges them together with 'collapsed' cross sections for neutron induced reactions into one file of cross sections. The file is tailored to provide an input for the FISPACT inventory code that calculates the activation and related radiological quantities of material irradiated in a neutron flux. The present report describes the structure of the KfK code PCROSS, outlines the role of subroutines, and provides necessary information for a practical user of the code. (orig.).

20246 (KFK–4960) **Coincidence cross sections within the quasi free break-up model for elastic projectile break-up.** Corcalciuc, V.; Jelitto, H. Kernforschungszentrum Karlsruhe GmbH (Germany). Inst. fuer Kernphysik. Nov 1991. 34p. Order Number DE92511424. Source: OSTI; NTIS (US Sales Only); INIS.

Scrutinizing the basic break-up model of Serber we show that it is possible to derive the triple differential cross sections for particle-particle coincidences in analytical form. An alternative interpretation within the opaque version of the model suggests to assign these cross sections to the elastic nonresonant projectile break-up due to the nuclear interaction. Distortion effects by the Coulomb field of the target are included in analogy to the Serber model. Beside the well known single maximum in the break-up spectra double and triple peak structures appear for certain combinations of the observation angles. The model yields reasonable agreement to the given experimental data, concerning the multiple peak structure as well as the order of magnitude for the absolute normalisation. Its application comprises the region of forward emission angles, especially the angular range of the classical Coulomb deflection. (orig.).

20247 (KIYal–90-12) **Ternary fission products energy properties determination within statistical model.** Lendel, A.I.; Marinets, T.I.; Sikora, D.I.; Charnovich, E.I. AN Ukrainskoj SSR, Kiev (Ukraine). Inst. Yadernykh Issledovanij. 1990. 19p. (In Russian). Order Number DE92627399. Source: OSTI; NTIS (US Sales Only); INIS.

Within the frameworks of statistical model the most probable charges, common excitation energy of ternary fission fragments for ^{232}Th, ^{235,238}U, ^{237}Np, ^{239}Pu, ^{241}Am and ^{249}Cf are obtained. 6 refs.; 14 figs.

(Los Alamos National Lab., NM (United States)); Zumbro, J.D.; Ransome, R.D.; Ritchie, B.G.; Watson, D.L.; Moore, C.F. Los Alamos National Lab., NM (United States). [1991]. 10p. Sponsored by USDOE, Washington, DC (United States); National Science Foundation, Washington, DC (United States); North Atlantic Treaty Organization, Brussels (Belgium); Welch (Robert A.) Foundation, Houston, TX (United States). DOE Contract W-7405-ENG-36. Grant: CRG-890498. (CONF-9106194–8: International workshop on pions in nuclei, Penyscola (Spain), 2-9 Jun 1991). Order Number DE92011285. Source: OSTI; NTIS; INIS; GPO Dep.

Cross sections for pion absorption of T_π = 100 MeV on a range of nuclei leading to two or more energetic protons are presented. A large fraction of the total absorption cross section leads to events with large missing energies, presumably to neutrals. A comparison of the fraction of the total absorption cross section which appears to be the result of an undisturbed two-body mechanism with predictions of a simple semi-classical model of the attenuation of protons through final-state interactions leads to the conclusion that most of the absorption cross section on heavy nuclei is not due to a two-body absorption mechanism followed by final-state interactions but must be the result of pion absorption on three or more nucleons.

20249 (ZfK–751) **Experiment proposals for the 4π fragment spectrometer FOBOS. Reports of the FOBOS Collaboration workshop.** Sodan, H. (ed.). Zentralinstitut fuer Kernforschung, Rossendorf (Germany). Dec 1991. 90p. (In German). Contract BMFT 06DR100. (CONF-9104370–: Workshop of the FOBOS Collaboration, Dresden (Germany), Apr 1991). Order Number DE92516644. Source: OSTI; NTIS (US Sales Only); INIS.

These proceedings contain the articles presented at the named workshop. These are a description of the FOBOS 4π detector of charged particles at Dubna and experiment proposals for this detector concerning multifragmentation as critical phenomenon in hot nuclei, phase transformations in hot nuclei, fission of hot nuclei, research possibilities with radioactive nuclear beams at LNR-JINR, the fission of nuclei with $Z \geq 100$, induced by secondary-beam particles, studies of the fission of excited nuclei by the FOBOS detector, the fission of superdeformed states in the A=190 region, and the formation of light particles in heavy ion collisions and 4Π experiments. (HSI).

20250 (DOE/ER/25086–2) **Fast Algorithms for transport models.** Manteuffel, T. Colorado Univ., Denver, CO (United States). Apr 1992. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG02-90ER25086. Order Number DE92011432. Source: OSTI; NTIS; GPO Dep.

The first two years of this project were mainly focused on developing fast algorithms for the solution of the equations arising from models of single group isotropic transport of neutrally charged particles in slab geometry. In this context, the equation governing transport is an integral-differential equation involving one space variable and one angle variable. This paper discusses the solution of the equations.

20257 (KFK–4946) **FILLC - a subroutine to transfer nuclear group cross-sections from SIGMN blocks to data-arrays of neutron transport codes.** Kuefner, K.; Buckel, G.; Goetzmann, W.; Kiefhaber, E. Kernforschungszentrum Karlsruhe GmbH (Germany). Inst. fuer Neutronenphysik und Reaktortechnik; Kernforschungszentrum Karlsruhe GmbH (Germany). Projekt Nukleare Sicherheitsforschung. Dec 1991. 48p. (In German). Order Number DE92511581. Source: OSTI; NTIS (US Sales Only); INIS.

FILLC is a utility subroutine for use in the KAPROS versions of multigrop S_N codes. Within KAPROS a couple of modules create and modify nuclear cross sections and store them in a so-called SIGMN file. FILLC stores group cross sections in an array C used by some S_N codes with data provided in a SIGMN file. This report documents this interface with release number 3.4. (orig.).

20258 (KFK–4956) **Reference manual for the KfK code PCROSS.** Ravndal, S.; Oblozinsky, P.; Kelzenberg, S.; Cierjacks, S. Kernforschungszentrum Karlsruhe GmbH (Germany). Inst. fuer Materialforschung. Dec 1991. 27p. Order Number DE92511582. Source: OSTI; NTIS (US Sales Only); INIS.

The PCROSS code calculates the so-called 'pseudo' cross sections for sequential (x,n) reactions and merges them together with 'effective' cross section for neutron induced reactions into one file of 'collapsed' cross sections. The file is tailored to provide an input for the FISPACT inventory code that calculates the activation and related radiological quantities of material irradiated in given neutron fields. The report summarizes calculational procedure and provides the reader with essential technical details of the code PCROSS (version 1.0) such as description of parameters, common blocks and subroutines. (orig.).

20259 (LA–12258) **Analytic score comparison of geometry splitting and exponential transform for a simple Monte Carlo problem.** Booth, T.E. Los Alamos National Lab., NM (United States). Mar 1992. 39p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. Order Number DE92013108. Source: OSTI; NTIS; GPO Dep.

The interpretation of the statistical error estimates produced by Monte Carlo transport codes is still somewhat of an art. Empirically, there are variance reduction techniques whose error estimates are almost always reliable and there are variance reduction techniques whose error estimates are often unreliable. Unreliable error estimates usually result from inadequate large score sampling from the score distribution's tail. This paper provides the analytic score distribution for geometry splitting/Russian roulette applied to a simple Monte Carlo problem and the analytic score distribution for the exponential transform applied to the same Monte Carlo problem. It is shown that the large score tails of the two distributions behave very differently. In particular, the exponential transform is shown to have an infinite variance for some parameter choices.

20260 (SAND–91-1634) **ITS Version 3.0: The Integrated TIGER series of coupled electron/photon Monte Carlo transport codes.** Halbleib, J.A. (Sandia National Labs., Albuquerque, NM (United States)); Kensek, R.P.; Mehlhorn, T.A.; Valdez, G.D.; Seltzer, S.M.; Berger, M.J. Sandia National Labs., Albuquerque, NM (United States). Mar 1992. 132p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-76DP00789. Order Number DE92011518. Source: OSTI; NTIS; GPO Dep.

ITS is a powerful and user-friendly software package permitting state-of-the-art Monte Carlo solution of linear time-independent coupled electron/photon radiation transport problems, with or without the presence of macroscopic electric and magnetic fields of arbitrary spatial dependence. Our goal has been to simultaneously maximize operational simplicity and physical accuracy. Through a machine-portable utility that emulates the basic features of the CDC UPDATE processor, the user selects on of eight codes for running on a machine of one of at least four major vendors. The ease with which this utility is applied combines with an input scheme based on order-independent descriptive keywords that makes maximum use of defaults and internal error checking to provide experimentalists and theorists alike with a method for the routine but rigorous solution of sophisticated radiation transport problems. Physical rigor is maximized by employing the best available cross sections and sampling distributions, and the most complete physical model for describing the production and transport of the electron/photon cascade from 1.0 GeV down to 1.0 keV. Feasibility of construction permits the more sophisticated user to tailor the codes to specific applications and to extend the capabilities of the codes to more complex applications through simple update procedures. Version 3.0, the latest version of ITS, contains major improvements to the physical model, additional variance reduction via both internal restructuring and new user options, and expanded input/output capabilities.

20261 (SAND–92-0065C) **Cautions in using x-ray measurements derived from broad spectral response functions to determine the peak voltage of flash bremsstrahlung sources.** Fehl, D.L.; Baldwin, G.T.; Lorence, L.J. Jr. Sandia National Labs., Albuquerque, NM (United States). [1992]. 12p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-76DP00789. (CONF-920362–11: 9. topical conference on high-temperature plasma diagnostics, Santa Fe, NM (United States), 15-19 Mar 1992). Order Number DE92011154. Source: OSTI; NTIS; GPO Dep.

Because a direct measurement of the voltage (V) is pulsed power bremsstrahlung sources can be difficult, the energy spectrum of X- rays emitted is sometimes used to infer V. Both the voltage and current in such sources vary with time. Moreover, for modern x-ray simulators with multiple cathodes, multiple voltages may exist simultaneously. We demonstrate here how such sources lead to systematic errors in several types of simple-to-field x-ray voltage measurements, especially those with broad spectral response functions, when calibrated against constant-potential bremsstrahlung spectra. 11 refs.

20262 (UCRL-CR–109223) **Advanced computational transport methods for curvilinear geometries: Final report.** Martin, W.R. (Michigan Univ., Ann Arbor, MI (United States). Dept. of Nuclear Engineering); Larsen, E.W.; Palmer, T.S.; Adams, M.L. Lawrence Livermore National Lab., CA (United States); Michigan Univ., Ann Arbor, MI (United States). Dept. of Nuclear Engineering. 30 Oct 1991. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. Order Number DE92011290. Source: OSTI; NTIS; GPO Dep.

During the last year, a considerable effort was mounted to devise accurate and efficient numerical methods for the solution of curvilinear transport problems in the optically thick, diffusive regime. Much work has already been completed on these methods in slab and x-y geometries. The principle tool in designing these methods is an asymptotic analysis that permits one to theoretically assess the accuracy of a transport numerical method for diffusive regions in which the spatial grid is optically thick. A transport numerical method is said to be accurate for thick, diffusive problems if an asymptotic analysis yields an accurate discretized diffusion equation and accurate boundary conditions. If a given transport discretization has this property, then it is possible to incorporate this "asymptotic" diffusion equation into a diffusion synthetic acceleration (DSA) algorithm that will yield a very rapidly convergent iterative solution. The search for efficiently solvable DSA algorithms in one and two spatial dimensions has been going on for the past 20 years. Although many techniques are available now in one-dimensional geometries, in other geometries only the diamond differenced S_N equations have been efficiently solved using conventional DSA. This is because this particular transport differencing yields a sufficiently simple low-order diffusion equation that lends itself to solution by multigrid methods. Conventional DSA when applied to most other transport discretizations leads to more complicated discrete diffusion equations that are not as efficiently solvable. The asymptotic analysis procedure outline here is an attempt to overcome this obstacle.

Ten students participated in the 1991 summer high school student research program at the University of Rochester's Laboratory for Laser Energetics (LLE). The participants spent 8 weeks working and learning at LLE. They spent most of their time working on individual research projects. Each student was assigned a project, upon which he/she worked under the direct supervision of one of the staff members of the laboratory. The students, their high schools, and their projects are listed in Table 1. The program culminated in oral and written reports describing their work. The oral reports were presented at a symposium on 23 August 1991, at which the student's parents and teachers and members of the LLE staff were present. The written reports are collected in this volume. The titles of the works are UV alignment table; neutron yields can be measured by using the relative gain of a photomultiplier tube; scattering in isotropic and anisotropic media; a better approximation of the diffusion equation; use of the SLAC code to produce a photoemissive electrostatic electron gun; spatial resolution deteriorates with increasing film exposure; analysis of refractive image distortion; making of pinholes for x-ray pinhole cameras; does perturbation theory accurately describe multiphoton ionization? and wave front analysis using shearing interferometry.

This report summarizes our research progress to date on the use of multigrid methods for three-dimensional elliptic partial differential equations, with particular emphasis on application to the Poisson-Boltzmann equation of molecular biophysics. This research is motivated by the need for fast and accurate numerical solution techniques for three-dimensional problems arising in physics and engineering. In many applications these problems must be solved repeatedly, and the extremely large number of discrete unknowns required to accurately approximate solutions to partial differential equations in three-dimensional regions necessitates the use of efficient solution methods. This situation makes clear the importance of developing methods which are of optimal order (or nearly so), meaning that the number of operations required to solve the discrete problem is on the order of the number of discrete unknowns. Multigrid methods are generally regarded as being in this class of methods, and are in fact provably optimal order for an increasingly large class of problems. The fundamental goal of this research is to develop a fast and accurate numerical technique, based on multi-level principles, for the solutions of the Poisson-Boltzmann equation of molecular biophysics and similar equations occurring in other applications. An outline of the report is as follows. We first present some background material, followed by a survey of the literature on the use of multigrid methods for solving problems similar to the Poisson-Boltzmann equation. A short description of the software we have developed so far is then given, and numerical results are discussed. Finally, our research plans for the coming year are presented.

(Germany). Theoretical Physics Dept.); Sepp, W.D.; Fricke, B.; Kolb, D.; Ionova, G.V.; Schaedel, M. Gesellschaft fuer Schwerionenforschung mbH, Darmstadt (Germany). Jan 1992. 31p. Order Number DE92516789. Source: OSTI; NTIS (US Sales Only); INIS.

Relativistic SCC-DS-DVM calculations have been done for the series of molecules MBr_5, where M = Nb, Ta, Pa, and element 105, Ha. The electronic structure data show that the trends within the group 5 pentabromides resemble those for the corresponding pentaclorides with the latter being more ionic. Estimation of the volatility of group 5 bromides has been done on the basis of the molecular orbital calculations. According to the results of the theoretical interpretation $HaBr_5$ should be more volatile than $NbBr_5$ and $TaBr_5$. (orig.).

20266 (INIS-mf–13178, pp. 10-19) **Small metal particles and the ideal Fermi gas.** Barma, Mustanpir (Tata Inst. of Fundamental Research, Bombay (India)). Department of Atomic Energy, Bombay (India). Board of Research in Nuclear Sciences. 1991. 269p. (CONF-8912137–: Solid state physics symposium, Madras (India), 19-22 Dec 1989). In *Proceedings of the solid state physics symposium: Combined Vol. 32A and Vol. 33A: Invited talks.* Order Number DE92001361. Source: OSTI; NTIS (US Sales Only); INIS.

Kubo's theoretical model of a small metal particle consists of a number of noninteraction electrons (an ideal Fermi gas) confined to a finite volume. By 'small' it meant that the size of the particle is intermediate between that of a few atoms cluster and the bulk solid, the radius of the particle being 5 to 50 Angstroms. The model is discussed and size dependence of various energy scales is studied. For a fermi gas confined in a sphere or a cube, two size-dependent energy scales are important. The inner scale δ is the mean spacing between successive energy levels. It governs the very low temperature behaviour. The outer scale Δ is associated with the shell structure when $\delta \leq T < \Delta$, thermodynamic properties show an oscillatory fluctuations around a smooth background as the size or energy is varied. (M.G.B.) 23 refs.

20267 (INIS-mf–13178, pp. 26-49) **Electronic structure of interfaces.** Das, G.P. (Bhabha Atomic Research Centre, Bombay (India). Solid State Physics Div.). Department of Atomic Energy, Bombay (India). Board of Research in Nuclear Sciences. 1991. 269p. (CONF-8912137–: Solid state physics symposium, Madras (India), 19-22 Dec 1989). In *Proceedings of the solid state physics symposium: Combined Vol. 32A and Vol. 33A: Invited talks.* Order Number DE92001361. Source: OSTI; NTIS (US Sales Only); INIS.

A unified theoretical approach based on linear muffin-tin orbital method is presented to study epitaxial solid-solid interfaces. Metal ceramic interfaces, insulator semiconductor interface and metal semiconductor interface are discussed. (M.G.B.). 80 refs ., 12 figs.

Source: OSTI; NTIS (US Sales Only); INIS.

A general theory of hyperfine shifts of X radiation K, L_{I-III}, ...-levels induced under arbitrary electron captures is constructed. A shift of gravity center of an X radiation level induced under electron capture is determined. An expression for population of hyperfine structure components excited under electron capture is derived. 8 refs.

20270 (UCRL-JC–109000) **Korringa-Kohn-Rostoker electronic structure method for space-filling cell potentials.** Gonis, A. (Lawrence Livermore National Lab., CA (United States)); Butler, W.H.; Zhang, X.-G. Oak Ridge National Lab., TN (United States). [1991]. 13p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400 ;W-7405-ENG-48. (CONF-911202–39: Annual fall meeting of the Materials Research Society, Boston, MA (United States), 2-6 Dec 1991). Order Number DE92006596. Source: OSTI; NTIS; GPO Dep.

The multiple scattering theory (MST) method of Korringa, and of Kohn and Rostoker for determining the electronic structure of solids, originally developed in connection with potentials bounded by non-overlapping spheres (muffin-tin (MT) potentials), is generalized to the case of space-filling potential cells of arbitrary shape through the use of a variational formalism. This generalized version of MST retains the separability of structure and potential characteristic of the application of MST to MT potentials. However, in contrast to the MT case, different forms of MST exhibit different convergence rates for the energy and the wave function. Numerical results are presented which illustrate the differing convergence rates of the variational and nonvariational forms of MST for space-filling potentials.

This report summarises the work done by members of the Spectroscopy Division both within BARC as well as in scientific institutions elsewhere during the calendar year 1990. Main areas of research activity include atomic spectroscopy for hyperfine structure and isotope shift determination, theoretical and experimental studies of diatomic molecules, infrared and Raman spectroscopy of polyatomic molecules, design and fabrication of beam line optics for INDUS-I synchrotron radiation source, beam foil spectroscopy and laser spectroscopy of various atomic and molecular systems. Major experimental facilities that have been utilised include a fourier transform spectrometer, an excimer laser pumped dye-laser and a continous wave argon-ion laser. The report also includes the spectroscopic analytical service rendered for various DAE units and describes briefly some new analytical facilities like laser enhanced ionization in flames and resonance ionization mass spectroscopy using pulsed lasers which are being set up. The above activites were reported by members of the Spectroscopy Division via invited lectures, papers presented in various national and international conferences and publication in scientific journals. Details of these are given at the end of the report. (author). figs., tabs.

20272 (DOE/ER/13965–4) **Spectroscopic probes of vibrationally excited molecules at chemically significant energies: Progress report, August 15, 1991–August 14, 1992.** Rizzo, T.R. Rochester Univ., NY (United States). Mar 1992. 8p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG02-88ER13965. Order Number DE92011026. Source: OSTI; NTIS; INIS; GPO Dep.

These experiments apply multiple-laser spectroscopic techniques to investigate the bond energies, potential surface topologies, and dissociation dynamics of highly vibrationally excited molecules. Infrared-optical double resonance pumping of light atom stretch vibrations in H_2O_2 and HN_3 prepares reactant molecules in single rovibrational states above the unimolecular dissociation threshold on the ground potential surface, and laser induced fluorescence detection of the OH or NH fragments monitors the partitioning of energy into individual product quantum states. Product energy partitioning data from H_2O_2 dissociation provide a stringent test of statistical theories as well as potential energy surface calculations. Ongoing work on HN_3 seeks to determine the height of the barrier to dissociation on the singlet potential energy surface. Our most recently developed spectroscopic scheme allows the measurement of high vibrational overtone spectra of jet-cooled molecules. This approach uses CO_2 laser infrared multiphoton dissociation followed by laser induced fluorescence product detection to measure weak vibrational overtone transitions in low pressure environments. Application of this scheme to record the $\Delta V_{OH}=4$ and $\Delta V_{OH}=5$ transitions of CH_3OH cooled in a supersonic free-jet demonstrates both its feasibility and its utility for simplifying high vibrational overtone spectra.

Ionic crystals doped with ns^2 ions belong to candidates for tunable solid state laser materials. For the absorption and emission of ns^2 ions, the most important interactions are spin-orbital interactions, singlet-triplet mixing and the Jahn-Teller effect. For the group of potassium halide crystals doped with a low concentration of Pb^{2+} ions, the results are presented of measurements of actual decay. Time resolved luminescence spectroscopy was used. The experiments carried out indicate that the phenomenon of alkali-halide ns^2 phosphor emission is more complicated than would follow from results published up to now. (Z.S.). 1 fig., 1 tab., 6 refs.

20275 (LRAP–119) **Progress report 1989-90.** Lund Univ. (Sweden). Dept. of Physics. [1991]. 118p. Order Number DE92624995. Source: OSTI; NTIS (US Sales Only); INIS.

Research on emission spectroscopy and term analysis is being pursued with emphasis on the analysis of the spectra of multiply ionized inert gases. In the basic atomic laser spectroscopy group the experimental activities employing CW high-resolution techniques and time-resolved methods are well integrated with a theoretical atomic physics programme. A precision method for lifetime measurements using a mode-locked dye laser in conjunction with photon counting techniques has been further refined. Pulsed level-crossing, optical-double-resonance and quantum-beat spectroscopy have been used extensively to attain new accurate data. Studies of terawatt laser generation techniques have been made in preparation for the establishment of such techniques at the Lund Laser Center. For several years, a major project concerned with combustion diagnostics using lasers has been pursued in Lund. Many aspects of flame kinetics, NO_x and soot formation, turbulence and spark ignition are being studied using laser-induced fluorescence. Raman and CARS spectroscopy. Theoretical work on kinetics and spark ignition supplements the extensive programme. Methods for combustion diagnostics based on multicolour imaging, degenerate four-wave mixing and diode-laser frequencymodulation spectroscopy are being developed. Environmental remote sensing using optical techniques is another applied spectroscopy project. Our mobile lidar system has been extensively used for range-resolved mapping of atomic mercury. During the last two years our activities in the medical field have increased. A research programme on cancer tumour detection and treatment using lasers is being pursued jointly with the Lund University Hospital. Work on spectroscopic diagnostics of atherosclerotic plaque is also being actively pursued, aiming at spectroscopic guidance in fibreoptic plaque ablation using excimer laser radiation. Measurements have been performed during open-heart surgery.

20276 (UCRL-JC–104651) **Spectroscopic diagnostics of ionization balance and electron density in 20 picosecond laser-produced aluminum and magnesium plasmas.** Osterheld, A.L.; Shepherd, R.L.; Eder, D.; Walling, R.S.; Keane, C.; Matthews, D.; Young, B.K.F.; Goldstein, W.H.; Stewart, R.E.; Charatis, G. Lawrence Livermore National Lab., CA (United States). Jan 1991. 6p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. From 17. international conference on the physics of electronic and atomic collisions; Brisbane (Australia); 10-16 Jul 1991. Order Number DE92011779. Source: OSTI; NTIS; INIS; GPO Dep.

The first angular distribution measurements of Auger electrons arising from transfer and excitation Auger (TE) processes were performed at O^{5+} projective energies of 8 MeV, where the resonant (RTE) and the nonresonant (NTE) transfer and excitation have equal contributions in populating the $(1s2s2p^2)^3D$ state, and at 13 MeV where RTE is predominant and at 6 MeV where NTE is more significant. The TE angular distributions are strongly forward peaked along the beam direction. The data were fitted to $w(\theta_p)=C[1+a_2P_2(\cos\theta_p)+a_4P_4(\cos\theta p)]$ and the magnetic substate population probabilities were inferred.

20278 (DOE/ER/13262–8) **Excitation of atoms and molecules in collisions with highly charged ions: Progress report, January 1, 1991–March 1, 1992.** Watson, R.L. This report discusses research of multicharged nitrogen, oxygen and carbon monoxide molecular ions produced with collision with multicharged argon ions. Properties like ionization, dissociation, and excitation are investigated. (LSP)

20279 (ESM–33) **New applications of (e,2e) techniques.** Weigold, E. Flinders Univ. of South Australia, Adelaide (Australia). Electronic Structure of Materials Centre. Jul 1991. 12p. (CONF-910746–: 17. international conference on the physics of electronic and atomic collisions, Brisbane (Australia), 10-16 Jul 1991). Order Number DE92627428. Source: OSTI; NTIS (US Sales Only); INIS.

The flexibility of the (e,2e) technique in obtaining information on both structure and collision dynamics is demonstrated. Examples of structure information are electron momentum spectroscopy studies of laser excited Na atoms and amorphous carbon films. The role of post-collision effects and correlations is explored by measurements in the autoionising region of helium and in innershell ionisation of argon. 26 refs., 11 figs.

(Gesellschaft fuer Schwerionenforschung mbH, Darmstadt (Germany)); Kozhuharov, C.; Livingston, A.E.; Mokler, P.H.; Stachura, Z.; Warczak, A. Gesellschaft fuer Schwerionenforschung mbH, Darmstadt (Germany). Dec 1991. 13p. Grant KBN 201779101. Order Number DE92516498. Source: OSTI; NTIS (US Sales Only); INIS.

Radiative Electron Capture (REC) in 4 to 12 MeV/u $Ge^{31+}\rightarrow H_2$ collisions has been studied using an X-ray/particle coincidence technique. This technique allowed a systematic investigation of K-shell REC as well as a separation of REC into the projectile L- and M-shells. The cross sections are discussed within a general scaling picture based on the reduced projectile velocity. (orig.).

Calculation of the matrix elements between wave functions of electronic states which fall into the continuous region of the energy spectrum is a prerequisite when solving certain problems associated with electron scattering in solids. A fast numeric method is reported on; it has been developed for the calculation of radiative matrix elements in problems involving a spherical symmetric potential inside a finite region. Outside that region, analytical integration is performed. Particular attention is paid to the numerical stability with regard to the high energy of the incident electrons (higher than 5 keV) which are described by rapidly oscillating functions. The method enables calculation of higher order terms in the multipole series. The problem in question arose during investigation of the scattering process in bremsstrahlung isochromatic spectroscopy. The fast incident electron is slowed down by the Coulomb field of the scattering atom, and a photon is emitted; the latter is measured with an isochromatic detector. (Z.S.). 11 refs.

20282 (NEI-NO-192) **Studies of collision dynamics in electron capture processes.** Hansen, J.P. Oslo Univ. (Norway). Fysisk Inst. Dec 1989 131p. Order Number DE92628654. Source: OSTI; NTIS (US Sales Only); INIS.

Reprints of ten previously printed papers are attached.

The thesis presents some recent development in time-dependent coupled channel methods for one- and two-electron systems. The methods have been applied to detailed studies on several different aspects of charge transfer processes in ion-atom collisions at intermediate to low energies. Measurable quantities, such as partial and total cross sections, partial cross sections in projectile energy gain, orientation and alignment fractions, have been calculated. Confrontation with experiments has in general given good agreement. 14 refs., 2 figs.

DOE Contract W-7405-ENG-48. (CONF-920318-1: International workshop on dynamical fluctuations and correlations in nuclear collisions, Aussois (France), 12-16 Mar 1992). Order Number DE92011760. Source: OSTI; NTIS; INIS; GPO Dep.

MOLECULAR DYNAMICS has been generalized in order to simulate a variety of NONEQUILIBRIUM systems. This generalization has been achieved by adopting microscopic mechanical definitions of macroscopic thermodynamic and hydrodynamic variables, such as temperature and stress. Some of the problems already treated include rapid plastic deformation, intense heat conduction, strong shockwaves simulation, and far-from-equilibrium phase transformations. Continuing advances in technique and in the modeling of interatomic forces, coupled with qualitative improvements in computer hardware, are enabling such simulations to approximate real-world microscale and nanoscale experiments.

Carbon dioxide presents a great challenge to spectroscopy because of its propensity toward dissociation in all of its excited states. Multiphoton ionization spectroscopy is usually not applicable to the study of dissociating molecules because the dissociation competes effectively with ionization, resulting in no signal. We reasoned, however, that with high enough laser fluence, ionization could compete with dissociation in the longer lived states, exposing them for study from the continuous spectral background resulting from rapidly dissociating states. We describe the various spectroscopic and photophysical effects found through the multiphoton ionization and multiphoton photoelectron spectra. A recently developed variant of threshold ionization spectroscopy, usually called ZEKE, has shown a great deal of usefulness in providing the same information as traditional photoelectron spectroscopy but with higher resolution and much better signal-to-noise when using standard laboratory lasers. Threshold ionization techniques locate the states of an ion by scanning a light source across the ionization continuum of a neutral and somehow detecting when electrons are produced with no kinetic energy. We chose to develop our capabilities in threshold ionization spectroscopy using aromatic molecules because of their importance and because their electronic structure allows a pump-probe type of excitation scheme which avoids the use of vacuum ultraviolet laser beams. Among aromatics, the azines are noted for their small S_1-T_1 energy gap which give them unique and interesting photophysical properties. We have continued our work on the multiphoton spectrum of metastable nitrogen produced by an electric discharge in supersonic beam. We have been able to assign more of the lines and simulated their rotational structure but many peaks remain unassigned.

Intermolecular energy transfer of highly excited polyatomic molecules plays an important role in many complex chemical systems: combustion, high temperature and atmospheric chemistry. By monitoring the relaxation of internal energy we have observed trends in the collisional efficiency (β) for energy transfer as a function of the substrate's excitation energy and the complexities of substrate and deactivator. For a given substrate β increases as the deactivator's mass increase to ~30 amu and then exhibits a nearly constant value; this is due to a mass mismatch between the atoms of the colliders. In a homologous series of substrate molecules (C_3-C_8) β decreases as the number of atoms in the substrate increases; replacing F with H increases β. All substrates, except for CF_2Cl_2 and CF_2HCl below 10,000 cm^{-1}, exhibited that β is independent of energy, i.e. $<\Delta E>_{all}$ is linear with energy. The results are interpreted with a simple model which considers that β is a function of the ocillators energy and its vibrational frequency. Limitations of current approximations used in high temperature unimolecular reactions were evaluated and better approximations were developed. The importance of energy transfer in product yields was observed for the photoactivation of perfluorocyclopropene and the photoproduction of difluoroethyne. 3 refs., 18 figs., 4 tabs.

Experiments have given evidence that the Ginzburg-Landau theory applies to high-T_C superconductors; the coherence length, however, is considerably shorter than for conventional superconductors, viz., it is of the order of tenths of nm, which is comparable with the lattice parameters. As a consequence, planar defects in crystals such as grain boundaries or domain boundaries are a hindrance to the superconductor current. Thus, polycrystalline ceramic samples as well as single crystals do not behave as homogeneous materials; instead, they behave as systems of superconducting granules mutually bonded by weak Josephson junctions. These phenomena are demonstrated on an $YBa_2Cu_3CO_7$ single crystal. Measurements of magnetization curves in a weak magnetic field using a SQUID magnetometer were useful in examining the Josephson environment. Observation of the individual Josephson junctions inside the ceramics was accomplished on tip contacts. (Z.S.). 5 refs.

Thesis. Submitted to University of Tennessee, Knoxville, TN.

Multiphoton ionization (MPI) time-of-flight mass spectroscopy and photoelectron spectroscopy studies of UF_6 have been conducted using focused light from the Nd:YAG laser fundamental (λ=1064 nm) and its harmonics (λ=532, 355, or 266 nm), as well as other wavelengths provided by a tunable dye laser. The MPI mass spectra are dominated by the singly and multiply charged uranium ions rather than by the UF_x^+ fragment ions even at the lowest laser power densities at which signal could be detected. The laser power dependence of U^{n+} ions signals indicates that saturation can occur for many of the steps required for their ionization. In general, the doubly-charged uranium ion (U^{2+}) intensity is much greater than that of the singly-charged uranium ion (U^+). For the case of the tunable dye laser experiments, the U^{n+} (n = 1- 4) wavelength dependence is relatively unstructured and does not show observable resonance enhancement at known atomic uranium excitation wavelengths. The dominance of the U^{2+} ion and the absence or very small intensities of UF_x^+ fragments, along with the unsaturated wavelength dependence, indicate that mechanisms may exist other than ionization of bare U atoms after the stepwise photodissociation of F atoms from the parent molecule.

The beam-foil method has been used to investigate atomic structure and decay characteristics like lifetimes and transition probabilities. Studies of transition probabilities in Ne-like ions. These systems have attracted much interest since they are candidates for short-wavelength lasers. Investigation of core-excited states in the Na-isoelectronic sequence. These states are found above the first ionization limit and have a complicated decay scheme, involving both radiative and autoionization modes. Spectroscopic analyses of He- and Na-like systems. Here the emphasis is on obtaining accurate estimates of the quantum electrodynamic contributions to the groundstate energy. Lifetime measurements of multiply excited levels in FV. This study shows how fine details in the atomic structure may drastically affect the lifetimes. Decay properties in Al-like ions. An anomalous intensity ratio between several resonance transitions in the Al isoelectronic sequence is observed experimentally and investigated with different theoretical models. The lifetimes of low-lying quartet levels in Al-like ions have also been measured and compared with theoretical calculations. Spectral analyses of highly ionized bromine. The analyses have extended the earlier studies of Cr-, Mn- and Fe-like Br to incorporate also the lowest excited, metastable configurations.

20290 (CONF-9105202–, pp. 7, Paper 12) **Moving finite elements: A continuously adaptive method for computational fluid dynamics.** Glasser, A.H. (Los Alamos National Lab., NM (United States)); Miller, K.; Carlson, N. USDOE Office of Energy Research, Washington, DC (United States). Scientific Computing Staff. [1991]. From 1. energy research power supercomputer users symposium; Gaithersburg, MD (United States); 21-22 May 1991. In *Proceedings of the first energy research power supercomputer users symposium.* 173p. Order Number DE91018877. Source: OSTI; NTIS; INIS.

Moving Finite Elements (MFE), a recently developed method for computational fluid dynamics, promises major advances in the ability of computers to model the complex behavior of liquids, gases, and plasmas. Applications of computational fluid dynamics occur in a wide range of scientifically and technologically important fields. Examples include meteorology, oceanography, global climate modeling, magnetic and inertial fusion energy research, semiconductor fabrication, biophysics, automobile and aircraft design, industrial fluid processing, chemical engineering, and combustion research. The improvements made possible by the new method could thus have substantial economic impact. Moving Finite Elements is a moving node adaptive grid method which has a tendency to pack the grid finely in regions where it is most needed at each time and to leave it coarse elsewhere. It does so in a manner which is simple and automatic, and does not require a large amount of human ingenuity to apply it to each particular problem. At the same time, it often allows the time step to be large enough to advance a moving shock by many shock thicknesses in a single time step, moving the grid smoothly with the solution and minimizing the number of time steps required for the whole problem. For 2D problems (two spatial variables) the grid is composed of irregularly shaped and irregularly connected triangles which are very flexible in their ability to adapt to the evolving solution. While other adaptive grid methods have been developed which share some of these desirable properties, this is the only method which combines them all. In many cases, the method can save orders of magnitude of computing time, equivalent to several generations of advancing computer hardware.

This report discusses the following topics: Rayleigh-Benard convection with an imposed horizontal flow; Rayleigh-Benard convection in a gas under non-boussinesq conditions; electro- convection in a nematic liquid crystal; and Rayleigh-Benard convection in a nematic liquid crystal. (LSP)

20292 (EGG-WTD–9845) **A computational model for viscous fluid flow, heat transfer, and melting in in situ vitrification melt pools.** McHugh, P.R.; Ramshaw, J.D. EG and G Idaho, Inc., Idaho Falls, ID (United States). Nov 1991. 97p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC07-76ID01570. Order Number DE92012215. Source: OSTI; NTIS; INIS; GPO Dep.

MAGMA is a FORTRAN computer code designed to viscous flow in in situ vitrification melt pools. It models three-dimensional, incompressible, viscous flow and heat transfer. The momentum equation is coupled to the temperature field through the buoyancy force terms arising from the Boussinesq approximation. All fluid properties, except density, are assumed variable. Density is assumed constant except in the buoyancy force terms in the momentum equation. A simple melting model based on the enthalpy method allows the study of the melt front progression and latent heat effects. An indirect addressing scheme used in the numerical solution of the momentum equation voids unnecessary calculations in cells devoid of liquid. Two-dimensional calculations can be performed using either rectangular or cylindrical coordinates, while three-dimensional calculations use rectangular coordinates. All derivatives are approximated by finite differences. The incompressible Navier-Stokes equations are solved using a new fully implicit iterative technique, while the energy equation is differenced explicitly in time. Spatial derivatives are written in conservative form using a uniform, rectangular, staggered mesh based on the marker and cell placement of variables. Convective terms are differenced using a weighted average of centered and donor cell differencing to ensure numerical stability. Complete descriptions of MAGMA governing equations, numerics, code structure, and code verification are provided. 14 refs.

20294 (JSR-90-310) **Continuum approaches for describing solid-gas and solid-liquid flow.** Diamond, P.; Harvey, J.; Levine, H.; Steinhardt, P.; Westervelt, R. Mitre Corp., McLean, VA (United States). Jason Program Office. Feb 1992. 53p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AI05-90ER30174. Order Number DE92013601. Source: OSTI; NTIS; GPO Dep.

Two-phase continuum models have been used to describe the multiphase flow properties of solid-gas and solid-liquid mixtures. The approach is limited in that it requires many fitting functions and parameters to be determined empirically, and it does not provide natural explanations for some of the qualitative behavior of solid-fluid flow. In this report, we explore a more recent single-phase continuum model proposed by Jenkins and Savage to describe granular flow. Jenkins and McTigue have proposed a modified model to describe the flow of dense suspensions, and hence, many of our results can be straight-forwardly extended to this flow regime as well. The solid-fluid mixture is treated as a homogeneous, compressible fluid in which the particle fluctuations about the mean flow are described in terms of an effective temperature. The particle collisions are treated as inelastic. After an introduction in which we briefly comment on the present status of the field, we describe the details of the single-phase continuum model and analyze the microscopic and macroscopic flow conditions required for the approach to be valid. We then derive numerous qualitative predictions which can be empirically verified in small-scale experiments: The flow profiles are computed for simple boundary conditions, plane Couette flow and channel flow. Segregaion effects when there are two (or more) particle size are considered. The acoustic dispersion relation is derived and shown to predict that granular flow is supersonic. We point out that the analysis of flow instabilities is complicated by the finite compressibility of the solid-fluid mixture. For example, the large compressibility leads to interchange (Rayleigh-Taylor instabilities) in addition to the usual angular momentum interchange in standard (cylindrical) Couette flow. We conclude by describing some of the advantages and limitations of experimental techniques that might be used to test predictions for solid-fluid flow. 19 refs.

20295 (LA-12284-T) **Spectral self-similarity of homogeneous anisotropic turbulence.** Clark, T.T. Los Alamos National Lab., NM (United States). Apr 1992. 318p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. Order Number DE92013056. Source: OSTI; NTIS; GPO Dep.

Thesis. Submitted to University of New Mexico, Albuquerque.

A spectral model of turbulence is used to study the behavior of homogeneous turbulence subjected to homogeneous mean flow gradients and turbulence which freely decays. The model predictions agree quantitatively with experimental data for turbulence subjected to irrotational strains and qualitatively with experimental data for turbulence subjected to homogeneous shears and freely decaying anisotropic turbulence. The model predicts two different large-time asymptotic states. One state is characteristic of turbulence subjected to time-variant homogeneous mean flow gradients. The other state is characteristic of freely decaying turbulence. For turbulence subjected to homogeneous mean flow gradients, the Reynolds tensor components grow exponentially in time, the Reynolds stress anisotropy becomes constant in time and the spectral tensor approaches a self-similar form. The self-similar spectral shapes depend on the structure of the imposed mean flow gradients and may vary between components of the spectral tensor. For freely decaying anisotropic turbulence the Reynolds tensor components approach a power-law decay in time and the spectral tensor approaches a self-similar form that possesses only two shape function--one for the energy spectrum, and the other for the deviatoric spectral tensor components. The spectral model predicts the experimentally observed variations in rates of return to isotropy. Based on these predictions, it is argued that experimentally observed variations in the rates of return to isotropy may be explained as a spectral transition. During straining the experiments the turbulence tends toward the self-similar form characteristic of the imposed strain.

20296 (UCRL-JC-108753) **Self-consistent-field KKR-CPA calculations in the atomic-sphere approximations.** Singh, P.P. Gonis, A. (Lawrence Livermore National Lab., CA (United States)); de Fontaine, D. Lawrence Livermore National Lab., CA (United States). 3 Dec 1991. 8p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48 ;AC03-76SF00098. (CONF-911202-73: Annual fall meeting of the Materials Research Society, Boston, MA (United States), 2-6 Dec 1991). Order Number DE92011525. Source: OSTI; NTIS; GPO Dep.

We present a formulation of the Korringa-Kohn-Rostoker coherent potential approximation (KKR-CPA) for the treatment of substitutionally disordered alloys within the KKR atomic-sphere approximations (ASA). This KKR-ASA-CPA represents the first step toward the implementation of a full cell potential CPA, and combines the accuracy of the KKR-CPA method with the flexibility of treating complex crystal structures. The accuracy of this approach has been tested by comparing the self-consistent-field (SCF) KKR-ASA-CPA calculations of Cu-Pd alloys with experimental results and previous SCF-KKR-CPA calculations.

Lawrence Livermore National Lab., CA (United States). 13 Nov 1991. 8p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48 ;AC05-84OR21400. (CONF-911202-69: Annual fall meeting of the Materials Research Society, Boston, MA (United States), 2-6 Dec 1991). Order Number DE92011470. Source: OSTI; NTIS; GPO Dep.

We investigate techniques for solving the wave equation which are based on the idea of obtaining exact local solutions within each potential cell, which are then joined to form a global solution. We derive full potential multiple scattering theory (MST) from the Lippmann-Schwinger equation and show that is as well as a closely related cellular method are techniques of this type. This cellular method appears to have all of the advantages of MST and the added advantage of having a secular matrix with only nearest neighbor interactions. Since this cellular method is easily linearized one can rigorously reduce electronic structure calculations to the problem of solving a nearest neighbor tight-binding problem.

(CONF-901035-22: 37. national American Vacuum Society symposium, Toronto (Canada), 8-12 Oct 1990; RU-57-90). Order Number DE92012211. Source: OSTI; NTIS; GPO Dep.

We have used Auger photoelectron coincidence spectroscopy to study the $M_{4,5}VV$ Auger spectra of GaAs(110). Using this technique, the Ga and As spectra can be separated and studied independently. The lineshape of the As-$M_{4,5}VV$ measured in coincidence with the As 3d photoemission line differs significantly from the conventional Auger spectrum. We attribute this to the surface electronic properties of the system. In addition, we have found that the ss-component of the As spectrum is more intense than expected based on calculations using atomic matrix elements. The Ga-$M_{4,5}VV$ spectrum, of which only the pp-component is observed, agrees well with that expected from an independent electron model. A first principles electronic structure calculation of a 5-layer GaAs(110) slab has been performed to aid in the interpretation of the Auger spectra.

20299 (CONF-9109256–2) **Sub-Å microscopy through incoherent imaging and image reconstruction.** Pennycook, S.J. (Oak Ridge National Lab., TN (United States)); Jesson, D.E.; Chisholm, M.F.; Ferridge, A.G.; Seddon, M.J. Oak Ridge National Lab., TN (United States). Mar 1992. 28p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. From 10. Pfefferkorn conference on signal and image processing in microscopy and microanalysis; Cambridge (United Kingdom); 16-19 Sep 1991. Order Number DE92011787. Source: OSTI; NTIS; INIS; GPO Dep.

Z-contrast scanning transmission electron microscopy (STEM) with a high-angle annular detector breaks the coherence of the imaging process, and provides an incoherent image of a crystal projection. Even in the presence of strong dynamical diffraction, the image can be accurately described as a convolution between an object function, sharply peaked at the projected atomic sites, and the probe intensity profile. Such an image can be inverted intuitively without the need for model structures, and therefore provides the important capability to reveal unanticipated interfacial arrangements. It represents a direct image of the crystal projection, revealing the location of the atomic columns and their relative high-angle scattering power. Since no phase is associated with a peak in the object function or the contrast transfer function, extension to higher resolution is also straightforward. Image restoration techniques such as maximum entropy, in conjunction with the 1.3 Å probe anticipated for a 300 kV STEM, appear to provide a simple and robust route to the achievement of sub-Å resolution electron microscopy.

20300 (CONF-9110340–) **DOE/DMS workshop on future synchrotron VUV and x-ray beam Lines.** Green, P.H. (comp.). Oak Ridge National Lab., TN (United States). Mar 1992. 163p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. From DOE/DMS workshop on future synchrotron VUV X-ray beam lines; Gatlinburg, TN (United States); 21-23 Oct 1991. Order Number DE92011883. Source: OSTI; NTIS; INIS; GPO Dep.

This document contains an overview of the participating DOE Laboratory beam line interests and the projected science to be addressed on these beam lines, both at new and existing synchrotron facilities. The scientific programs associated with present and planned synchrotron research by DOE Laboratories are discussed in chapters titled "VUV and Soft X-Ray Research" and "Hard X-Ray Research." This research encompasses a broad range of the nation's scientific and technical research needs from fundamental to applied, in areas including environmental, biological, and physical sciences; new materials; and energy-related technologies. The projected cost of this proposed construction has been provided in tabular form using a uniform format so that anticipated DOE and outside funding agency contributions for construction and for research and development can be determined. The cost figures are, of course, subject to uncertainties of detailed design requirements and the availability of facility-designed generic components and outside vendors. The report also contains a compendium (as submitted by the beam line proposers) of the design capabilities, the anticipated costs, and the scientific programs of projected beam line construction at the four synchrotron facilities. A summary of the projected cost of these beam lines to be requested of DOE is compiled.

20301 (CONF-9110359–1) **High-resolution imaging in the scanning transmission electron microscope.** Pennycook, S.J.; Jesson, D.E. Oak Ridge National Lab., TN (United States). Mar 1992. 31p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. From International school on electron microscopy in materials science; Brindisi (Italy); 7-11 Oct 1991. Order Number DE92010647. Source: OSTI; NTIS; INIS; GPO Dep.

The high-resolution imaging of crystalline materials in the scanning transmission electron microscopy (STEM) is reviewed with particular emphasis on the conditions under which an incoherent image can be obtained. It is shown that a high-angle annular detector can be used to break the coherence of the imaging process, in the transverse plane through the geometry of the detector, or in three dimensions if multiphonon diffuse scattering is detected. In the latter case, each atom can be treated as a highly independent source of high-angle scattering. The most effective fast electron states are therefore tightly bound s-type Bloch states. Furthermore, they add constructively for each incident angle in the coherent STEM probe, so that s states are responsible for practically the entire image contrast. Dynamical effects are largely removed, and almost perfect incoherent imaging is achieved. s states are relatively insensitive to neighboring strings, so that incoherent imaging is maintained for superlattice and interfaces, and supercell calculations are unnecessary. With an optimum probe profile, the incoherent image represents a direct image of the crystal projection, with compositional sensitivity built in through the strong dependence of the scattering cross sections on atomic number Z.

20302 (HMI-B–493) **Neutron scattering-instrumentation at the upgraded research reactor BER II. Berlin Neutron Scattering Center - BENSC, October 1991.** Hahn-Meitner-Institut Berlin GmbH (Germany). 1991. 52p. Order Number DE92517034. Source: OSTI; NTIS (US Sales Only); INIS.

The Berlin Neutron Scattering Centre (BENSC) is a newly created special department of the Hahn-Meitner-Institut, in the framework of which the BER II neutron beam reactor is made available to external users. BENSC is devoted to development, continuous modernisation and maintenance of the scientific instrumets at the BER II and to the support of their users. (orig./HSI).

20303 (INIS-mf–13178, pp. 121-137) **Concepts, techniques and applications of point-contact spectroscopy.** Raychaudhuri, A.K. (Indian Inst. of Science, Bangalore (India). Dept. of Physics). Department of Atomic Energy, Bombay (India). Board of Research in Nuclear Sciences. 1991. 269p. (CONF-9101139–: Solid state physics symposium, Bombay (India), 1-4 Jan 1991). In *Proceedings of the solid state physics symposium: Combined Vol. 32A and Vol. 33A: Invited talks.* Order Number DE92001361. Source: OSTI; NTIS (US Sales Only); INIS.

Point-contact spectroscopy is a powerful tool to study spectrum of elementary excitations in solid. In the past decade this particular form of spectroscopy has been applied to a number of well defined problems in solid state physics, like, studies of phonons, magnetic excitations, internal field in spin glasses, heavy fermion systems etc. In recent years this technique is being widely used to search for superconducting energy gap in high Tc materials. The basic physical concepts behind such experiments are stated and techniques and representative results are discussed. In particular recent results obtained on normal and superconducting oxides with a point-contact apparatus working in a field upto 8 Tesla and down to a temperature 1.5 K are discussed. It is shown how such point contact set up can be used to make ultralow capacitance tunnel junction ($\approx 10^{-18}$-10^{-19}Farad) so that interesting phenomena like single electron tunneling can be observed. (author). 19 refs., 5 figs.

20304 (INIS-mf–13178, pp. 138-150) **X-ray studies on protein structures.** Ramanadham, M. (Bhabha Atomic Research Centre, Bombay (India). Solid State Physics Div.). Department of Atomic Energy, Bombay (India). Board of Research in Nuclear Sciences. 1991. 269p. (CONF-9101139–: Solid state physics symposium, Bombay (India), 1-4 Jan 1991). In *Proceedings of the solid state physics symposium: Combined Vol. 32A and Vol. 33A: Invited talks.* Order Number DE92001361. Source: OSTI; NTIS (US Sales Only); INIS.

Proteins are involved practically at every stage of biological organization and interactions. X-ray diffraction studies on protein structures are aimed at understanding and interpreting a vast majority of biological phenomena at molecular level. This subject, initiated during the second quarter of this century, has played a pivotal role in enhancing knowledge of the life processes, such as the enzyme activity, control and expression of genetic information, immune response and others. Thanks to the improved techniques of sample preparation, availability of high-intensity X-ray sources, fast digital computers with larger memories and interactive graphics systems, many new methods of structure analysis and interpretation are being attempted, and more and more complex biomolecular systems are being investigated in recent years. A reinvestigation of the phase problem, optimization of molecular models by augmenting the diffraction data with other extra-crystallographic information (energy and geometry restraints, etc.); the use of real-time graphics techniques for model interpretation and editing, etc., are some of the recent developments that need special mention. (author). 37 refs.

20305 (INIS-mf--13192, pp. 29-30) **Application of Moessbauer spectroscopy in technical practice.** Sitek, J. (Slovenska Vysoka Skola Technicka, Bratislava (Czechoslovakia). Elektrotechnicka Fakulta); Lipka, J. Jednota Ceskoslovenskych Matematiku a Fyziku, Prague (Czechoslovakia). 1991. 319p. (In Slovak). The Moessbauer effect - mostly on ^{57}Fe nuclei - proves to be a powerful tool for the phase analysis of alloys and other materials, e.g. mineral systems. The potential of both qualitative and quantitative Moessbauer phase analysis is demonstrated on examples of steels and soft magnetic alloys and briefly compared with other methods. 20321 (KEK-PROC–91-9) **Proceedings of the workshop on scattering experiments under extreme conditions.** Sakai, N. (Institute of Physical and Chemical Research, Wako, Saitama (Japan)); Ikeda, H.; Ando, M. (eds.). National Lab. for High Energy Physics, Tsukuba, Ibaraki (Japan). Oct 1991. 143p. (In Japanese). (CONF-9010489–: Workshop on scattering experiments under extreme conditions, Tsukuba (Japan), 12-13 Oct 1990). Order Number DE92515058. Source: OSTI; NTIS (US Sales Only); INIS.

In the National Laboratory for High Energy Physics (KEK), as the research facilities, there are Photon Factory, the facility for utilizing the booster and University of Tokyo Meson Science Research Center. For the research on physical properties, it is very important to do structural analysis in a broad sense and to observe the behavior of quasiparticles in solids. The X-ray and pulsed neutrons required for these researches can be obtained in a single laboratory in KEK, and it is rare in the world. At this opportunity of the workshop on scattering experiments under extreme conditions, it is hoped that the positive interchange between both PF and booster groups will be carried out. The research on magnetic substances using X-ray is a most noteworthy utilization of synchrotron radiation. The discovery of X-ray resonance magnetic scattering by K. Namikawa is one of the remarkable researches using synchrotron radiation in the world. When the extreme conditions around samples are prepared, the quality of signals for the research on physical properties is to be heightened. In this report, the researches on physical properties under ultrahigh pressure and ultralow temperature are reported. (K.I.).

20322 (KIYaI–89-34) **The neutron localization at magnetic field nonuniformities in superconductors.** Rud'ko, V.N.; Sugakov, V.I.; Shevtsova-Kaz'mirchuk, O.N. AN Ukrainskoj SSR, Kiev (Ukraine). Inst. Yadernykh Issledovanij. 1989. 11p. (In Russian). Order Number DE92627517. Source: OSTI; NTIS (US Sales Only); INIS.

The possibility of existence of the neutron surface states at the interface of a superconductor and a normal metal (or insulator) placed in the magnetic field is investigated. It is shown that in the superconducting lanthanum ceramics at the boundaries of superconducting and insulator phases in the magnetic field close to B_{c1} the surface states of neutrons exist. The possibility of neutron channeling along the flux line in the mixed state superconductor is studied. 16 refs.; 2 figs.

20323 (KIYaI–90-16) **Method of slow neutrons inelastic scattering in investigations of crystal electric field effects.** Vasil'kevich, A.A.; Ivanitskij, P.G.; Krotenko, V.T.; Majstrenko, A.N.; Slisenko, V.I. AN Ukrainskoj SSR, Kiev (Ukraine). Inst. Yadernykh Issledovanij. 1990. 17p. (In Russian). Order Number DE92627518. Source: OSTI; NTIS (US Sales Only); INIS.

The procedure of investigations of crystal electric field (CEF) effects by the method of slow neutron inelastic scattering has been described. The results are presented on determination of Hamiltonian parameters of CEF for compound of Ce_3Al_{11} by the given method. The scheme of levels of the main multiplet $_3H^4$ of Ce^{3+} ion in the investigated compound is reduced and the magnetic part of specific heat (Schottky specific heat) depending on the temperature. 14 refs.; 3 figs.; 1 tab.

20324 (LNS–161) **Neutron scattering (progress report) January - December 1991.** Buehrer, W. (Paul Scherrer Inst. (PSI), Villigen (Switzerland)); Fischer, P.; Furrer, A. (eds.). Eidgenoessische Technische Hochschule, Zuerich (Switzerland). Lab. fuer Neutronenstreuung. Feb 1992. 171p. (In German, English). Order Number DE92627519. Source: OSTI; NTIS (US Sales Only); INIS.

Progress made by the Laboratory for Neutron Scattering of the Swiss Federal Institute of Technology during the year 1991 in the fields of high-T_c superconductors, materials science, magnetism, structural research, lattice dynamics, phase transitions, instrumental and support activities is reported. figs., tabs., refs.

20325 (NEI-DK–836) **Risoe activity within the CEC SOFC programme: Measurement of internal stresses by neutron diffraction.** Toftegaard, H.; Leffers, T.; Poulsen, F.W. Risoe National Lab., Roskilde (Denmark). Materials Dept. Oct 1991 14p. Contract EN3E-0178-DK. Order Number DE92628746. Source: OSTI; NTIS (US Sales Only); INIS.

The objective was to design, fabricate and test a neutron diffraction equipment for measurements of internal stresses in SOFC components with high spatial resolution, and use the best suited equipment to measure internal stresses in SOFC components from other participants in the programme. Two different geometries and two different materials (Al_2O_x and YSZ) were examined in order to investigate: the diffracted intensity as related to the diffracting volume, the diffracted intensity as related to the position of the sample relative to the slit arrangement, and the accuracy of the strain measurement. It was found that the beam collimation by two pairs of double slits increases and the diffraction efficiency decreases with decreased slit width, the diffracting volume is fairly well defined by the two pairs of double slits, and the accuracy in the determination of the internal stresses is adequate. With the equipment for high spatial resolution it is possible to measure lattice spacing in volumes of YSZ down to 1-10 mm^3. Residual strains were measured for NiO, LSM and YSZ of a planar Risoe 3-layer cell (anode NiO/YSZ, electrode YSZ, cathode LMS/YSZ). Each layer was 42 by 42 by 0.1 mm. Slit widths from 10 to 20 mm were used. The best suited equipment was a combination of Soller slits (thin, neutron absorbing, parallel plates) and a double slit for both the incident and the diffracted beam. The measured residual strains for the components of the cell are: $300x10^{-6}$ (tension) for NiO, $700x10^{-6}$ (tension) for LSM and less than $450x10^{-6}$ (compression) for YSZ. (AB).

20326 (RAL–91-096) **Detection of quadrupole interactions by muon level crossing resonance.** Cox, S.F.J. Rutherford Appleton Lab., Chilton (United Kingdom). Dec 1991. 17p. (CONF-910776–: 11. international symposium on nuclear quadrupole resonance spectroscopy (ISNQRS-11), London (United Kingdom), 15-19 Jul 1991). Order Number DE92627520. Source: OSTI; NTIS (US Sales Only); INIS.

To be published in Zeitschrift fuer Naturforschung.

The positive muon proves to be a very versatile and sensitive magnetic resonance probe: implanted in virtually any material its polarisation may be monitored via the asymmetry in its radioactive decay, giving information on the sites occupied by the muon in lattices or molecules, and the local fields experienced at these sites. The scope of these experiments has been greatly extended by the development of a technique of cross relaxation or level crossing resonance which allows quadrupole splittings on nuclei adjacent to the muon to be measured. The principles of the technique, and the conditions necessary for detection of the spectra, are described, together with a number of applications. Studies of the muon level crossing resonance in copper have given valuable information on the crystallographic site, electronic structure and low temperature mobility of the interstitial defect. In semiconductors, muons are expected to trap at other impurities -notably acceptors - in processes analogous to the passivation of dopants by hydrogen. Muons implanted in ice produce a significant change in the quadrupole coupling constant of adjacent ^{17}O nuclei which may be traced to the effects of the large muon zero point energy; the resonance spectrum also exhibits temperature dependent features which may be informative on the nature and lifetime of defects in the ice structure. Muon level crossing resonance has already been studied in an oxide superconductor and this relatively young field is now wide open for quadrupole interaction studies in other materials, using a variety of nuclei. (author).

Article commissioned for the Encyclopaedia of Materials Science and Engineering.

The positive muon provides a remarkable spectroscopic probe of the solid state. Implanted in virtually any material, its spin polarisation may be monitored to define the sites it occupies in lattices or molecules and to report on local structure and dynamics. Wide ranging applications in solid state science are illustrated in this article by examples in magnetics, chemistry and quantum diffusion. Primarily, the muon is a sensitive microscopic magnetometer: this elementary particle has spin 1/2 and a magnetic moment about three times that of the proton. The frequencies of its resonance or precession signals provide a direct and accurate measurement of local magnetic or hyperfine fields. Its relaxation functions characterise the distribution in space or the fluctuation in time of these fields. The muon is rarely a passive probe, however, since it represents a defect carrying unit positive charge. In fact its interactions with the local environment are commonly the main focus of interest; studies of this most fundamental of defects have eliminated complacency in several areas. The interactions, chemical and elastic, are essentially identical with those of the proton, so that their study is invaluable in situations where hydrogen cannot be detected by conventional spectroscopies. Alternatively, when muon and proton behaviour may be compared, the comparison reveals a variety of kinetic and dynamic isotope effects: the muon has about one ninth the proton mass. This order of magnitude ratio greatly facilitates identification of specifically quantum effects, ie those including zero point energy or tunnelling. (author).

20328 (RAL–92-014) **Geometric (Berry) phases in neutron molecular spectroscopy.** Lovesey, S.W. Rutherford Appleton Lab., Chilton (United Kingdom). Feb 1992. 11p. Order Number DE92628748. Source: OSTI; NTIS (US Sales Only); INIS.

A theory of neutron scattering by nuclei in a molecule, accompanied by an electronic transition, is formulated with attention to gauge potentials and geometric phases in the Born-Oppenheimer scheme. Non-degenerate and nearly degenerate electronic levels are considered. For nearly degenerate levels it is shown that, the cross-section is free of the singular structure which characterizes the corresponding gauge potential for the phase, and much larger than for well separated electronic states. (author).

6653 Interactions Between Beams and Condensed Matter

20329 (DOE/ER/45208–7) **He atom-surface scattering: Surface dynamics of insulators, overlayers and crystal growth: Progress report, May 1, 1991–Aprill 30, 1992.** Florida State Univ., Tallahassee, FL (United States). [1992]. 37p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG05-85ER45208. Order Number DE92011810. Source: OSTI; NTIS; INIS; GPO Dep.

Investigations in this laboratory have focused on the surface structure and dynamics of ionic insulators and on epitaxial growth onto alkali halide crystals. In the later the homoepitaxial growth of NaCl/NaCl(001) and the heteroepitaxial growth of KBr/NaCl(001), NaCl/KBr(001) and KBr/RbCl(001) have been studied by monitoring the specular He scattering as a function of the coverage and by measuring the angular and energy distributions of the scattered He atoms. These data provide information on the surface structure, defect densities, island sizes and surface strain during the layer-by-layer growth. The temperature dependence of these measurements also provides information on the mobilities of the admolecules. He atom scattering is unique among surface probes because the low-energy, inert atoms are sensitive only to the electronic structure of the topmost surface layer and are equally applicable to all crystalline materials. It is proposed for the next year to exploit further the variety of combinations possible with the alkali halides in order to carry out a definitive study of epitaxial growth in the ionic insulators. The work completed so far, including measurements of the Bragg diffraction and surface dispersion at various stages of growth, appears to be exceptionally rich in detail, which is particularly promising for theoretical modeling. In addition, because epitaxial growth conditions over a wide range of lattice mismatches is possible with these materials, size effects in growth processes can be explored in great depth. Further, as some of the alkali halides have the CsCl structure instead of the NaCl structure, we can investigate the effects of the heteroepitaxy with materials having different lattice preferences. Finally, by using co-deposition of different alkali halides, one can investigate the formation and stability of alloys and even alkali halide superlattices.

20330 (INIS-mf–13192 p5-p8) **Ion implantation.** Antoncik, E. (Aarhus Univ. (Denmark). Inst. of Physics). Jednota Ceskoslovenskych Matematiku a Fyziku, Prague (Czechoslovakia). 1991. 319p. (In Czech). (CONF-9008243–: 10. conference of Czechoslovak physicists, Brno (Czechoslovakia), 27-31 Aug 1990). In *The tenth conference of Czechoslovak physicists.* Order Number DE92628439. Source: OSTI; NTIS (US Sales Only); INIS.

The principles of the ion implantation technique are outlined. The apparently anomalous behavior of some implanted ions in silicon during annealing is discussed. The unusual diffusion behavior of boron atoms in silicon in dependence on the duration of the annealing process is demonstrated, as is the dependence of the formation of acceptors on the annealing time. (Z.S.). 2 figs.

20331 (INIS-SU–309/A, pp. 113-126) **State-of-the-art and trends of developement of semiconductor radiation physics.** Mordkovich, V.N.; Shakhovtsev, V.I. AN Ukrainskoj SSR, Kharkov (Ukraine). Fiziko-Tekhnicheskij Inst. 1990. 227p. (In Russian). (CONF-9005247–: International conference on radiation material science, Alushta (USSR), 22-25 May 1990). In *Radiation materials science. V. 4.* Order Number DE92001357. Source: OSTI; NTIS (US Sales Only); INIS.

The state of theories describing fundamental properties of primary radiation defects (RD) in diamond-like semiconductors as well as their interaction with impurities and with one another, giving rise to secondary RD are analyzed. Effectiveness of formation of secondary RD are evaluated. Boundaries of applicability of methods of doping with various impurities for controlling RD formation and accumulation processes are estimated. New data on the effect of thermal defects (TD) on the RD behaviour demonstrate that mechanisms of interaction of the latter with TD and with 'chemical' donors are basically different. 31 refs.; 9 figs.

20332 (INIS-SU--309/A, pp. 149-155) **On the initial radiation-induced defect lifetime in silicon.** Krajchinskij, A.N. (AN Ukrainskoj SSR, Kiev (Ukraine). Inst. Fiziki); Ostashko, N.I. AN Ukrainskoj SSR, Kharkov (Ukraine). Fiziko-Tekhnicheskij Inst. 1990. 227p. (In Russian). (CONF-9005247--: International conference on radiation material science, Alushta (USSR), 22-25 May 1990). In *Radiation materials science. V. 4.* Order Number DE92001357. Source: OSTI; NTIS (US Sales Only); INIS.

An attempt was made to determine some parameters of movement of vacancies and interstitials under silicon crystal irradiation by high-power electron pulses. Irradiation of n-type silicon samples doped with phosphorus was conducted by 3 MeV electron single pulses with 3.7 ms duration. Relaxation of nonequilibrium conductivity induced by electron pulse was measured. It is shown that diffusion coefficients of vacancy and interstitial exceed similar equilibrium values by several orders at room temperature under conditions of strong ionization of electron subsystem of silicon crystals. 7 refs.; 4 figs.

20333 (LA-UR--92-792) **X-ray streak camera diagnostics of picosecond laser-plasma interactions.** Cobble, J.A.; Fulton, R.D.; Jones, L.A.; Kyrala, G.A.; Schappert, G.T.; Taylor, A.J.; Wahlin, E.K. Los Alamos National Lab., NM (United States). [1992]. 10p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-920362--14: 9. topical conference on high-temperature plasma diagnostics, Santa Fe, NM (United States), 15-19 Mar 1992). Order Number DE92011371. Source: OSTI; NTIS; INIS; GPO Dep.

An x-ray streak camera is used to diagnose a laser-produced Al plasma with time resolution of ~10 ps. A streak record of filtered emission and a time-integrated transmission grating spectrum reveal that the plasma radiation is dominated by emission from He- and H-like resonance lines. 11 refs.

20334 (LA-UR--92-989) **Laser-ablation processes.** Dingus, R.S. Los Alamos National Lab., NM (United States). [1992]. 8p. Sponsored by USDOE, Washington, DC (United States); Department of Defense, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-920124--19: Society of Photo-Optical Instrumentation Engineers' international symposium on laser spectroscopy as part of SPIE's symposium on optics, electro-optics and laser applications in science and engineering, Los Angeles, CA (United States), 1 Order Number DE92011226. Source: OSTI; NTIS; GPO Dep.

The various mechanisms by which ablation of materials can be induced with lasers are discussed in this paper. The various ablation processes and potential applications are reviewed from the threshold for ablation up to fluxes of about 10^{13} W/cm^2, with emphasis on three particular processes; namely, front-surface spallation, two-dimensional blowoff, and contained vaporization.

20335 (RISO-R--591) **Erosion of volatile elemental condensed gases by keV electron and light-ion bombardment.** Schou, J. Risoe National Lab., Roskilde (Denmark). Physics Dept. Nov 1991. 159p. Order Number DE92628753. Source: OSTI; NTIS (US Sales Only); INIS.

Erosion of the most volatile elemental gases by keV electron and light-ion bombardment has been studied at the experimental setup at Risoe. The present work includes frozen neon, argon, krypton, nitrogen, oxygen and three hydrogen isotopes, deuterium, hydrogen deuteride and hydrogen. The yield of these condensed gases has been measured as a function of film thickness and primary energy for almost all combinations of primary particles (1-3 keV electrons, 5-10 keV hydrogen- and helium ions) and ices. These and other existing results show that there are substantial common features for the sputtering of frozen elemental gases. Within the two groups, the solid rare gases and the solid molecular gases, the similarity is striking. The hydrogenic solids deviate in some respects from the other elements. The processes that liberate kinetic energy for the particle ejection in sputtering are characteristic of the specific gas. (au) 3 tabs., 12 ills., 159 refs.

20336 (UCRL-JC--109627) **Photon absorption and the decay of surface excitation on sapphire $(11\bar{2}0)$-(3 × 1).** Hamza, A.V.; Hughes, R.S. Jr.; Chase, L.L.; Lee, H.W.H. Lawrence Livermore National Lab., CA (United States). Oct 1991. 9p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-911064--9: SPIE International Society for Optical Engineering meeting, Boulder, CO (United States), 23-25 Oct 1991). Order Number DE92011533. Source: OSTI; NTIS; GPO Dep.

A laser-based two-pulse correlation technique is used to investigate the mechanisms of photon absorption and the decay of surface excitation on Al_2O_3(1120). The mechanism for emission of positive or neutral particles depends on the wavelength and/or pulsewidth. In our previous study for a pulsewidth of 80 picoseconds at 1064 nm the lifetime of the surface excitation leading to detectable emission and further to optical surface damage was measured to be ~200 picoseconds. However, for 800 femtosecond pulses at 616 nm the measured lifetime is a few nanoseconds. In both cases a low-order absorption process is indicated.

20337 (UCRL-JC--110159) **Laser-induced desorption from sapphire surfaces.** Hamza, A.V.; Schildbach, M.A. Lawrence Livermore National Lab., CA (United States). Mar 1992. 4p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-920462--1: Workshop on disabsorption induced by electronic transitions, Taos, NM (United States), 1-4 Apr 1992). Order Number DE92012698. Source: OSTI; NTIS; GPO Dep.

Laser-induced desorption of energetic (~7eV) aluminum ions was observed from clean and water-covered sapphire (1102) surfaces using time-of-flight mass spectrometry with laser wavelengths of 1064, 355, and 266 nm. In sharp contrast, O^+ (H^+ and OH^+) ions were observed in electron-induced desorption measurements with 300 eV electrons from the bare (water- covered) (1102) surface. Sapphire surfaces were characterized with low energy electron diffraction, reflection electron energy loss spectroscopy, and Auger electron spectroscopy. 8 refs.

20338 (ANL/ESD/TM--27) **Potential impact of high temperature superconductors on maglev transportation.** Hull, J.R. Argonne National Lab., IL (United States). Energy Systems Div. Feb 1992. 21p. Sponsored by Department of Defense, Washington, DC (United States). DOE Contract W-31109-ENG-38. Order Number DE92012683. Source: OSTI; NTIS; GPO Dep.

This report describes the potential impact that high-temperature superconductors (HTSs) may have on transportation by magnetically levitated vehicles. It is not intended as a planning document, but rather as an overview of potential HTS applications to magnetic-levitation (maglev) transportation. The present maglev program in the United States is summarized, and the present status of development of HTSs is described. Areas identified for possible impact on maglev technology are (1) liquid-nitrogen-cooled levitation magnets, (2) magnetic-field shielding of the passenger compartment, (3) superconducting magnetic energy storage for wayside power, (4) superconducting bearings for flywheel energy storage for wayside power, (5) downleads to continuously powered liquid-helium-cooled levitation magnets, and (6) liquid-hydrogen-cooled levitation magnets and linear motor propulsion windings. Major technical issues that remain to be resolved for the use of HTSs in maglev applications include thermal magnetic stability, mechanical properties, and critical current density at liquid-nitrogen temperatures.

20339 (INIS-mf–13178, pp. 163-186) **Positron annihilation studies on high temperature superconductors.** Sundar, C.S. (Indira Gandhi Centre for Atomic Research, Kalpakkam (India). Materials Science Div.); Bharathi, A. Department of Atomic Energy, Bombay (India). Board of Research in Nuclear Sciences. 1991. 269p. (CONF-9101139–: Solid state physics symposium, Bombay (India), 1-4 Jan 1991). In *Proceedings of the solid state physics symposium: Combined Vol. 32A and Vol. 33A: Invited talks.* Order Number DE92001361. Source: OSTI; NTIS (US Sales Only); INIS.

The results of positron annihilation measurements as a function of temperature, across Tc, in a variety of high temperature superconductors such as Y-Ba-Cu-O (Y1237), Y-Ba-Cu-O (Y1248), Bi-Sr-Ca-Cu-O, Tl-Ba-Ca-Cu-O, Ba-K-Bi-O and Nd-Ce-Cu-O are presented. It is shown that the variation of annihilation parameters in the superconducting state is correlated with the diposition of the positron density distribution with respect to the superconducting CuO planes. An increase in positron lifetime is observed below Tc when the positrons probe the CuO planes whereas a decrease in lifetime is observed when the positron density overlaps predominantly with the apical oxygen atom. With this correlation, the different temperature variation of annihilation parameters, seen in the various high temperature superconductors, is understood in terms of a local charge transfer from the planar oxygen atom to the apical oxygen atom. The significance of these results in the context of various theoretical models of high temperature superconductivity is discussed. In addition, the application of positron annihilation spectroscopy to the study of oxygen defects in the Y-Ba-Cu-O, Bi-Sr-Ca-Cu-O and Nd-Ce-Cu-O is presented. (author). 53 refs., 17 figs., 2 tabs.

20340 (INIS-mf–13178, pp. 187-202) **Josephson tunneling studies in high Tc superconductors.** Gupta, A.K. (National Physical Lab., New Delhi (India)). Department of Atomic Energy, Bombay (India). Board of Research in Nuclear Sciences. 1991. 269p. (CONF-9101139–: Solid state physics symposium, Bombay (India), 1-4 Jan 1991). In *Proceedings of the solid state physics symposium: Combined Vol. 32A and Vol. 33A: Invited talks.* Order Number DE92001361. Source: OSTI; NTIS (US Sales Only); INIS.

The work done on Josephson tunneling in high temperature superconductors is reviewed. Fabrication and performance of SQUIDS and other Josephson junction devices are described. (author). 102 refs., 15 figs.

20341 (INIS-mf–13178, pp. 203-227) **Superconductivity in strongly correlated systems with local electron-phonon interaction.** Das, A.N. (Saha Institute of Nuclear Physics, Calcutta (India)). Department of Atomic Energy, Bombay (India). Board of Research in Nuclear Sciences. 1991. 269p. (CONF-9101139–: Solid state physics symposium, Bombay (India), 1-4 Jan 1991). In *Proceedings of the solid state physics symposium: Combined Vol. 32A and Vol. 33A: Invited talks.* Order Number DE92001361. Source: OSTI; NTIS (US Sales Only); INIS.

The study of the strongly correlated system has gained a lot of interest after the discovery of the high-Tc oxide systems. Recent experiments point out the importance of local electron-phonon interaction in the high-Tc systems and possibility of polaron formation. In view of the above, an effective hamiltonian, which results from the Hubbard model with strong on-site Coulomb interaction and in presence of local electron-phonon coupling, is studied using the Gutzwiller approximation (GA) and the X-operator technique for the extended s- and d-wave superconductivity in an anisotropic 3-dimensional system. A comparison of the results obtained by the GA and the X-operator technique points out that the latter approximation, which preserves the local constraints, is more appropriate to study superconductivity in strongly correlated systems. The X-operator technique predicts the s-wave superconductivity for both low and high hole concentrations whereas the d-wave superconductivity is stable in the intermediate hole concentration region. Here the hole concentration is measured in excess to the undoped material having one electron (or hole) per site (n=1). Tc for the s-wave is higher for a nearly empty band than for an almost half-filled band. The anisotropy in the hopping and pairing interaction has more effect on the s- than on the d-wave superconductivity. For low as well as for high hole concentration, i.e. for n $\approx$1 and n $\approx$0, the superconducting transition temperature Tc for the s-wave pairing decreases as the inter-planar coupling increases. The effective mass of the polarons, determined using the two-phonon coherent state for the phonon subsystem, is very high for low as well as for high hole concentrations. For the intermediate hole concentration the effective mass is much lower compared to the low-filling case. The implication for high-Tc superconductors are discussed. (author). 50 refs., 8 figs.

20342 (INIS-mf–13192, pp. 27-28) **Study of high-T_C superconductors and amorphous materials by positron annihilation.** Kristiak, J. (Slovenska Akademia Vied, Bratislava (Czechoslovakia). Fyzikalny Ustav). Jednota Ceskoslovenskych Matematiku a Fyziku, Prague (Czechoslovakia). 1991. 319p. (In Slovak). (CONF-9008243–: 10. conference of Czechoslovak physicists, Brno (Czechoslovakia), 27-31 Aug 1990). In *The tenth conference of Czechoslovak physicists.* Order Number DE92628439. Source: OSTI; NTIS (US Sales Only); INIS.

Two methods of annihilation investigation, viz., measurement of the positron lifetimes and measurement of the Doppler broadening of the annihilation line, were applied to the study of properties of high-temperature superconductors and amorphous metals. The former method provides information on the electron density and/or capture centres (defects), whereas the latter method gives information on the electron momentum distribution through the material. The high-temperature superconductors were of the $YBa_2Cu_3O_{7-x}$ type, the amorphous metallic materials were of the $Fe_{80-x}Ni_xB_{20}$ type (x = 10, 20, 30, 40). The results demonstrate that for these kinds of materials the positron annihilation techniques can provide sufficient information on the behavior of electrons in the substances and also on some structural changes. (Z.S.). 2 refs.

20343 (INIS-mf–13192, pp. 67) **Strongly correlated fermions and high-T_C superconductivity.** Hudak, O. (Slovenska Akademia Vied, Kosice (Czechoslovakia). Ustav Experimentalnej Fyziky). Jednota Ceskoslovenskych Matematiku a Fyziku, Prague (Czechoslovakia). 1991. 319p. (In Slovak). (CONF-9008243–: 10. conference of Czechoslovak physicists, Brno (Czechoslovakia), 27-31 Aug 1990). In *The tenth conference of Czechoslovak physicists.* Order Number DE92628439. Source: OSTI; NTIS (US Sales Only); INIS.

The phase diagram of a material exhibiting high-temperature superconductivity is complex. The persisting problems are discussed of condensed systems which hinder the development of an adequate theoretical description of that diagram. These include the particularly insufficient insight into systems of fermions with a strong correlation and with a link to additional degrees of freedom. Among the simplest models describing such situations are Hubbard's model, the periodical Anderson's model and the t-J model. (Z.S.). 2 refs.

20344 (INIS-mf–13192, pp. 179-180) **Rare earths related phenomena in high-T_C superconductors.** Nekvasil, V. (Ceskoslovenska Akademie Ved, Prague (Czechoslovakia). Fyzikalni Ustav). Jednota Ceskoslovenskych Matematiku a Fyziku, Prague (Czechoslovakia). 1991. 319p. (CONF-9008243–: 10. conference of Czechoslovak physicists, Brno (Czechoslovakia), 27-31 Aug 1990). In *The tenth conference of Czechoslovak physicists.* Order Number DE92628439. Source: OSTI; NTIS (US Sales Only); INIS.

Many compounds belonging to the new class of the perovskite-like copper oxides contain magnetic rare earth (RE) ions. The study of the crystal field, which splits the energy levels of 4f electrons of these ions and thus partially "quenches" their magnetic moments, is believed to help to monitor charge redistributions in the CuO_2 planes and thus to elucidate the nature of the high-T_C superconductivity in these materials. The results are presented of crystal field studies in $REBa_2Cu_3O_{7-x}$ and the Nd_2CuO_4-type compounds, where the charge carriers are holes and electrons, respectively. The relation between the crystal field and superconductivity is discussed. (Z.S.). 2 figs., 8 refs.

20345 (INIS-mf–13192, pp. 209-210) **Superconducting magnets for 200-400 MHz high-resolution NMR spectroscopy.** Jelinek, J. (Ceskoslovenska Akademie Ved, Brno (Czechoslovakia). Ustav Pristrovoje Techniky). Jednota Ceskoslovenskych Matematiku a Fyziku, Prague (Czechoslovakia). 1991. 319p. (In Czech). (CONF-9008243–: 10. conference of Czechoslovak physicists, Brno (Czechoslovakia), 27-31 Aug 1990). In *The tenth conference of Czechoslovak physicists*. Order Number DE92628439. Source: OSTI; NTIS (US Sales Only); INIS.

Designs are described for the magnet of a 400 MHz spectrometer (induction 9.4 T), for which the fairly stable NbTi multifilamental superconductors (50 to 100 filaments in a Cu matrix) are still suited. The superconductor diameter in the sections is varied, e.g. from 0.5 to 0.8 mm, so that the current density should be adapted to the local field. A method of combining the multifilamental NbTi superconductors (junction resistance 10^{-11} to 10^{-14} ohm) was developed for attaining stability in time. Simultaneously with the 400 MHz magnet for a high resolution spectrometer, a 200 MHz magnet for NMR tomography, for in vivo spectrometry of small biological objects, etc., is being designed. (Z.S.). 2 figs.

20346 (IS-T–1580) **Neutron diffraction study of the electronic structure of high-$T_c$superconductor-related compounds.** Wang, Xun-Li. Ames Lab., IA (United States). 16 Mar 1992. 161p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-82. Order Number DE92012587. Source: OSTI; NTIS; INIS; GPO Dep.

Neutron diffraction techniques have been used to study the electronic structure of La_2NiO_4 and $Sr_2CuO_2Cl_2$ by measuring the antiferromagnetic form factor of the single-crystal samples at 15 K. The antiferromagnetic form factor was obtained from the integrated intensities of several magnetic reflections. In both cases, the experimentally determined form factor exhibits a plateau at low Q values (up to 3 $Å^{-1}$), similar to that observed for La_2CuO_4. Detailed modeling of the experimental data of these three compounds suggests that the observed plateau may be accounted for by including the covalency effects in the Ni-O or Cu-O plane. The experimental data are also compared with spin-polarized band calculations.

20347 (ITF–90-54) **Theory of the fourth second in the relativistic system with the superfluidity.** Vil'chinskij, S.I.; Fomin, P.I. AN Ukrainskoj SSR, Kiev (Ukraine). Inst. Teoreticheskoj Fiziki. 1990. 12p. (In Russian). Order Number DE92627559. Source: OSTI; NTIS (US Sales Only); INIS.

The equations describing the propagation of the fourth sound in the relativistic theory of the superfluidity are derived. The expression for the velocity of the fourth sound is obtained. In the nonrelativistic limit it coincides with the corresponding expression in the theory of the superfluid helium. 7 refs.

20348 (ITP–89-28) **Interpretation of the T-H phase diagram of HTSC in the frame of superconductive granular layer model.** Burgij, A.I.; Shadura, V.N. AN Ukrainskoj SSR, Kiev (Ukraine). Inst. Teoreticheskoj Fiziki. 1989. 20p. Order Number DE92627560. Source: OSTI; NTIS (US Sales Only); INIS.

The model of two-dimensional Coulomb gas on charge substrate is used to describe magnetic properties of high temperature superconductor LaBaCuO. The phase transition from the nonergodic superconducting state to the ergodic one is associated with the melting of Wigner's two-dimensional crystal into the liquid crystal-hexatic, and the phase transition from ergodic superconducting state to the normal one - with the melting of liquid crystal. The T_c(H) dependence calculated within these concepts is consistent with that observed in experiment. 22 refs.; 3 figs.

20349 (LA-UR–92-922) **Proceedings, phenomenology and applications of high temperature superconductors.** Bedell, K.S. Los Alamos National Lab., NM (United States). [1991]. 527p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-9108140–: Phenomenology and applications of high temperature superconductivity, Los Alamos, NM (United States), 22-24 Aug 1991). Order Number DE92011133. Source: OSTI; NTIS; INIS; GPO Dep.

Phenomenology and Applications of High Temperature Superconductors, The Los Alamos Symposium: 1991, was sponsored by the Los Alamos National Laboratory, Center for Materials Science, the Advanced Studies Program on High Temperature Superconductivity Theory (ASP) and the Exploratory Research and Development Center. This is the second symposium in the series. High Temperature Superconductivity, The Los Alamos Symposium: 1989, also published by Addison Wesley, focused on the cutting-edge theoretical and experimental issues in high temperature superconductors. This symposium, with its focus on the phenomenology and applications of high temperature superconductors, gives a complementary review of the aspects of the field closely related to the impact of high temperature superconductors on technology. The objective of ASP is to advance the field on a broad front with no specific point of view by bringing a team of leading academic theorists into a joint effort with the theoretical and experimental scientists of a major DOE national laboratory. The ASP consisted of fellows led by Robert Schrieffer (UCSB and now FSU) joined by David Pines (University of illinois), Elihu Abrahams (Rutgers), Sebastian Doniach (Stanford), and Maurice Rice (ETH, Zurich) and theoretical and experimental staff of Los Alamos National Laboratory. This synergism of academic, laboratory, theoretical and experimental research produced a level of interaction and excitement that would not be possible otherwise. This publication and the previous one in the series are just examples of how this approach to advancing science can achieve significant contributions.

665420 Superfluidity

20350 (INIS-mf–13192, pp. 203-206) **Observation of effects analogous to the Josephson effect on the spin flow in ^{3}He.** Makroczyova, V. (Slovenska Akademia Vied, Kosice (Czechoslovakia). Ustav Experimentalnej Fyziky). Jednota Ceskoslovenskych Matematiku a Fyziku, Prague (Czechoslovakia). 1991. 319p. (In Slovak). (CONF-9008243–: 10. conference of Czechoslovak physicists, Brno (Czechoslovakia), 27-31 Aug 1990). In *The tenth conference of Czechoslovak physicists*. Order Number DE92628439. Source: OSTI; NTIS (US Sales Only); INIS.

Phenomena which are referred to as the Josephson effects include, among others, effects associated with mass flows in ^{3}He. Theoretical as well as experimental results supported the assumption that the Josephson effect can also take place on spin superfluid flows in superfluid ^{3}He. Some experiments aimed at observating the Josephson effect on spin flows are described. (Z.S.). 4 figs., 10 refs.

(United States). Scientific Computing Staff. [1991]. DOE Contract AC05-84OR21400. From 1. energy research power supercomputer users symposium; Gaithersburg, MD (United States); 21-22 May 1991. In *Proceedings of the first energy research power supercomputer users symposium.* 173p. Order Number DE91018877. Source: OSTI; NTIS; INIS.

Although the single-particle picture of magnetic confinement is helpful in understanding some basic physics of plasma confinement, it does not give a full description. Collective effects dominate plasma behavior. Any analysis of plasma confinement requires a self-consistent treatment of the particles and fields. The general picture is further complicated because the plasma, in general, is turbulent. The study of fluid turbulence is a rather complex field by itself. In addition to the difficulties of classical fluid turbulence, plasma turbulence studies face the problems caused by the induced magnetic turbulence, which couples field by itself. In addition to the difficulties of classical fluid turbulence, plasma turbulence studies face the problems caused by the induced magnetic turbulence, which couples back to the fluid. Since the fluid is not a perfect conductor, this turbulence can lead to changes in the topology of the magnetic field structure, causing the magnetic field lines to wander radially. Because the plasma fluid flows along field lines, they carry the particles with them, and this enhances the losses caused by collisions. The changes in topology are critical for the plasma confinement. The study of plasma turbulence and the concomitant transport is a challenging problem. Because of the importance of solving the plasma turbulence problem for controlled thermonuclear research, the high complexity of the problem, and the necessity of attacking the problem with supercomputers, the study of plasma turbulence in magnetic confinement devices is a Grand Challenge problem.

20353 (CONF-9105202–, pp. 10, Paper 10) **Particle modeling of plasmas computational plasma physics.** Dawson, J.M. (Univ. of California, Los Angeles (United States)). USDOE Office of Energy Research, Washington, DC (United States). Scientific Computing Staff. [1991]. From 1. energy research power supercomputer users symposium; Gaithersburg, MD (United States); 21-22 May 1991. In *Proceedings of the first energy research power supercomputer users symposium.* 173p. Order Number DE91018877. Source: OSTI; NTIS; INIS.

Recently, through the development of supercomputers, a powerful new method for exploring plasmas has emerged; it is computer modeling of plasmas. Such modeling can duplicate many of the complex processes that go on in a plasma and allow scientists to understand what the important processes are. It helps scientists gain an intuition about this complex state of matter. It allows scientists and engineers to explore new ideas on how to use plasma before building costly experiments; it allows them to determine if they are on the right track. It can duplicate the operation of devices and thus reduce the need to build complex and expensive devices for research and development. This is an exciting new endeavor that is in its infancy, but which can play an important role in the scientific and technological competitiveness of the US. There are a wide range of plasma models that are in use. There are particle models, fluid models, hybrid particle fluid models. These can come in many forms, such as explicit models, implicit models, reduced dimensional models, electrostatic models, magnetostatic models, electromagnetic models, and almost an endless variety of other models. Here the author will only discuss particle models. He will give a few examples of the use of such models; these will be taken from work done by the Plasma Modeling Group at UCLA because he is most familiar with work. However, it only gives a small view of the wide range of work being done around the US, or for that matter around the world.

20354 (CONF-9105202–, pp. 6, Paper 13) **Fluid-particle hybrid simulation of tokamak plasmas.** Park, W. (Princeton Univ., NJ (United States)); Parker, S.; Lee, W.W.; Monticello, D.A. USDOE Office of Energy Research, Washington, DC (United States). Scientific Computing Staff. [1991]. DOE Contract AC02-76CH03073. From 1. energy research power supercomputer users symposium; Gaithersburg, MD (United States); 21-22 May 1991. In *Proceedings of the first energy research power supercomputer users symposium.* 173p. Order Number DE91018877. Source: OSTI; NTIS; INIS.

Present-day tokamaks, such as TFTR at Princeton Univ., and JET in Europe, have produced hot plasmas (ionized gas) which are approaching the break-even condition. At the break-even condition, the heat input required would be equal to the fusion power output if deuterium-tritium plasmas were used instead of the currently used deuterium-only plasmas. Such deuterium-tritium TFTR experiments are currently planned for 1993. In these experiments, the energetic Alpha particles produced by fusion reactions will play an important role in determining the outcome of the plasma discharge. Alpha particle physics will become even more important in the proposed Burning Plasma Experiment (BPX). In the paper, the authors describe their method for the numerical simulation of the Alpha effects, namely the fluid-particle hybrid model where the Alpha particles are followed numerically as individual particles, while the background plasma is treated as fluid. They start by first describing the fluid model.

20355 (CONF-9105202–, pp. 8, Paper 15) **Fluid simulation of drift-resistive ballooning modes and the L-H transition in tokamaks.** Guzdar, P.N. (Univ. of Maryland, College Park (United States)); Drake, J.F.; Hassam, A.B.; McCarthy, D.; Liu, C.S. USDOE Office of Energy Research, Washington, DC (United States). Scientific Computing Staff. [1991]. From 1. energy research power supercomputer users symposium; Gaithersburg, MD (United States); 21-22 May 1991. In *Proceedings of the first energy research power supercomputer users symposium.* 173p. Order Number DE91018877. Source: OSTI; NTIS; INIS.

Over the last decade one of the significant scientific findings in tokamak research is the existence of two modes of operation: the L (low confinement) and H (high confinement) modes. In L mode operation the introduction of auxiliary power raises the temperature (as expected) but at the same time degrades the energy confinement. However, as the auxiliary power increases beyond a critical level of the tokamak discharge makes an abrupt transition to the H mode. The confinement time is about 2 to 3 times better than in L mode discharges. The present design of ITER is based on L mode operation. Because of the low confinement, the size of the machine has to be appropriately scaled up. This readily translates into a scaled up budget for the program. This pessimistic L mode scenario is used in the design of ITER since there is no detailed understanding of the L-H transition. The estimated cost for ITER based on the H-mode operation is $1B compared to $5B for the L-Mode scenario. Thus the understanding of L-H transitions in magnetic fusion research is an important problem both from the scientific as well as economic point of view. In this study the authors made a modest first principles approach towards understanding the process of L-H transitions. The basic framework is the use of fluid equations to characterize the plasma in the edge region of tokamaks. These 3D fluid equations (Braginskii) are solved using a CRAY II at NERSC in Livermore, California.

20356 (CONF-9105202–, pp. 6, Paper 16) **Gyrokinetic particle simulation on massively parallel computers: A computational tokamak for fusion research.** Lee, W.W. (Princeton Univ., NJ (United States)); Parker, S.E.; Reynders, J.V.W.; Santoro, R.A. USDOE Office of Energy Research, Washington, DC (United States). Scientific Computing Staff. [1991]. From 1. energy research power supercomputer users symposium; Gaithersburg, MD (United States); 21-22 May 1991. In *Proceedings of the first energy research power supercomputer users symposium.* 173p. Order Number DE91018877. Source: OSTI; NTIS; INIS.

One of the most challenging problems in tokamak fusion research is the identification of the mechanism(s) responsible for the particle and heat loss across the confining magnetic field, known as anomalous transport. Although great strides have been made over the past forty years in understanding the behavior of magnetically-confined plasmas, the transport issue remains largely unresolved. With the recent advances in plasma modeling using particle simulation techniques and the availability of the massively parallel computers, the authors are now in a position to initiate a comprehensive study of this important problem. In doing so, they hope that a reliable scaling law will emerge, which can give them a better projection of the ignition margin for the future tokamaks, such as ITER (International Tokamak Engineering Reactor) and BPX (Burning Plasma Experiment), and, in turn, can bring fusion energy a step closer to reality.

20357 (CONF-9105202–, pp. 8, Paper 18) **Emerging computational techniques to predict confinement in fusion devices.** Kotschenreuther, M. (Univ. of Texas, Austin (United States)); Miner, W.H. USDOE Office of Energy Research, Washington, DC (United States). Scientific Computing Staff. [1991]. From 1. energy research power supercomputer users symposium; Gaithersburg, MD (United States); 21-22 May 1991. In *Proceedings of the first energy research power supercomputer users symposium.* 173p. Order Number DE91018877. Source: OSTI; NTIS; INIS.

Newly developed computational techniques are used to better quantitatively define a fundamental technical capability needed for controlled fusion energy: the degree to which a hot thermonuclear plasma can be contained by magnetic fields. First, the ramifications to the Magnetic Fusion Energy program of uncertainties in this basic technical element are indicated, to set the context for the importance of such calculations. Limitations of previous calculations to deduce confinement are noted, which are overcome by the new techniques used here. An application of these techniques shows that a particular instability mechanism which had been widely believed to control confinement is, to the contrary, of relatively minor importance. This demonstrates the importance of the greater accuracy and completeness offered by the new algorithm.

20358 (CONF-910711–9) **Electron transport in the stochastic fields of RFP ZT-40M.** Punjabi, A. (Hampton Univ., VA (United States)); Verma, A.; Kim, Myung-Hee; Boozer, A. Hampton Univ., VA (United States). [1991]. 2p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG05-90ER54106 ;FG05-88ER53265. From 20. international conference on phenomena in ionized gases; Barga (Italy); 8-12 Jul 1991. Order Number DE92013226. Source: OSTI; NTIS; INIS; GPO Dep.

In this paper, we use our newly developed Monte Carlo Method to study the transport of electrons in stochastic magnetic fields of the device RFP ZT4OM. The results of this calculation will be compared with the Rechester-Rosenbluth scaling.

20359 (CONF-920311–2) **Effects of limiter biasing on the ATF torsatron.** Uckan, T. (Oak Ridge National Lab., TN (United States)); Baylor, L.R.; Bell, J.D.; Bigelow, T.S.; England, A.C.; Harris, J.H.; Isler, R.C.; Jernigan, T.C.; Lyon, J.F.; Ma, C.H.; Mioduszewski, P.K.; Murakami, M.; Rasmussen, D.A.; Wilgen, J.B.; Aceto, S.C.;.Oak Ridge National Lab., TN (United States). [1992]. 15p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. From 10. international conference on plasma-surface interactions in controlled fusion devices; Monterey, CA (United States); 30 Mar - 3 apr 1992. Order Number DE92011782. Source: OSTI; NTIS; INIS; GPO Dep.

Positive limiter biasing on the currentless ATF torsatron produces a significant increase in the particle confinement with no improvement in the energy confinement. Experiments have been carried out in 1-T plasmas with ~400 kW of ECH. Two rail limiters located at the last closed flux surface (LCFS), one at the top and one at the bottom of the device, are biased at positive and negative potentials with respect to the vessel. When the limiters are positively biased at up to 300 V, the density increases sharply to the ECH cutoff value. At the same time, the H_α radiation drops, indicating that the particle confinement improves. When the density is kept constant, the H_α radiation is further reduced and there is almost no change of plasma stored energy. Under these conditions, the density profile becomes peaked and the electric field becomes outward- pointing outside the LCFS and more negative inside the LCFS. In contrast, negative biasing yields some reduction of the density and stored energy at constant gas feed, and the plasma potential profile remains the same. Biasing has almost no effect on the intrinsic impurity levels in the plasma.

20360 (CONF-920362–9) **Diagnostic needs for fluctuations and transport studies.** Carreras, B.A. Oak Ridge National Lab., TN (United States). [1992]. 40p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. From 9. topical conference on high-temperature plasma diagnostics; Santa Fe, NM (United States); 15-19 Mar 1992. Order Number DE92011048. Source: OSTI; NTIS; INIS; GPO Dep.

The identification of fundamental transport mechanisms in magnetically confined plasmas is a critical issue for the magnetic fusion program. Recent progress in understanding fluctuations and transport is well correlated with the development and use of new diagnostics, but there a great deal of information is still missing. Some of the required measurements are well beyond our present diagnostic capabilities, but some are within reach and could answer critical questions in this area of research. Some of these critical issues are discussed.

20361 (CONF-920362–23) **Density profile measurement using a multichannel difluoromethane laser interferometer system on ATF.** Ma, C.H.; Baylor, L.R.; Hutchinson, D.P.; Murakami, M.; Wilgen, J.B. Oak Ridge National Lab., TN (United States). [1992]. 10p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. From 9. topical conference on high-temperature plasma diagnostics; Santa Fe, NM (United States); 15-19 Mar 1992. Order Number DE92011691. Source: OSTI; NTIS; INIS; GPO Dep.

Recent results of the electron density profile measurement on the Advanced Toroidal Facility (ATF) are presented. A multichannel difluoromethane laser interferometer system has been routinely employed to study density evolution in ECH as well as neutral-beam-heated plasma discharges with gas fueling and pellet injection. A chordal inversion code has been developed, and has been used successfully to reconstruct the asymmetric density profiles. Cross-correlation of density profiles measurements among FIR interferometer, Thomson scattering, the heavy-ion beam probe, and the fast reciprocating Langmuir probe has been achieved. Radial density profiles measured by the four diagnostics are generally in good agreement and are hollow profiles under most experimental conditions.

20362 (CTH-IEFT-PP–1991-23) **Stochastic nature of ICRF wave-particle interaction in tokamaks.** Helander, P.; Lisak, M. Chalmers Univ. of Technology, Goeteborg (Sweden). Inst. for Electromagnetic Field Theory and Plasma Physics. [1991]. 23p. Order Number DE92625097. Source: OSTI; NTIS (US Sales Only); INIS.

The threshold in wave amplitude for the onset of stochastic motion of ICRF heated minority ions in tokamaks is calculated. As a separate result, the solutions to the guiding centre equations of motion are presented. The effects of the finite orbit width of high energy particles and the ellipticity of the flux surfaces are fully taken into account. Because of drift motion, co-passing particle require weaker wave fields for stochastization than counter-passing ones. The orbits of trapped particles become even more easily stochastic, and near the trapped (passing boundary) an arbitrarily weak wave field is needed for orbit stochastization. Finite orbit width effect have significant impact on the results, decreasing the stochastization amplitude near the magnetic axis. For realistic JET parameters, only a small fraction of the minority ions move stochastically in a monochromatic IRCF wave field. (author).

20363 (DOE/ER/53214–2) **Spectroscopic diagnostics of high temperature plasmas: [Annual report].** Moos, W. Johns Hopkins Univ., Baltimore, MD (United States). Dept. of Physics and Astronomy. [1990]. 57p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG02-86ER53214. Order Number DE92013153. Source: OSTI; NTIS; INIS; GPO Dep.

A three-year research program for the development of novel XUV spectroscopic diagnostics for magnetically confined fusion plasmas is proposed. The new diagnostic system will use layered synthetic microstructures (LSM) coated, flat and curved surfaces as dispersive elements in spectrometers and narrow band XUV filter arrays. In the framework of the proposed program we will develop impurity monitors for poloidal and toroidal resolved measurements on PBX-M and Alcator C-Mod, imaging XUV spectrometers for electron density and temperature fluctuation measurements in the hot plasma core in TEXT or other similar tokamaks and plasma imaging devices in soft x-ray light for impurity behavior studies during RF heating on Phaedrus T and carbon pellet ablation in Alcator C-Mod. Recent results related to use of multilayer in XUV plasma spectroscopy are presented. We also discuss the latest results reviewed to q_o and local poloidal field measurements using Zeeman polarimetry.

20364 (DOE/ER/53214–T1) **Extreme ultraviolet and soft x-ray diagnostics of high-temperature plasmas: Progress report.** Moos, W. Johns Hopkins Univ., Baltimore, MD (United States). Dept. of Physics and Astronomy. 2 Oct 1986. 14p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG02-86ER53214. Order Number DE92013133. Source: OSTI; NTIS; GPO Dep.

This report describes recent progress and plans for calendar year 1987 in the Johns Hopkins University program to develop and improve spectroscopic diagnostics for the high temperature plasmas used in magnetic fusion research. An EUV spectrograph which provides time resolved spectra along fifteen chords of a plasma device has been completed and evaluation on DIII-D will began in late 1986. Other instrumentation work includes the evaluation of a sensitive detector for ion temperature/velocity distribution determinations and a feasibility study of Zeeman polarimetry for determining magnetic fields. A comprehensive data set taken on the TEXT tokamak is undergoing analysis as a means of improving the ionic parameters used in diagnostic studies and to expand the capabilities of existing instruments. Potential new advanced in spectroscopic technology are being monitored to determine if they provide advantages for fusion research.

20365 (DOE/ER/53250–3) **Non-local kinetic transport studies of a field-reversed configuration: Annual technical report, July 1, 1988–June 30, 1989.** Choi, Chan K. Purdue Univ., Lafayette, IN (United States). School of Nuclear Engineering. [1989]. 29p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG02-87ER53250. Order Number DE92012376. Source: OSTI; NTIS; INIS; GPO Dep.

One of the positive results that came from the work in this period was the development of a series of codes for solving the 2-D equilibrium FRC problem under various basic physics assumptions. The derivation of the models used to determine an FRC equilibrium was presented in the previous annual report, which is to be submitted to Physics of Fluids. The derivation is not repeated in this section; rather, some examples of what has been learned using these codes are presented. To date, the codes have been useful in four essential areas. First, it was shown that passive mirrors present in the early operation of the LSM device were interacting strongly with the plasma. This caused the inference of some key quantities to be inaccurate. Second, profiles have been found that can exist in the plasma and could cause the present inference of the field null resistivity to be significantly in error. Third, it has become possible to examine rotational effects in the FRC equilibrium from the standpoint of modification of both equilibrium and stability properties. Fourth, it has made possible a realistic study of the MHD stability of the system.

20366 (DOE/ER/53250–5) **Non-local kinetic transport studies of a field reversed configuration: Annual technical report, July 1, 1989–June 30, 1990.** Choi, Chan K. Purdue Univ., Lafayette, IN (United States). School of Nuclear Engineering. [1990]. 26p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG02-87ER53250. Order Number DE92012377. Source: OSTI; NTIS; INIS; GPO Dep.

During this past period a computer code was developed to determine the global kinetic linear stability for a 1-D Field-Reversed Configuration (FRC). This report will describe the physical assumptions used to model the plasma, the equations solved by the code, the numerical analysis for certain aspects of the code, and some preliminary results from the code.

20367 (DOE/ER/54131–1) **Non-geothermal optics study of wave propagation: Annual progress report, August 1991–March 1992.** Imre, K. College of Staten Island, NY (United States). Mar 1992. 9p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG02-91ER54131. Order Number DE92011806. Source: OSTI; NTIS; INIS; GPO Dep.

A statistical theory of growth curve analysis, which makes use of smoothing splines is formulated and coded for applications. We have tested our codes extensively using computer generated data superposed with random noise of various intensities, by simultaneously fitting all data with two independent variables. We are presently evaluating various experimental data in the MFE database by making use of our codes. Our preliminary results indicate that TFTR ohmic temperature profile shape depends almost exclusively on the edge plasma safety factor, q_a, as was previously shown to be true for ASDEX plasma profiles. The main advantage of the utilization of a simultaneous fitting of all (appropriately normalized) profiles as a function of more than one plasma parameter, is to improve significantly the signal to noise ratio. We also determine the amount of smoothing to be applied during the curve fitting process. An optimally selected smoothing helps to reduce the random noise, but yet allows the predictions to stay close to the data. In addition, the use of a multi-dimensional parameter field provides us with a uniformly valid representation. The curve fitting technique we employ uses a piecewise polynomial spline representation. However, we have eliminated the usually adopted method of setting a simple knot at every data point, for the reason that the experimentally obtained data is usually confined to the values of the plasma parameters bunched together in small intervals which are widely separated. Presently, we are using equally spaced knots.

20368 (DOE/ET/53088–530) **Nonlinear evolution of resistive tearing mode instability with shear flow and viscosity.** Ofman, L. (Texas Univ., Austin, TX (United States). Inst. for Fusion Studies); Morrison, P.J.; Steinolfson, R.S. Texas Univ., Austin, TX (United States). Inst. for Fusion Studies. Dec 1991. 41p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG05-80ET53088. (IFSR–530). Order Number DE92012138. Source: OSTI; NTIS; INIS; GPO Dep.

The nonlinear evolution of the tearing mode instability with equilibrium shear flow is investigated via numerical solutions of the resistive magnetohydrodynamic equations. The two-dimensional simulations are in slab geometry, are periodic in the x-direction, and are initiated with solutions of the linearized MHD equations. The magnetic Reynolds number S was varied from 10^2 to 10^5, a parameter V that measures the strength of the flow in units of the average Alfven speed was varied, and the viscosity as measured by the Reynolds number of S_v satisfied $S_v > 10^3$. When the shear flow is small ($V < 0.3$) the tearing mode saturates within one resistive time, while for larger flows the nonlinear saturation develops on a longer time scale. The two-dimensional spatial structure of both the flux function and the steam function distort in the direction of the equilibrium flow. The magnetic energy release decreased and the saturation time increased with V, for both small and large resistivity. The validity of the numerical solutions was tested by verifying that the total energy and the magnetic helicity were conserved. Total energy dissipation rate dE/dt decreases as the tearing mode approached its saturated state.

20369 (DOE/ET/53088–541) **Low-frequency fluctuations in plasma magnetic fields.** Cable, S.; Tajima, T. Texas Univ., Austin, TX (United States). Inst. for Fusion Studies. Feb 1992. 84p. Sponsored by USDOE, Washington, DC (United States); National Science Foundation, Washington, DC (United States). DOE Contract FG05-80ET53088. (IFSR–541). Order Number DE92012139. Source: OSTI; NTIS; INIS; GPO Dep.

It is shown that even a non-magnetized plasma with temperature T sustains zero-frequency magnetic fluctuations in thermal equilibrium. Fluctuations in electric and magnetic fields, as well as in densities, are computed. Four cases are studied: a cold, gaseous, isotropic, non-magnetized plasma; a cold, gaseous plasma in a uniform magnetic field; a warm, gaseous plasma described by kinetic theory; and a degenerate electron plasma. For the simple gaseous plasma, the fluctuation strength of the magnetic field as a function of frequency and wavenumber is calculated with the aid of the fluctuation-dissipation theorem. This calculation is done for both collisional and collisionless plasmas. The magnetic field fluctuation spectrum of each plasma has a large zero-frequency peak. The peak is a Dirac δ-function in the collisionless plasma; it is broadened into a Lorentzian curve in the collisional plasma. The plasma causes a low frequency cutoff in the typical black-body radiation spectrum, and the energy under the discovered peak approximates the energy lost in this cutoff. When the imposed magnetic field is weak, the magnetic field were vector fluctuation spectra of the two lowest modes are independent of the strength of the imposed field. Further, these modes contain finite energy even when the imposed field is zero. It is the energy of these modes which forms the non-magnetized zero-frequency peak of the isotropic plasma. In deriving these results, a simple relationship between the dispersion relation and the fluctuation power spectrum of electromagnetic waves if found. The warm plasma is shown, by kinetic theory, to exhibit a zero-frequency peak in its magnetic field fluctuation spectrum as well. For the degenerate plasma, we find that electric field fluctuations and number density fluctuations vanish at zero frequency; however, the magnetic field power spectrum diverges at zero frequency.

20370 (ETDE-IT--92-20) **Power flux distribution on capsule enclosed in radiating cavity.** Dattoli, G.; Mari, C.; Mezi, L.; Torre, A. ENEA, Frascati (Italy). 1991. 12p. (CONF-910247-4: International conference on research trends in inertial confinement fusion, La Jolla, CA (United States), 4-9 Feb 1991). Order Number DE92506284. Source: OSTI; NTIS (US Sales Only); INIS.

Within the framework of studies on inertial confinement fusion, this paper examined how non-uniformities in the distribution of the radiation sources on the surface of a radiating cavity are reduced by geometrical averaging, i.e., by the fact that a given point upon a spherical capsule, enclosed within, 'sees' an extended cavity area. It was evaluated how this reduction depends on the relative cavity/capsule size and on the non-uniformity wavelength. With regard to the emitter, two cases were considered, that of an optically thick emitting layer, and that of an optically thin one, according to two angular distributions (the frequency label is neglected) in which the specific intensity upon the cavity was assumed to have cylindrical symmetry.

20371 (ETDE-IT--92-30) **Effect of poloidal field null on alpha-particle orbits in axisymmetric tokamaks.** Batistoni, P.; Segre, S.E. ENEA, Frascati (Italy). 1991. 17p. (CONF-9106209-5: International Atomic Energy Agency (IAEA) technical committee meeting on alpha particles in fusion, Aspenas (Sweden), 10-14 Jun 1991). Order Number DE92506246. Source: OSTI; NTIS (US Sales Only).

The effect of a poloidal magnetic field null (X-point region) on the orbits of energetic fusion products is analysed. It is found that the resulting poloidal distribution of lost particles is strongly peaked in the vicinity of the X-point, for an axisymmetric magnetic field distribution. This effect should be considered, together with the effect of field ripple, in the analysis of energetic particle diagnostics and of loading of wall structures.

20372 (ETDE-IT--92-31) **Alpha particle confinement and loss distribution in stellarators as function of aspect ratio.** Alladio, F.; Batistoni, P.; Mancuso, A. ENEA, Frascati (Italy). 1991. 24p. (CONF-9106209-6: International Atomic Energy Agency (IAEA) technical committee meeting on alpha particles in fusion, Aspenas (Sweden), 10-14 Jun 1991). Order Number DE92506247. Source: OSTI; NTIS (US Sales Only).

The properties of alpha particle confinement of $m = 2$ stellarators have been studied as a function of the aspect ratio. A collisionless orbit calculation has been performed numerically for stellarator configurations obtained winding the helicoidal currents on circular cross section tori with constant pitch in toroidal coordinates. All the studied configurations exhibit pronounced- separatrix like features that also rotate with constant pitch in toroidal coordinates. The fraction of alpha particles contained within the last closed magnetic surface rapidly increases with the aspect ratio and is higher than 80% for $R/a>4$. The escaping alpha particles cross the separatrix within narrow helical strips around the X-point path when it is between the inboard and the upboard of the torus. The particle motion is also followed outside the closed magnetic surface. When the boundary (i.e. the surface where the helicoidal currents flow) is sufficiently far from the plasma, the escaping alpha particles are found to remain trapped in the X-point region.

20373 (FRCEA-TH-353) **Energy recovery in high energy neutral beam injectors.** Laffite, S. Association Euratom-CEA, Centre d'Etudes Nucleaires de Cadarache, 13 - Saint-Paul-lez-Durance (France). Dept. de Recherches sur la Fusion Controlee; Aix-Marseille-1 Univ., 13 - Marseille (France). Jul 1991. 262p. (In French). Order Number DE92517880. Source: OSTI; NTIS (US Sales Only); INIS.

One way to heat the plasma of thermonuclear fusion experiments, is to inject high energy (50 to 100 KeV per nucleon), neutral particles (hydrogen or deuterium). Neutral beam elaboration consists in ion production and acceleration, neutralisation by charge exchange on gas target, disposal of unneutralized ions. But, in the case of positive ion based neutral beam injection, the neutralisation efficiency is limited to 50% at 100 KeV, and decreases rapidly with energy. The energy recovery is a new method for disposing of the unneutralized ions: these are electrostatically decelerated and collected on electrodes which are polarized at low voltage, close to the ion source potential. An energy recovery system was studied and experimented with positive ion beams of 50 and 100 KeV. In the framework of a french-japanese collaboration, we measured a relative power reduction of about 20%, with 100 KeV, 1,5 MW deuterium beams. We have also studied theoretically an energy recovery system for negative ion beams, which will be utilized at high energy (1 MeV). A relative power reduction of 20% can be expected in the best conditions.

20374 (GA-A--20849) **Design and operation of the multi-pulse Thomson scattering diagnostic on DIII-D.** Carlstrom, T.N. (General Atomics, San Diego, CA (United States)); Campbell, G.L.; DeBoo, J.C.; Evanko, R.; Greenfield, C.M.; Haskovec, J.; Hsieh, C.L.; McKee, E.; Snider, R.T.; Stockdale, R.; Trost, P.K.; Thomas, M.P.; Evans, J. General Atomics, San Diego, CA (United States). Mar 1992. 21p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC03-89ER51114. (CONF-920362-21: 9. topical conference on high-temperature plasma diagnostics, Santa Fe, NM (United States), 15-19 Mar 1992). Order Number DE92011393. Source: OSTI; NTIS; INIS; GPO Dep.

This paper describes the design and operation of a 40 spatial channel Thomson scattering system that uses multiple 20 Hz Nd:YAG lasers to measure the electron temperature and density profiles periodically throughout an entire plasma discharge. As many as eight lasers may be fired alternately for an average measurement frequency of 160 Hz, or they may be fired in rapid succession (< 10 kHz), producing a burst of pulses for measuring transient events. The high spatial resolution (1.3 cm) and wide dynamic range (10 eV to 20 keV) enable this system to resolve large electron density and temperature gradients formed at the plasma edge and in the scrape-off-layer during H-mode operation. These features provide a formidable tool for studying L-H transitions, edge localized modes (ELMs), beta limits, transport, and disruptions in an efficient manner suitable for large tokamak operation where shot-to-shot scans are impractical. The scattered light is dispersed by interference filter polychromators and detected by silicon avalanche photodiodes. Laser control and data acquisition are performed in real-time by a VME based microcomputer. Data analysis is performed by a MicroVAX 3400. Additional features of this system include real-time analysis capability, full statistical treatment of error bars based on the measured background light, and laser beam quality and alignment monitoring during plasma operation. Results of component testing, calibration, plasma operation, and error analysis are presented.

20375 (GA-A--20855) **Short wavelength interferometer for ITER.** Snider, R.T.; Carlstrom, T.N. General Atomics, San Diego, CA (United States). Apr 1992. 14p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC03-89ER51114. (CONF-920362-25: 9. topical conference on high-temperature plasma diagnostics, Santa Fe, NM (United States), 15-19 Mar 1992). Order Number DE92013008. Source: OSTI; NTIS; INIS; GPO Dep.

There is a need for a real time, reliable density measurement compatible with the restricted access and radiation environment on ITER. Due to the large plasma path length, high density and field, refraction and Faraday rotation effects makes the use of contemporary long wavelength ($>50\mu m$) interferometers impractical. In this paper we consider the design of a short wavelength vibration compensated interferometer which allows operation without a prohibitively large vibration isolated structure and permits the optics to be conveniently mounted directly in or on the tokamak. A density interferometer design for ITER incorporating a 10.6 μm CO_2 interferometer with vibration compensation provided by a 3. 39 μm HeNe laser is discussed. The proposed interferometer design requires only a small intrusion into the ITER tokamak without a large support structure, refraction and Faraday rotation problems are avoided, and it provides a density resolution of at least 0.5%. Results are presented from an interferometer installed on the DIII-D tokamak incorporating essential elements of the proposed ITER design including 10.6 and 3.39 μm lasers, a retro-reflector mounted on the vacuum wall of the DIII-D tokamak and real-time density feedback control. In this paper we consider a short wavelength interferometer design that incorporates vibration compensation for use on ITER. Our primary concern is to develop a interferometer design that will produce a reliable real time density monitor. We use the ITER conceptual design activity report as the basis of the design.

20376 (GA-A–20876) **A phase contrast interferometer on DIII-D.** Coda, S. (Massachusetts Inst. of Tech., Cambridge, MA (United States)); Porkolab, M.; Carlstrom, T.N. General Atomics, San Diego, CA (United States). Apr 1992. 9p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC03-89ER51114. (CONF-920362–24: 9. topical conference on high-temperature plasma diagnostics, Santa Fe, NM (United States), 15-19 Mar 1992). Order Number DE92012699. Source: OSTI; NTIS; INIS; GPO Dep.

A novel imaging diagnostic has recently become operational on the DIII-D tokamak for the study of density fluctuations at the outer edge of the plasma. The phase contrast imaging approach overcomes the limitations of conventional scattering techniques in the spectral range of interest for transport-related phenomena, by allowing detection of long wavelength modes (up to 7.6 cm) with excellent spatial resolution (5 mm) in the radial direction. Additional motivation for the diagnostic is provided by wave-plasma interactions during heating and current drive experiments in the Ion Cyclotron range of frequencies. Density perturbations of 4×10^7 cm^{-3} with a 1 MHz bandwidth can be resolved. The diagnostic employs a 7.6 cm diameter CO_2 laser beam launched vertically across the plasma edge. An image of the plasma is then created on a 16-element detector array: the detector signals are directly proportional to the density fluctuations integrated along each chord. Wavelengths and correlation lengths can be inferred from the spatial mapping. The phase contrast method and its application to DIII-D are described and tests and first plasma data are presented.

20377 (INIS-mf–13178, pp. 97-120) **Update on the international status of cold fusion.** Srinivasan, M. (Bhabha Atomic Research Centre, Bombay (India). Neutron Physics Div.). Department of Atomic Energy, Bombay (India). Board of Research in Nuclear Sciences. 1991. 269p. (CONF-9101139–: Solid state physics symposium, Bombay (India), 1-4 Jan 1991). In *Proceedings of the solid state physics symposium: Combined Vol. 32A and Vol. 33A: Invited talks.* Order Number DE92001361. Source: OSTI; NTIS (US Sales Only); INIS.

A broad overview of the cold fusion scene as it stands by the end of December 1990 is presented. It covers: (1) calorimetry/excess heat studies in D_2O electrolysis, (2) molten salt electrolysis experiment, (3) evidence for neutrons and tritium in electrolysis experiments, (4) 4 to 6 MeV energy neutron component in electrolysis, (5) charged particles and X-rays in electrolysis experiments, (6) neutron emission and charged particles from gas loaded Ti, (7) charged particles from ion-beam loaded Ti, (8) precursor to charged particle emission from gas loaded Pd, (9) solid state cell experiments and (10) neutron production in a Pd surface barrier plate. (M.G.B.). 60 refs., 8 figs., 2 tabs.

20378 (INIS-mf–13192, pp. 195-196) **Interaction of lower hybrid waves with thermonuclear alpha particles in tokamak reactor.** Krlin, L. (Ceskoslovenska Akademie Ved, Prague (Czechoslovakia). Ustav Fyziky Plazmatu); Pavlo, P.; Klima, R. Jednota Ceskoslovenskych Matematiku a Fyziku, Prague (Czechoslovakia). 1991. 319p. (In Czech). (CONF-9008243–: 10. conference of Czechoslovak physicists, Brno (Czechoslovakia), 27-31 Aug 1990). In *The tenth conference of Czechoslovak physicists.* Order Number DE92628439. Source: OSTI; NTIS (US Sales Only); INIS.

A brief quantitative evaluation is presented of the absorption of the lower hybrid wave on the resonance with high overtones of the cyclotron motion in the ITER tokamak, which is an international tokamak reactor project. Fusion of tritium and deuterium nuclei producing 3.5 MeV alpha particles should take place in the tokamak reactor. The cyclotron motion radius for these particles in the tokamak's magnetic field ($\approx$ 5T) is substantially higher than the wavelength of the lower hybrid wave, and this is what makes possible absorption of that wave on the resonance $\omega = n\omega_c$ (ω is the frequency of the wave and ω_c is the cyclotron frequency of the alpha particles; $n >> 1$). The resonance is unwanted because it withdraws energy of waves destined for electrons forming the toroidal electric current. Theory demonstrates that the absorption of lower hybrid waves by alpha particles drops rapidly if their frequency is increased to above a critical value f_k. This value depends on the plasma density, magnetic field intensity and alpha particle energy. The results of computer modeling of the effect of alpha particles on the current generation by lower hybrid waves are described. A quite new finding concerned the existence of accelerated particles with an energy exceeding 10 MeV, which contribute substantially to the unwanted absorption of waves. The ratios of powers absorbed on alpha particles and on electrons were also determined for the ITER project. At a frequency of 4 GHz the ratio is about 10%, whereas at frequencies $\geq$ 5 GHz it is negligible. (Z.S.). 3 figs., 4 refs.

20379 (INIS-mf–13192, pp. 113-116) **Simulation of laser-matter interaction in subpicosecond range using computer algebra for numerical code development.** Drska, L. (Ceske Vysoke Uceni Technicke, Prague (Czechoslovakia). Fakulta Jaderna a Fysikalne Inzenyrska); Limpouch, J.; Liska, R. Jednota Ceskoslovenskych Matematiku a Fyziku, Prague (Czechoslovakia). 1991. 319p. (CONF-9008243–: 10. conference of Czechoslovak physicists, Brno (Czechoslovakia), 27-31 Aug 1990). In *The tenth conference of Czechoslovak physicists.* Order Number DE92628439. Source: OSTI; NTIS (US Sales Only); INIS.

The interaction of extremely short laser pulses with plasma is studied using numerical simulation. The FIDE package is briefly described, used for semiautomatic development and analysis of the simulation code. The physical model and the results of simulation of the interaction of a 1 ps laser pulse with an Al plasma are presented. The processes of laser absorption and heat flux limitations are discussed. (author). 3 figs., 12 refs.

20380 (INIS-mf–13192, pp. 197-198) **Plasma experiments with iodine laser system PERUN.** Chvojka, M. (Ceskoslovenska Akademie Ved, Prague (Czechoslovakia). Fyzikalni Ustav); Kralikova, B.; Krasa, J.; Laska, L.; Masek, K.; Rohlena, K.; Rus, B.; Skala, J. Jednota Ceskoslovenskych Matematiku a Fyziku, Prague (Czechoslovakia). 1991. 319p. (In Czech). (CONF-9008243–: 10. conference of Czechoslovak physicists, Brno (Czechoslovakia), 27-31 Aug 1990). In *The tenth conference of Czechoslovak physicists.* Order Number DE92628439. Source: OSTI; NTIS (US Sales Only); INIS.

The iodine photodissociation laser system PERUN was used for the generation of laser plasma. Three types of aluminium targets were employed. The laser pulse duration was 300 to 600 ps and contrast was better than 10^6. The power density at the target was to exceed $10^{13}/cm^2$, a value sufficient for the formation of hot laser plasma. The most important property of hot laser plasma is its ability to emit soft X-rays over the 0.1-10 nm range. The interaction chamber was therefore fitted with X-ray diagnostic equipment. Two crystal spectrometers were employed for spectral analysis of the emerging X-rays (particularly in the region of the line spectrum), and a pair of Be foils, acting as filters and also equipped with a pair of Si PIN diodes for recording, served to measure the temperature in the continuous spectral region. The time behavior of the emission could be examined in the visible region only, using a Hamamatsu streak camera. The observed plasma temperature was $(0.4\text{-}1.6)\times 10^{20}$ cm^{-3}, in dependence on the incident energy. (Z.S.). 3 refs.

20381 (INIS-mf–13192, pp. 253) **Compact spectrometer for laser plasma diagnostics.** Renner, O. (Ceskoslovenska Akademie Ved, Prague (Czechoslovakia). Fyzikalni Ustav); Krousky, E.; Pina, L. Jednota Ceskoslovenskych Matematiku a Fyziku, Prague

(Czechoslovakia). 1991. 319p. (CONF-9008243–: 10. conference of Czechoslovak physicists, Brno (Czechoslovakia), 27-31 Aug 1990). In *The tenth conference of Czechoslovak physicists*. Order Number DE92628439. Source: OSTI; NTIS (US Sales Only); INIS.

20383 (IPP–5/37) **Unfolding of bolometer signals at the tokamak ASDEX Upgrade (case 1: On flux surfaces of constant emissivity).** Wunderlich, R.; Schneider, W.; Lackner, K. Max-Planck-Institut fuer Plasmaphysik, Garching (Germany). Jan 1992. 30p. (In German). Order Number DE92516984. Source: OSTI; NTIS (US Sales Only); INIS.

We describe an algorithm and present a FORTRAN programme which allow to derive the distribution of the radiation emission from measured bolometer signals using flux surface structures computed by an equilibrium code. The algorithm assumes the emissivity to be constant on flux surfaces. Test examples are given and the use of the programme for ASDEX-Upgrade is described. Making a proper redefinition of the quantities, the programme can also be applied to the interpretation of measurements of line densities and X-ray emission. (orig.).

20384 (IPP–6/304) **Magnetic reconnection.** Biskamp, D.; Welter, H. Max-Planck-Institut fuer Plasmaphysik, Garching (Germany). Oct 1991. 71p. Order Number DE92516509. Source: OSTI; NTIS (US Sales Only); INIS.

A review is given of the theory of magnetic reconnection in the framework of resistive magnetohydrodynamics (MHD). While most of the material refers to two-dimensional systems, the final sections give a brief outlook of problems arising in fully three-dimensional configurations. (orig.).

20385 (ITF–89-58) **Emission from inhomogeneous plasma layer.** Zagorodnij, A.G.; Korchinskij, G.M.; Yakimenko, I.P. AN Ukrainskoj SSR, Kiev (Ukraine). Inst. Teoreticheskoj Fiziki. 1989. 29p. (In Russian). Order Number DE92627439. Source: OSTI; NTIS (US Sales Only); INIS.

General relations for the radiation spectra of a plasma layer with inhomogeneous parameter distributions are obtained. A detailed numerical analysis of the spectra under consideration for different inhomogeneity profiles are performed. 8 refs.; 15 figs.

20386 (ITF–89-82) **Surface waves in half-space and inhomogeneous plasma layer.** Zagorodnij, A.G.; Korchinskij, G.M.; Yakimenko, I.P. AN Ukrainskoj SSR, Kiev (Ukraine). Inst. Teoreticheskoj Fiziki. 1989. 28p. (In Russian). Order Number DE92627455. Source: OSTI; NTIS (US Sales Only); INIS.

Within the framework of the hydrodynamic approach taking into account the electron pressure the dispersion relations for surface excitations in inhomogeneous plasma half-space and plasma layer are obtained. The numerical analysis of these relations is performed and on its basis the influence of plasma inhomogeneity on the dispersion and wave decrements is established. 18 refs.; 6 figs.

20387 (ITP–89-32) **Stationary spectra of short-wave low-frequency fluctuations in a finite-β plasma.** Sosenko, P.P.; Vakulenko, M.O. AN Ukrainskoj SSR, Kiev (Ukraine). Inst. Teoreticheskoj Fiziki. 1989. 7p. Order Number DE92627456. Source: OSTI; NTIS (US Sales Only); INIS.

Stationary spectra of strongly nonlinear potential and magnetic fluctuations in a finite-β plasma, are calculated. Magnetic fluctuations are shown to produce an essential influence on the potential spectra. 7 refs.

20388 (ITP–89-37) **Low-frequency turbulence in an inhomogeneous magnetized plasma.** Sitenko, A.G.; Sosenko, P.P. AN Ukrainskoj SSR, Kiev (Ukraine). Inst. Teoreticheskoj Fiziki. 1989. 9p. Order Number DE92627457. Source: OSTI; NTIS (US Sales Only); INIS.

The basic properties of low-frequency weak turbulence in magnetoactive plasma are discussed. It is noted that convective waves propagate in the ion diamagnetic drift direction. 11 refs.

20389 (ITP–89-38) **Electromagnetic effects in convective cells turbulence.** Sitenko, A.G.; Sosenko, P.P. AN Ukrainskoj SSR, Kiev (Ukraine). Inst. Teoreticheskoj Fiziki. 1989. 12p. Order Number DE92627458. Source: OSTI; NTIS (US Sales Only); INIS.

The main aspects of the statistical theory of low-frequency hydrodynamic fluctuations in a magnetized plasma are reviewed. It is shown that magnetic field fluctuations may influence essentially the potential fluctuation spectral characteristics, which determine the level of anomalous plasma transport. 15 refs.

20390 (ITP–89-59) **Electrodynamic properties of inhomogeneous magnetoactive plasma: low-frequency limit.** Sitenko, A.G.; Sosenko, P.P. AN Ukrainskoj SSR, Kiev (Ukraine). Inst. Teoreticheskoj Fiziki. 1989. 52p. Order Number DE92627459. Source: OSTI; NTIS (US Sales Only); INIS.

Low-frequency nonlinear electrodynamic properties of an inhomogeneous magnetoactive plasma are considered. Nonlinear convective and drift waves in plasma are studied as well. Plasma motion in crossed magnetic and gravitational fields and generation of magnetic fields in plasma are investigated. 68 refs.

20391 (ITP–89-60) **Parametric influence of powerful radiation on plasma surface.** Kuklin, V.M.; Panchenko, I.P.; Chernousenko, V.M. AN Ukrainskoj SSR, Kiev (Ukraine). Inst. Teoreticheskoj Fiziki. 1989. 28p. Order Number DE92627460. Source: OSTI; NTIS (US Sales Only); INIS.

A self-consistent set of equations that describes one-dimensional dynamics to develop the instability of long-wave intensive Langmuir wave is obtained and solved. The parametric instability influence on the character of absorption of the incident radiation energy is elucidated primarily. 40 refs.; 8 figs.

20392 (ITP–89-66) **Nonlinear electromagnetic fluctuations in plasmas (renormalization concept).** Sitenko, A.G.; Sosenko, P.P. AN Ukrainskoj SSR, Kiev (Ukraine). Inst. Teoreticheskoj Fiziki. 1989. 36p. Order Number DE92627461. Source: OSTI; NTIS (US Sales Only); INIS.

The basic aspects of the renormalized statistical plasma electrodynamics are discussed. 44 refs.

20393 (ITP–91-25) **On the temperature role in the tunneling process at the cold fusion.** Grinyuk, B.E.; Simenog, I.V. AN Ukrainskoj SSR, Kiev (Ukraine). Inst. Teoreticheskoj Fiziki. 1991. 12p. Order Number DE92627497. Source: OSTI; NTIS (US Sales Only); INIS.

The temperature dependence of the hydrogen isotopes cold fusion tunneling rate is estimated using a model of screened Coulomb interaction potential between the isotopes. The temperature dependences for the logarithm of the tunneling rate are calculated for pp-, pd-, pt- and dd-processes at different screening radii. Probable role of pp-reactions is discussed. 5 refs.; 4 figs.

20394 (JAERI-M–91-205) **Intermittent electric field in a random medium: A conjecture to cold fusion.** Tanaka, Masatoshi (Japan Atomic Energy Research Inst., Naka, Ibaraki (Japan). Naka Fusion Research Establishment). Japan Atomic Energy Research Inst., Tokyo (Japan). Dec 1991. 14p. (In Japanese). Order Number DE92514959. Source: OSTI; NTIS (US Sales Only); INIS.

Possible existence of an intermittent electric field in a medium, in which the electric conductivity is supposed to be a random quantity, is studied on the basis of a model equation. Implication to cold fusion is noted. (author).

20395 (JET-R–91-10) **The calculation of the neoclassical impurity transport coefficients.** Lauro Taroni, L. (Commission of the European Communities, Abingdon (UK). JET Joint Undertaking); Giannella, R.; Springmann, E.; Taroni, A.; Bittoni, E. Commission of the European Communities, Abingdon (UK). JET

Joint Undertaking. Oct 1991. 25p. Order Number DE92628700. Source: OSTI; NTIS (US Sales Only); INIS.

The analysis of impurity transport in recent years has revived interest for the neoclassical predictions against which the experimental data are compared. Here we will attempt to sketch the hierarchy in the numerous formulae of previous authors expanding (for the Pfirsch-Schluter coefficients) highlighting the conditions under which they reduce to the analytical approximations found in the literature. The full set of transport coefficients described in the following article has been implemented in a computer package and examples of results will be given. (author).

20396 (JET-R--91-12) **Charge-exchange diagnostic of fusion alpha particles and ICRF driven minority ions in MeV energy range in JET plasma.** Izvozchikov, A.B. (Ioffe Physical-Technical Inst., St. Petersburg (USSR)); Khudoleev, A.V.; Petrov, M.P.; Petrov, S.Ya.; Kozlovskij, S.S.; Corti, S.; Gondahalekar, A. Commission of the European Communities, Abingdon (UK). JET Joint Undertaking. Dec 1991. 41p. Order Number DE92628699. Source: OSTI; NTIS (US Sales Only); INIS.

An important concern in alpha particle heating physics is that fusion alpha particles will be lost before giving all their energy to heat the plasma. In other words, that the radial diffusion time of the alphas may be shorter than their slowing down time in the plasma core. Therefore radially resolved measurements of density and energy spectrum of slowing-down alphas confined in the plasma are high priority diagnostic objectives. In this report application of Charge Exchange Neutral Particle Analysis on Joint European Torus will be discussed. After a description of physical principles of the method a suitable Neutral Particle Analyzer (NPA) will be described in detail and estimates of measurement performance made for different plasma heating and confinement modes in JET. (author).

20397 (JET-R--91-14) **Neutral beam-plasma interaction in JET: comparison of PENCIL and TRANSP modelling results.** Corrigan, G.; Muir, D.G.; Tibone, F. Commission of the European Communities, Abingdon (UK). JET Joint Undertaking. Jan 1992. 76p. Order Number DE92628701. Source: OSTI; NTIS (US Sales Only); INIS.

Using the TRANSP code as a reference, the accuracy of predictions by the simpler and much faster PENCIL code has been checked in several Joint European Torus (JET) plasma regimes. For sufficiently dense plasmas ($<n_e>$ "approx." $1.5 \cdot 10^{19}$ m^{-3}) and far enough away from large steps in the input power ($t >$ "approx." $t_{STEP} + 0.5$ sec) global and local predictions by PENCIL and TRANSP are found to be in excellent agreement. PENCIL can thus be confidently used as a fast and inexpensive computational tool for most transport studies of neutral beam injection (NBI) heated plasmas in JET. On the other hand, PENCIL results should not be trusted in strongly transient conditions (such as the early phase of a high-power NBI heating pulse) and in very low density regimes (when losses via charge-exchange processes can be a significant fraction of the input power). In these situations, TRANSP has to be used to obtain reliable results. We also briefly discuss the sensitivity of PENCIL results to the uncertainties associated with the JET experimental data used as input. As a by-product of these comparisons, we investigate the uncertainties inherent in the simulation of D-D neutron yields in high-performance JET discharges such as those used for the Preliminary Tritium Experiment. It is shown that - given the margins of error on the measured plasma profiles - the thermal neutron rate (typically half of the total in the hot-ion H-mode regime) cannot be simulated by either PENCIL or TRANSP with an accuracy better than ± 40%. Further uncertainty arises from the choice of nuclear cross-sections and flux surface geometry. (author).

20398 (KIYaI--90-22) **Investigation of possibilities of light nuclear cold fusion.** Dryapachenko, I.P.; Kononov, A.V.; Muravitskij, A.V.; Razbudej, V.F.; Saltykov, L.S.; Starchik, P.D.; Slobodyan, V.M. AN Ukrainskoj SSR, Kiev (Ukraine). Inst. Yadernykh Issledovanij. 1990. 12p. (In Russian). Order Number DE92627498. Source: OSTI; NTIS (US Sales Only); INIS.

Experiments for the finding of the cold nuclear fusion are described. Investigations have been performed for the Pd samples using different methods of the infusion of deuterium into metal. The different methods of the registration of n, p, γ -emission, T and ^{3}He have been used for the finding of the acts of the deuteron-deuteron fusion. Shock waves generated by an exploding conductors have been applied to the samples. 5 refs.; 6 figs.

20399 (LA-UR--92-826) **Intense diagnostic neutral beam development for ITER.** Rej, D.J. (Oak Ridge National Lab., TN (United States)); Henins, I.; Fonck, R.J.; Kim, Y.J. Los Alamos National Lab., NM (United States). [1992]. 11p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-920362--16: 9. topical conference on high-temperature plasma diagnostics, Santa Fe, NM (United States), 15-19 Mar 1992). Order Number DE92011262. Source: OSTI; NTIS; INIS; GPO Dep.

For the next-generation, burning tokamak plasmas such as ITER, diagnostic neutral beams and beam spectroscopy will continue to be used to determine a variety of plasma parameters such as ion temperature, rotation, fluctuations, impurity content, current density profile, and confined alpha particle density and energy distribution. Present-day low-current, long-pulse beam technology will be unable to provide the required signal intensities because of higher beam attenuation and background bremsstrahlung radiation in these larger, higher-density plasmas. To address this problem, we are developing a short-pulse, intense diagnostic neutral beam. Protons or deuterons are accelerated using magnetic-insulated ion-diode technology, and neutralized in a transient gas cell. A prototype 25-kA, 100-kV, 1-μs accelerator is under construction at Los Alamos. Initial experiments will focus on ITER-related issues of beam energy distribution, current density, pulse length, divergence, propagation, impurity content, reproducibility, and maintenance.

20400 (LA-UR--92-837) **PROPX: An X-ray Manipulation Program.** Kyrala, G.A. Los Alamos National Lab., NM (United States). [1992]. 17p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-920362--15: 9. topical conference on high-temperature plasma diagnostics, Santa Fe, NM (United States), 15-19 Mar 1992). Order Number DE92011264. Source: OSTI; NTIS; GPO Dep.

An interactive micro-computer program that performs some manipulations on an input x-ray spectrum is introduced and described. The program is used to calculate the effect of absorption of filters, transmission through fibers, responsivity of photocathodes, responsivity of absorptive detectors, folding of responses, plotting of cross sections, and calculation, as a function of electron temperature, of the response due to a bremsstrahlung spectrum. Fluorescence from the targets is not included. Two different x-ray libraries are offered, one covers the x-ray range 30--10,000 eV with 288 energy points, and the other covers the energy range 10 eV to 1 MeV with 250 energy points per decade. 7 refs.

20401 (LA-UR--92-903) **Calibration of scintillation detectors for MeV charged fusion products.** Tuszewski, M. (Los Alamos National Lab., NM (United States)); Zweben, S.J. Los Alamos National Lab., NM (United States). [1991]. 15p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-920362--17: 9. topical conference on high-temperature plasma diagnostics, Santa Fe, NM (United States), 15-19 Mar 1992). Order Number DE92011135. Source: OSTI; NTIS; INIS; GPO Dep.

The light output of ZnS scintillators used to detect escaping fusion products in the TFTR Tokamak is studied with 3.5 MeV alpha and 3 MeV proton beams. The emitted light first increases linearly with beam current and then saturates. In all cases investigated, the onset of the saturation corresponds to a power of about 1 mW absorbed within the ZnS powder. The scintillators have adequate time response up to 50--100 kHz.

20402 (LA-UR--92-1043) **Optical diagnostics on dense Z-pinch plasmas.** Riley, R.A. Jr.; Lovberg, R.H.; Shlachter, J.S.; Scudder, D.W. Los Alamos National Lab., NM (United States). [1992]. 15p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-920362--18: 9. topical conference on high-temperature plasma diagnostics, Santa Fe, NM (United States), 15-19 Mar 1992). Order Number DE92011228. Source: OSTI; NTIS; INIS; GPO Dep.

A novel "point-diffraction" interferometer has been implemented on the Los Alamos Solid Fiber Z-Pinch experiment. The laser beam is split into two legs after passing through the plasma. The reference leg is filtered with a pin-hole aperture and recombined with the other leg to form an interferogram. This allows compact mounting of the optics and relative ease of alignment. The Z-Pinch experiment employs a pulsed-power generator that delivers up to 700 KA with a 100ns rise-time through a fiber of deuterium or deuterated polyethylene (CD_n) that is 5-cm long and initially solid with radius $r \approx 15 \mu m$. The interferometer, using a $\Delta t \approx 200$ps pulse from a Nd:YAG laser frequency doubled to $\lambda = 532$nm, measures the electron line density and, assuming azimuthal symmetry, the density as a function of radial and axial position. Calculations predict Faraday rotations of order $\pi/2$ for plasma and current densities that this experiment was designed to produce. The resulting periodic loss of fringes would provide the current density distribution.

20403 (LRP–439/91) **Plasma rotation and radial electric field with a density ramp in an ohmically heated tokamak.** Duval, B.P. (Ecole Polytechnique Federale, Lausanne (Switzerland). Centre de Recherche en Physique des Plasma (CRPP)); Joye, B.; Marchal, B. Ecole Polytechnique Federale, Lausanne (Switzerland). Centre de Recherche en Physique des Plasma (CRPP). Oct 1991. 21p. Order Number DE92627440. Source: OSTI; NTIS (US Sales Only); INIS.

Measurements of toroidal and poloidal rotation of the TCA plasma with Alfven Wave Heating and different levels of gas feed are reported. The temporal evolution of the rotation was inferred from intrinsic spectral lines of CV, CIII and, using injected helium gas, from HeII. The light collection optics and line intensity permitted the evolution of the plasma rotation to be measured with a time resolution of 2ms. The rotation velocities were used to deduce the radial electric field. With Alfven heating there was no observable change of this electric field that could have been responsible for the density rise which is characteristic of the RF experiments on TCA. The behaviour of the plasma rotation with different plasma density ramp rates was investigated. The toroidal rotation was observed to decrease with increasing plasma density. The poloidal rotation was observed to follow the value of the plasma density. With hard gas puffing, changes in the deduced radial electric field were found to coincide with changes in the peaking of the plasma density profile. Finally, with frozen pellet injection, the expected increase in the radial electric field due to the increased plasma density was not observed, which may explain the poorer confinement of the injected particles. Even in an ohmically heated tokamak, the measurement of the plasma rotation and the radial electric field are shown to be strongly related to the confinement. A thorough statistical analysis of the systematic errors is presented and a new and significant source of uncertainty in the experimental technique is identified. (author) 18 figs., 18 refs.

20404 (LRP–442/91) **Study of a cylindrical cavity gyrotron, influence of power reflection and of the oscillation of a travelling mode.** Muggli, P. (Ecole Polytechnique Federale, Lausanne (Switzerland). Centre de Recherche en Physique des Plasma (CRPP)). Ecole Polytechnique Federale, Lausanne (Switzerland). Centre de Recherche en Physique des Plasma (CRPP). Nov 1991. 177p. (In French). Order Number DE92627501. Source: OSTI; NTIS (US Sales Only); INIS.

The quality factor and oscillating mode of a gyrotron cavity are essential parameters to consider when trying to obtain a high power (>500 kW), high efficiency (≈50%) microwave source, which oscillates in a stable manner in the principal mode of the cavity. The study and development of an 8 GHz gyrotron whose resonant cavity is formed by a cylindrical waveguide of slowly varying radius, is undertaken. The study is principally concerned with the phenomena associated with the low quality factor of the TE^{o}_{011} mode of the cavity. (author) figs., tabs., 102 refs.

20405 (LRP–444/91) **Cross-field diffusion quenching by neutral gas injection in a magnetized plasma.** Fasoli, A. (Ecole Polytechnique Federale, Lausanne (Switzerland). Centre de Recherche en Physique des Plasma (CRPP)); Skiff, F.; Good, T.N.; Paris, P.J. Ecole Polytechnique Federale, Lausanne (Switzerland). Centre de Recherche en Physique des Plasma (CRPP). Dec 1991. 18p. Order Number DE92627449. Source: OSTI; NTIS (US Sales Only); INIS.

Cross-field transport of test ions is investigated in a linear Q-machine plasma. Test particles are created and followed in their motion by an optical tagging diagnostic scheme. Direct information on ion diffusivity is obtained from a comparison between the actual tag signal and a simple theoretical simulation. Diffusion is demonstrated to be supported by classical mechanisms. When different noble buffer gases are injected, the plasma reacts in such a way that the diffusivity remains classical but its magnitude is considerably reduced. (author) 9 figs., 15 refs.

20406 (LRP–450/92) **A measurement of hydrogen transport in deuterium discharges using the dynamic response of the effective mass.** Dudok de Wit, T. (Ecole Polytechnique Federale, Lausanne (Switzerland). Centre de Recherche en Physique des Plasma (CRPP)); Duval, B.P.; Joye, B.; Lister, J.B. Ecole Polytechnique Federale, Lausanne (Switzerland). Centre de Recherche en Physique des Plasma (CRPP). Feb 1992. 10p. Order Number DE92627450. Source: OSTI; NTIS (US Sales Only); INIS.

Particle tagging in a tokamak provides an attractive method for studying transport mechanisms. The injection of test particles at the plasma edge and the subsequent measurement of the evolution of their concentration at the centre can be used to quantify the underlying transport mechanisms. This has been carried out on the TCA tokamak by injecting hydrogen into a deuterium discharge, and simultaneously measuring the temporal evolution of the effective mass and the edge ionisation rate. (author) 3 figs., 9 refs.

20407 (LRP–451/92) **The dynamical response of the plasma as a tool for investigating transport mechanisms.** Moret, J.M. (Ecole Polytechnique Federale, Lausanne (Switzerland). Centre de Recherche en Physique des Plasma (CRPP)); Dudok de Wit, T.; Joye, B.; Lister, J.B. Ecole Polytechnique Federale, Lausanne (Switzerland). Centre de Recherche en Physique des Plasma (CRPP). Feb 1992. 39p. Order Number DE92627451. Source: OSTI; NTIS (US Sales Only); INIS.

The dynamical response of the soft X-ray emission profile to different external perturbations - gas feed, impurity injection, RF power, surface loop voltage - has been studied on the TCA tokamak and analysed using the same techniques. The frequency dependence of the response has been exploited to distinguish between the dominant transport processes. Remarkably similar phase response profiles were obtained with the different stimuli; they show a link with the sawtooth activity. The model which most plausibly explains these experimental observations requires diffusive transport with the diffusive coefficient locally modulated by the perturbation. (author) 15 figs., 27 refs.

20408 (NIFS–123) **Relaxed state of energy in incompressible fluid and incompressible MHD fluid.** Kondoh, Yoshiomi (Gunma Univ., Kiryu (Japan). Faculty of Technology). National Inst. for Fusion Science, Nagoya (Japan). Dec 1991. 16p. Order Number DE92514940. Source: OSTI; NTIS (US Sales Only); INIS.

Two examples of application of the general principle to find relaxed states are presented to lead to two new results of the relaxed flow profile given by $\Delta \times u = \kappa u$ in the incompressible viscous fluid and the relaxed state given by $\{ \Delta \times B = \lambda B$ and $\Delta \times u = \kappa u \}$ in the incompressible viscous MHD fluid. The former result suggests that some common phenomena are expected to be observed in the reversed field pinch plasma and in the incompressible viscous fluid. The latter one is expected to have some connections with the field profile of B and the flow pattern of u in the magmas as a result of the earth dynamo. (author).

20409 (PPPL–2836) **Third harmonic generation with ultra-high intensity laser pulses.** Rax, J.M.; Fisch, N.J. Princeton Univ., NJ (United States). Plasma Physics Lab. Apr 1992. 14p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH03073. Order Number DE92013245. Source: OSTI; NTIS; INIS; GPO Dep.

When an intense, plane-polarized, laser pulse interacts with a plasma, the relativistic nonlinearities induce a third harmonic polarization. A phase-locked growth of a third harmonic wave can take place, but the differences between the nonlinear dispersion of the pump and driven waves leads to a rapid unlocking, resulting in a saturation. What becomes third harmonic amplitude oscillations are identified here, and the nonlinear phase velocity and the renormalized electron mass due to plasmon screening are calculated. A simple phase-matching scheme, based on a resonant density modulation, is then proposed and analyzed.

20410 (PPPL–2838) **Compton harmonic resonances, stochastic instabilities, quasilinear diffusion, and collisionless damping with ultra-high intensity laser waves.** Rax, J.M. Princeton Univ., NJ (United States). Plasma Physics Lab. Apr 1992. 35p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH03073. Order Number DE92013247. Source: OSTI; NTIS; INIS; GPO Dep.

The dynamics of electrons in two-dimensional, linearly or circularly polarized, ultra-high intensity (above 10^{18}W/cm^2) laser waves, is investigated. The Compton harmonic resonances are identified as the source of various stochastic instabilities. Both Arnold diffusion and resonance overlap are considered. The quasilinear kinetic equation, describing the evolution of the electron distribution function, is derived, and the associated collisionless damping coefficient is calculated. The implications of these new processes are considered and discussed.

20411 (PPPL–2839) **TSC simulation of ohmic discharges in TFTR.** Jardin, S.C.; Bell, M.G.; Pomphrey, N. Princeton Univ., NJ (United States). Plasma Physics Lab. Apr 1992. 40p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH03073. Order Number DE92013249. Source: OSTI; NTIS; INIS; GPO Dep.

The Tokamak Simulation Code (TSC) has been used to model the time dependence of several ohmic discharges in the TFTR experiment. We have refined the semi-empirical thermal conductivity model and the sawtooth model in TSC so that good agreement is obtained between the simulation and the experiment in electron and ion temperature profiles, and in the current profiles for the entire duration of the discharges. Neoclassical resistivity gives good agreement with the measured surface voltages and rate of poloidal flux consumption.

20412 (PPPL–2840) **Heat transport in PBX-M high β_p plasmas.** LeBlanc, B. (Princeton Univ., NJ (United States). Plasma Physics Lab.); Kaye, S.; Bell, R.; Fishman, H.; Hatcher, R.; Kaita, R.; Kessel, C.; Kugel, H.; Okabayashi, M.; Paul, S.; Sauthoff, N.; Sesnic, S.; Takahashi, H.; Asakura, N.; Duperrex, P.; Gammel, G.Princeton Univ., NJ (United States). Plasma Physics Lab. Apr 1992. 37p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH03073. Order Number DE92013248. Source: OSTI; NTIS; INIS; GPO Dep.

PBX-M high beta poloidal discharges routinely transition into the H-mode regime: typically, a quiescent phase followed by an MHD active phase characterize the H-mode period. An analysis of the energy transport during these phases is conducted using the experimental data and the TRANSP code; effective diffusivities are computed to quantify the energy transport of the thermal component of the plasma. Compared to the L-mode, the quiescent H-phase is characterized by a decrease of the thermal ion energy transport and a flattening of the associated effective diffusivity profile. An error analysis is presented. Enhanced fast-ion losses are observed during the MHD active phase: particles in the lower end of the fast-ion energy spectrum with large perpendicular velocity component are predominantly affected. These losses must be taken into account in the analysis in order to reproduce the measured stored energy and time evolution of the neutron production rate during the MHD active phase.

20413 (SAND–92-0066C) **Analyzing noisy spectral line shapes.** Filuk, A.B.; Bailey, J.E. Sandia National Labs., Albuquerque, NM (United States). [1992]. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-76DP00789. (CONF-920362–10: 9. topical conference on high-temperature plasma diagnostics, Santa Fe, NM (United States), 15-19 Mar 1992). Order Number DE92011153. Source: OSTI; NTIS; GPO Dep.

In many situations it in necessary to analyze spectral line shapes where the data contain significant amounts of noise or statistical fluctuations. Our visible spectroscopy measurements exploring ion diode physics on the PBFA II accelerator typically result in noisy spectra because the harsh environment limits the number of photons collected. The spectral line profiles include contributions from Doppler (T~1-3 keV). Stark (n_e~10^{17} cm^{-3}), and instrument broadening, as well as from Stark shifting (E~3-10 MV/cm) and Zeeman spliting (B~2-10 T). We extract information about the physical parameters (e.g. ion temperature from Doppler broadening) by determining a range of fits that are consistent with the data, including the uncertainty due to the noise. The range of fits is generated by a Monte-Carlo technique. This method effectively distinguishes between actual spectral features and artifacts due to noise. It provides not only estimates of physical parameters, but also their uncertainties. We evaluated the technique over a range of signal-to-noise ratios and found that it works well for our application. 7 refs.

20414 (SAND–92-0189C) **Absolute calibration of a total yield indium activation detector for DD and DT neutrons.** Ruiz, C.L. (Sandia National Labs., Albuquerque, NM (United States)); Leeper, R.J.; Schmidlapp, F.A.; Cooper, G.; Malbrough, D.J. Sandia National Labs., Albuquerque, NM (United States). [1992]. 15p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-76DP00789. (CONF-920362–5: 9. topical conference on high-temperature plasma diagnostics, Santa Fe, NM (United States), 15-19 Mar 1992). Order Number DE92010775. Source: OSTI; NTIS; INIS; GPO Dep.

Progress in Z-pinch experiments at Sandia's Saturn Facility have underscored a need for an absolute yield measurement for DD fusion neutrons. The technique chosen for making this absolute yield measurement was neutron activation of indium metal samples. To calibrate the technique, a 175 keV deuteron beam was allowed to impinge on a 3.0-micron thick erbium deuteride target, producing neutrons through the ^{2}H(d,n)^{3}He fusion reaction. The neutron flux produced at 0 degrees and incident on nominal 5 gram indium samples was determined by the associated particle method. This method employed protons measured from the ^{2}H(d,p)^{3}H reaction to infer the neutron flux produced. After neutron irradiation, the activity of the indium samples was measured with a Ge gamma-ray detector. The total activity of the metastable state ^{115m}In(336.23 keV) was measured, compared with the total incident flux, and a calibration factor determined. For completeness, a calibration factor for DT neutrons from the ^{3}H(d,n)^{4}He fusion reaction was also obtained through the measured activity of the metastable state in ^{114m}In(190.29 keV). The experiment and the measured calibration factors for both reactions are described in the paper.

20415 (SFB-191–12-B3-91) **High energy electron generation in surface wave produced plasmas.** Aliev, Yu.M. (Academy of Sciences, P.N. Lebedev Physical Inst., Moscow (USSR)); Bychenkov, V.Yu.; Maximov, A.V.; Schlueter, H. Bochum Univ. (Germany). Sonderforschungsbereich 191 - Physikalische Grundlagen der Niedertemperaturplasmen. Nov 1991. 20p. Order Number DE92516968. Source: OSTI; NTIS (US Sales Only); INIS.

A theoretical model predicting production of hot electrons in the high frequency field of surface wave produced plasmas is presented. The fast particle generation is caused by the radial component of the surface wave electric field near the boundary of the discharge by mechanisms not considered so far. As a result of acceleration due to the interaction with the surface wave field and due to energy loss by excitation and ionization of atoms in the main volume of the plasma the hot electron tail of the energy distribution funtion is formed. Such distributions are calculated for some simple models of inelastic collisions. Effective temperatures are found. The proposed mechanism of hot electron generation are described for cases where the wave frequency is larger than the electron collision frequency. (orig.).

20416 (TRITA-ALF–91-01) **Progress report 1990/91 of the Division of Fusion Plasma Physics.** Lehnert, B. Royal Inst. of Tech., Stockholm (Sweden). Dept. of Fusion Plasma Physics. Aug 1991. 26p. Order Number DE92628696. Source: OSTI; NTIS (US Sales Only); INIS.

A summary is given of the historical background, research, education and available resources of the Division of Fusion Plasma Physics at the newly established Alfven Laboratory. Experimental and theoretical research is performed, including basic physics of magnetized plasma as well as applications to magnetically confined fusion plasma, and to certain technical and cosmical problems. The major project consists of the 'Extrap' high-beta confinement scheme within which a large experimental facility, EXTRAP T2, is under preparation. This research is performed in terms of extensive international collaboration and commitments, in particular with the European Community (Euratom). The education includes pregraduate and postgraduate teaching, the latter being based on obligatory, optional and extra courses which are connected with the research activities.

20417 (TRITA-ALF–91-02) **M=0 Z-Pinch stability reconsidered.** Scheffel, J. (Royal Inst. of Tech., Stockholm (Sweden). Dept. of Fusion Plasma Physics); Coppins, M. Royal Inst. of Tech., Stockholm (Sweden). Dept. of Fusion Plasma Physics. Aug 1991. 16p. Order Number DE92628706. Source: OSTI; NTIS (US Sales Only); INIS.

The m=0 linear stability of the collisionless, small Larmor radius Z-pinch is examined. By using a generalized form of the energy principle it is shown that a finite pressure external gas can stabilize the pinch. Equilibrium skin currents are always destabilizing. Our results clarify why the gas-embedded pinch and Extrap are m=0 stable, whereas the fibre and compressional pinches are not.

20418 (TRITA-EPP–91-04) **Experimental observations of anomalous potential drops over ion density cavities.** Bohm, M. Royal Inst. of Tech., Stockholm (Sweden). Dept. of Plasma Physics. Aug 1991. 32p. Order Number DE92628702. Source: OSTI; NTIS (US Sales Only); INIS.

Experiments are reported showing the plasma potential response when a step voltage is applied over the plasma column between the two plasma sources in a triple plasma machine. The time resolution is sufficient to resolve potential variations caused essentially by the electron motion, and two independent probe methods are used to obtain this time resolution. Depending on the initial conditions two different responses were observed on the time scale of the electron motion. When the initial ion density varies along the plasma column and has a local minimum (that is, forms an ion density cavity), the applied potential drop becomes distributed over the cavity after a few electron transit times. Later the profile steepens to a double layer on the time scale of the ion motion. The width of the cavity is comparable to the length of the plasma column. When the initial density is axially uniform, most of the potential drop instead concentrates to a narrow region at the low potential end of the plasma column after a few electron transit times. On the time scale of the ion motion this potential drop begins to propagate into the plasma as a double layer. The results obtained are consistent with those from numerical simulations with similar boundary conditions. Further experiments are necessary to get conclusive insight into the voltage supporting capability of an ion density cavity. (au) (34 refs.).

20419 (UCLA/PPG–1200-Vol.2, pp. 5.1-5.57) **Burning-plasma simulations.** Najmabadi, F. (Univ. of California, Los Angeles (United States)); Cooke, P.I.H.; Vold, E.L.; Bathke, C.G.; Miller, R.L.; Werley, K.A.; Kelleher, W.P. California Univ., Los Angeles, CA (United States); General Atomics, San Diego, CA (United States); Los Alamos National Lab., NM (United States); Rensselaer Polytechnic Inst., Troy, NY (United States). Dept. of Nuclear Engineering. 1990. In *The TITAN reversed-field-pinch fusion reactor study. Final report, 1990: Volume 2, TITAN plasma engineering.* 431p. Order Number DE92000140. Source: OSTI; NTIS; INIS.

Extensive studies of the TITAN burning plasma have been performed in order to analyze the plasma behavior and performance (e.g., equilibrium, stability, and transport), and to study key plasma-support systems (e.g., current drive, fueling, impurity control, and particle exhaust). As a whole, these analyses provided detailed descriptions of the burning plasma for all engineering activities and design efforts. The results also provided information to the system analysis activity for improving parametric systems models that were then used to generate new cost-optimized design points for further conceptual design and analysis. The TITAN burning-plasma simulations incorporate the latest understanding and models developed for reversed-field pinches (RFPs), in several cases, new and improved models had to be developed for the TITAN study. Because of the relative lack of theoretical and experimental data bases for RFPs, the sensitivity of the design point to various physics assumptions has also been investigated. The TITAN burning-plasma simulations include analyses of the equilibrium and stability of the TITAN plasma. These equilibrium analyses were performed using a large-aspect-ratio approximation. Two-dimensional equilibrium analysis, however, was also performed to substantiate the accuracy of such an approximation for the TITAN effort. The TITAN plasma operates with a highly radiative core plasma, deliberately doped with xenon impurities, to reduce the heat flux on the divertor plates. Therefore, one-dimensional transport simulations of the TITAN core plasma were performed to study the behavior of highly radiative core plasmas and are reported.

20420 (UCLA/PPG–1200-Vol.2, pp. 7.1-7.41) **Current drive.** Bathke, C.C. (Los Alamos National Lab., NM (United States)); Krakowski, R.A.; Takkuen Mau. California Univ., Los Angeles, CA (United States); General Atomics, San Diego, CA (United States); Los Alamos National Lab., NM (United States); Rensselaer Polytechnic Inst., Troy, NY (United States). Dept. of Nuclear Engineering. 1990. In *The TITAN reversed-field-pinch fusion reactor study. Final report, 1990: Volume 2, TITAN plasma engineering.* 431p. Order Number DE92000140. Source: OSTI; NTIS; INIS.

A number of current-drive options for the RFP have been considered. Although the use of radio-frequency (RF) fast-wave current-drive scheme has not been fully explored for the RFP, the high plasma density and currents relative to those for the tokamak indicate problems with the efficiency of RF current-drive schemes. On the other hand, because of the relaxation processes in RFPs, there is no need to drive the current at the plasma center and some of the issues related to wave penetration may be negated. Bootstrap current is also expected to be low, if such current exists at all in RFPs, since β_θ and $\epsilon = r_p/R_T$ are small relative to the tokamak. The close coupling of poloidal and toroidal currents and magnetic fields that determine the near-minimum-energy states of the RFP offers the possibility of a current-drive method based on magnetic helicity injection because the resistive decay of plasma current can be viewed as a dissipation of magnetic helicity. For the TITAN reactors, helicity injection by the oscillating-field current drive (OFCD) has been selected as the means to sustain the toroidal plasma current. From a theoretical viewpoint, the required physics processes for OFCD in RFPs are identified, several numerical simulations are summarized, and some experimental data on OFCD are also available. An analogue circuit model for OFCD is presented and is used to investigate parametrically the characteristics of the OFCD system for the TITAN reactor. Design points for TITAN-I and TITAN-II are suggested.

20421 (UCRL-CR–107774) **Remote experimental site concept for diagnostic collaborations in fusion.** Casper, T.A. Lawrence Livermore National Lab., CA (United States). Aug 1991. 8p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-910857–9: International School of Plasma Physics Piero Caldirola' diagnostics for contemporary fusion experiments, Varenna (Italy), 27 Aug - 6 sep 1991). Order Number DE92010437. Source: OSTI; NTIS; INIS; GPO Dep.

The next generation of tokamaks, ITER or BPX, will be characterized by an even greater emphasis on joint operation and experimentation. With anticipation of an increased number and diversity of collaborations, especially in the area of diagnostics, we are preparing for such shared facilities by developing a systematic approach to remote, joint physics operation involving experimental teams at several locations. The local area network of computers used for control and data acquisition on present and future experiments can be extended over a wide area network to provide a mechanism for remote operation of subsystems (e.g. diagnostics) required for physics experiments. The technology required for high bandwidth ($\geq$45Mbps) connections between multiple sites either exists or will be available over the next few years. With the rapid development of high performance workstations, network interfaces, distributed computing, and video conferencing, we can proceed with the development of a system of control and analysis sites to provide for consistent, efficient, and continuing collaborations. Early establishment of such sites could also enhance existing joint design and development efforts.

20422 (UCRL-CR–110157) **Annual progress report for the fiscal year 1991 and CUSP catastrophe in advanced two chamber model.** Punjabi, A. (Hampton Univ., VA (United States)). Lawrence Livermore National Lab., CA (United States); Hampton Univ., VA (United States). Jun 1991. 18p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. Order Number DE92011945. Source: OSTI; NTIS; GPO Dep.

This year the research efforts were concentrated on the Advanced Two Chamber Model for DIII-D. We have written two codes ADVTCM1 and ADVTCM2 to solve the equations of this advanced model. Both codes have been tested and debugged. At present, we are studying this model in detail using these two codes. This report discusses this model.

20423 (UCRL-JC–108974) **Fifteen chord FIR polarimetry system on MTX.** Rice, B.W. Lawrence Livermore National Lab., CA (United States). Mar 1992. 13p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-920362–22: 9. topical conference on high-temperature plasma diagnostics, Santa Fe, NM (United States), 15-19 Mar 1992). Order Number DE92011296. Source: OSTI; NTIS; INIS; GPO Dep.

A far-infrared (FIR) polarimeter diagnostic has been added to an existing fifteen chord interferometer on the Microwave Tokamak Experiment (MTX). The polarimeter utilizes a new technique for determination of the Faraday rotation angle based on phase measurements of a rotating polarization ellipse. This technique allows the rotation angle to be determined even in the presence of signal amplitude variations caused by refraction. The implementation of this instrument requires no new detectors and minimal optics, making it quite inexpensive to add on to existing multichord interferometers. The MTX polarimeter has been operating for about a year and has achieved a resolution of $\leq$0.2 degrees with a bandwidth of $\simeq$1 kHz and a chord spacing of 1.5 cm. Typical Faraday rotation angles on MTX are in the range of 5–15 degrees. To obtain the poloidal field, the line-integrated density and Faraday rotation profiles are inverted in a manner consistent with the Grad-Shafranov equilibrium to first order in the inverse aspect-ratio expansion. Profile measurements during normal ohmic operation are presented.

20424 (UCRL-JC–109095) **Woelter x-ray microscope characterization measurements on Nova.** Remington, B.A.; Glendinning, S.G.; Wallace, R.J.; Rothman, S.; Morales, R. Lawrence Livermore National Lab., CA (United States). 6 Apr 1992. 14p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-920362–28: 9. topical conference on high-temperature plasma diagnostics, Santa Fe, NM (United States), 15-19 Mar 1992). Order Number DE92013207. Source: OSTI; NTIS; GPO Dep.

We have made in situ measurement of the spatial resolution function for two sectors of the 22X magnification Woelter x-ray microscope. Our experimental technique using backlit grid shot on the Nova laser and our method of analysis are described.

20425 (UW-CPTC–92-1) **Ideal ballooning stability near an equilibrium magnetic island.** Hegna, C.C.; Callen, J.D. Wisconsin Univ., Madison, WI (United States). Center for Plasma Theory and Computation. Mar 1992. 21p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG02-86ER53218. Order Number DE92011730. Source: OSTI; NTIS; INIS; GPO Dep.

The stability properties of ideal ballooning modes on toroidal flux surfaces near a quasistatic magnetic island is examined. On these surfaces, magnetic field-line trajectories tend to bunch on that part of the magnetic surface closet to the X-point of the magnetic island. Because of this preferential bunching, the stabilizing effect of field-line bending due to magnetic shear can be reduced. Eigenfunctions localized in helical angle near the X-point and in poloidal angle on the bad curvature side of the tokamak are more susceptible to ballooning instability than are modes in corresponding equilibria without the magnetic island. For a slowly growing island, a growing number of flux surfaces located near the separatrix become ballooning unstable. Secondary ballooning instabilities may play a part in the crash phase of sawteeth or macroscopic island dynamics.

20426 (CONF-910460–2-Vugraphs) **Stochastic broadening in the divertor region using the standard map.** Punjabi, A. (Hampton Univ., VA (United States)); Verma, A.; Boozer, A. Hampton Univ., VA (United States). [1991]. 24p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG05-90ER54106 ;FG05-88ER53265. From International Sherwood fusion theory conference; Seattle, WA (United States); 22-24 Apr 1991. Order Number DE92013227. Source: OSTI; NTIS; INIS; GPO Dep.

Although perturbations give a stochastic region about a separatix, it is not clear whether the image of the separatix on the strike plate of a tokamak divertor is broadened or becomes a complicated curve. To address this issue we are using the standard map and a continuous analogy. When the parameter k of the standard map is close to unity, the topology of the double null divertor is faithfully reproduced. To led the trajectories into the separatix region, we start in a region of good surfaces. But, in addition to the standard map we add a small diffusive term to the iteractions. We are studying the width of the region intercepted by the field lines on the equivalent of the divertor strike plates in the limit as the diffusion coefficient goes to zero. We have found that this width is independent of the diffusion coefficient.

20427 (CONF-9105202–, pp. 7, Paper 7) **Directions for computing for experimental fusion research.** Zarnstorff, M.C. (Princeton Univ., NJ (United States)). USDOE Office of Energy Research, Washington, DC (United States). Scientific Computing Staff. [1991]. From 1. energy research power supercomputer users symposium; Gaithersburg, MD (United States); 21-22 May 1991. In *Proceedings of the first energy research power supercomputer users symposium.* 173p. Order Number DE91018877. Source: OSTI; NTIS; INIS.

Computers have become a fundamental tool at all stages of experimental fusion research, and are crucial for engineering design, process control and safety monitoring, data acquisition, data analysis, and group communication. The role of computers in experimental fusion research continues to evolve, and to change the manner of the research itself. Here, the authors will outline the present direction of evolution for two areas: data analysis and group communication. TFTR is taken as an example for discussing the present situation, but most of the perspectives are common to other fusion experiments.

20428 (CONF-9105202–, pp. 6, Paper 19) **Progress development of a numerical tokamak.** Brackbill, J.U. (Los Alamos National Lab., NM (United States)). USDOE Office of Energy Research, Washington, DC (United States). Scientific Computing Staff. [1991]. From 1. energy research power supercomputer users symposium; Gaithersburg, MD (United States); 21-22 May 1991. In *Proceedings of the first energy research power supercomputer users symposium.* 173p. Order Number DE91018877. Source: OSTI; NTIS; INIS.

The development of highly concurrent computers is causing a revolution in numerical modeling. One can now anticipate a time when constraints on computational power are removed. That anticipation motivates the identification of grand challenge problems, those problems which combine significance and generality, and benefit from enormous computing power. Magnetic confinement fusion faces a grand challenge problem that will stimulate the energy and creativity of the entire community of computational physicists. That challenge is the developmental of a numerical model for a Tokamak. The successful modeling of a Tokamak would lead to a better understanding of the operation of these machines. As John Dawson comments, it would give much greater confidence in the predicted machine performance; it would provide the capability to test out their new ideas and machine improvements without committing them to hardware, and it would be a powerful tool for machine builders. Since success with the Tokamak is the principal hope for magnetic fusion in the foreseeable future, real contributions from numerical modeling would be invaluable. There is agreement on certain essential components of Tokamak physics.

The modeling of Tokamaks requires the means to represent complex geometries, long-range interaction of charged particles through electric and magnetic fields, non-equilibrium, plasma phenomena, and the nonlinear interaction of many complex and dissimilar processes. It is clear that no one method can encompass all of the physics of a Tokamak. However, because of the range of plasma conditions encountered in a tokamak, there is reason to believe that plasma simulation using the full kinetic equations has the greatest chance of achieving this goal.

20429 (CONF-9108146–2) **Millimeter wave free electron laser amplifiers: Experiments and designs.** Bidwell, S.W. (Maryland Univ., College Park, MD (United States). Lab. for Plasma Research); Zhang, Z.X.; Antonsen, T.M. Jr.; Bensen, D.M.; Destler, W.W.; Granatstein, V.L.; Lantham, P.E.; Levush, B.; Rodgers, J.; Freund, H.P.; Radack, D.J. Maryland Univ., College Park, MD (United States). Lab. for Plasma Research. [1991]. 3p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG05-87ER52147. From 16. international conference on infrared and millimeter waves; Lausanne (Switzerland); 26-30 Aug 1991. Order Number DE92011813. Source: OSTI; NTIS; INIS; GPO Dep.

Free electron laser amplifies are investigated as sources of high-average-power (1 MW) millimeter to submillimeter wave radiation (200 GHz - 600 GHz) for application to electron cyclotron resonance heating of magnetically confined fusion plasmas. As a stepping-stone to higher frequencies and cw operation a pulsed amplifier ($\tau_{pulse} \simeq 80$ ns) at 98 GHz is being developed. Status is reported on this experiment which investigates linear gain amplification with use of sheet electron beam (transverse cross section = 0.1 cm × 2.0 cm, $V_{beam} = 440$ keV, $I_{beam} \simeq 10$ A) and short-period wiggler ($\ell_w = 0.96$ cm) and with expected output of 140 W. Predictions of gain and efficiency from a 1-D universal formulation are presented. Beam propagation results, with wiggler focusing as a means of sheet beam confinement in both transverse dimensions, through the 54 cm (56 period) pulsed electromagnet wiggler are discussed. Peak wiggler fields of 5.1 kG on-axis have been achieved.

20430 (CONF-920311–Absts.) **Tenth International conference on plasma surface interactions in controlled fusion devices: Program and abstracts.** Sandia National Labs., Albuquerque, NM (United States). [1992]. 290p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-76DP00789. From 10. international conference on plasma-surface interactions in controlled fusion devices; Monterey, CA (United States); 30 Mar - 3 apr 1992. Order Number DE92012142. Source: OSTI; NTIS; INIS; GPO Dep.

This report contains the program and abstracts for the 10th international conference on plasma surface interactions in controlled fusion devices. (LSP).

20431 (CONF-920395–1) **The ORNL point of view on the direction of the US Fusion Program.** Fulkerson, B. Oak Ridge National Lab., TN (United States). [1992]. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. From Fusion energy advisory committee meeting; Princeton, NJ (United States); 18-19 Mar 1992. Order Number DE92011080. Source: OSTI; NTIS; INIS; GPO Dep.

Short communication. THERMONUCLEAR REACTIONS/technology assessment; TOKAMAK DEVICES

20432 (CONF-920417–2) **An overview of remote handling technology in today's fusion experiments.** Burgess, T.W. (Oak Ridge National Lab., TN (United States)); Davis, F.C.; Loesser, G.D.; Walton, G.R. Oak Ridge National Lab., TN (United States). [1992]. 31p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400 ;AC02-76CH03073. From ANS executive conference on remote operations and robotics in the nuclear industry II; Pine Mountain, GA (United States); 5-8 Apr 1992. Order Number DE92011777. Source: OSTI; NTIS; INIS; GPO Dep.

This report contains viewgraphs on the use of remote handling techniques for maintenance in fusion reactors. (LSP)

20433 (CONF-920458–7) **Slow strain rate tensile tests in high temperature water of spectrally tailored irradiated type 316 materials for fusion reactor applications.** Tsukada, T. (Japan Atomic Energy Research Inst., Tokai, Ibaraki (Japan)); Shiba, K.; Nakajima, H.; Bell, G.E.C. Oak Ridge National Lab., TN (United States). [1992]. 15p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. From Corrosion '92 conference and exhibition; Nashville, TN (United States); 27 Apr - 1 may 1992. Order Number DE92011783. Source: OSTI; NTIS; INIS; GPO Dep.

The susceptibility of neutron irradiated type 316 stainless to stress corrosion cracking in oxygenated pure water was investigated by Slow Strain Rate Technique (SSRT). The specimens had been irradiated to 8 dpa in the Oak Ridge Research Reactor (ORR) under fusion spectrally tailored condition to simulate radiation environment expected in the near-term water-cooled fusion reactor at temperatures of 60, 200, 330 and 400°C. SSRT tests were conducted at the same temperatures with irradiation for specimens irradiated at 60 and 200°C and at 300°C for specimens irradiated at 330 and 400°C. Intergranular cracks was observed on the specimens irradiated at higher two temperatures, while the specimens irradiated at lower two techniques showed completely ductile fracture. Crack initiation by transgranular type fracture was observed. On fractured grain facets apparent slip steps formed. Results of the SSRT were compared with those from specimens irradiated under LWR conditions and discussed.

20434 (CONF-920607–5) **A comparison of two three-dimensional shell-element transient electromagnetics codes.** Yugo, J.J.; Williamson, D.E. Oak Ridge National Lab., TN (United States). [1992]. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. From 10. topical meeting on technology of fusion energy; Boston, MA (United States); 7-12 Jun 1992. Order Number DE92010686. Source: OSTI; NTIS; INIS; GPO Dep.

Electromagnetic forces due to eddy currents strongly influence the design of components for the next generation of fusion devices. An effort has been made to benchmark two computer programs used to generate transient electromagnetic loads: SPARK and EddyCuFF. Two simple transient field problems were analyzed, both of which had been previously analyzed by the SPARK code with results recorded in the literature. A third problem that uses an ITER inboard blanket benchmark model was analyzed as well. This problem was driven with a self-consistent, distributed multifilament plasma model generated by an axisymmetric physics code. The benchmark problems showed good agreement between the two shell-element codes. Variations in calculated eddy currents of 1–3% have been found for similar, finely meshed models. A difference of 8% was found in induced current and 20% in force for a coarse mesh and complex, multifilament field driver. Because comparisons were made to results obtained from literature, model preparation and code execution times were not evaluated.

20435 (CONF-920607–9) **Small tokamaks for fusion technology testing.** Peng, Y.K.M.; Galambos, J.D.; Shipe, P.C. Oak Ridge National Lab., TN (United States). [1992]. 10p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. From 10. topical meeting on technology of fusion energy; Boston, MA (United States); 7-12 Jun 1992. Order Number DE92011790. Source: OSTI; NTIS; INIS; GPO Dep.

Small steady-state tokamaks for testing divertors and fusion nuclear technologies are considered. Based on present physics and technology data and explanation to reduce R_0/a, H-D-fueled tokamaks with $R_0 \sim 0.6–0.75$ m, $R_0/a \sim 1.8–2.5$, and $B_{t0} \sim 1.4–2.2$ T can be driven with $P_{tot} \sim 4.5$ MW to maintain $I_p \sim 0.5$ MA and produce the ITER-level plasma edge and divertor conditions. Given an adequate steady-state divertor solution and Q~1 operation based on fusion through the suprathermal component, D-T-fueled tokamaks with $R_0 \sim 0.8$ m, $R_0/a \sim 2$, and $B_{t0} \sim 4$ T can be driven with $P_{tot} \sim 15$ MW to maintain $I_p \sim 4.6$ MA and produce an peak neutron wall load $W_L \sim 1$ MW/m^2. Such devices appear possible if the plasma properties at the power R_0/a remain tokamak-like and, for the D-T case, can unshielded center core is feasible. The use of a single conductor as the inboard leg of the toroidal field coils for this purpose is discussed. The physics issues and the design features are identified for such tokamaks with a testing duty for factor goal of 10–20%.

20436 (CONF-920628-2-Extd.Abst.) **Radiation damage in carbon-carbon composites.** Burchell, T.D.; Eartherly, W.P.; Nelson, G.E. Oak Ridge National Lab., TN (United States). [1992]. 4p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. From International conference on carbon: carbon '92; Essen (Germany); 22-26 Jun 1992. Order Number DE92011778. Source: OSTI; NTIS; INIS; GPO Dep.

Graphite and carbon-carbon composite materials are widely used in plasma facing applications in current Tokamak devices such as TFTR and DIIID in the USA, JET, Tore Supra and TEXTOR in Europe, and JT-60U in Japan. Carbon-carbon composites are attractive choices for Tokamak limiters and diverters because of their low atomic number, high thermal shock resistance, high melting point, and high thermal conductivity. Next generation machines such as the International Thermonuclear Experimental Reactor (ITER) will utilize carbon-carbon composites in their first wall and diverter. ITER will be an ignition machine and thus will produce substantial neutron fluences from the D-T fusion reaction. The resultant high energy neutrons will cause carbon atom displacements in the plasma facing materials which will markedly affect their structure and physical properties. The effect of neutron damage on graphite has been studied for over forty years. Recently the effects of neutron irradiation on the fusion relevant graphite GraphNOL N3M was reviewed. In contrast to graphite, relatively little work has been performed to elucidate the effects of neutron irradiation on carbon-carbon composites. The results of our previous irradiation experiments have been published elsewhere. Here the irradiation induced dimensional changes in 1D, 2D, and 3D carbon-carbon composites are reported for fluences up to 4.7 dpa at an irradiation temperature of 600°C.

20437 (CONF-920673-3-Extd.Abst.) **The effect of neutron irradiation on the structure and properties of carbon-carbon composite materials.** Burchell, T.D.; Eatherly, W.P.; Strizak, J.P. Oak Ridge National Lab., TN (United States). [1992]. 2p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. Short communication. GRAPHITE/damaging neutron fluence; THERMONUCLEAR REACTOR MATERIALS/physical radiation effects; GRAPHITE; DIVERTORS; LIMITERS; TOKAMAK DEVICES

20438 (DOE/DP/40200-188) **LLE review: Quarterly report, October-December 1991: Volume 49.** Keck, R.L. (ed.). Rochester Univ., NY (United States). Lab. for Laser Energetics. [1991]. 65p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FC03-85DP40200. Order Number DE92011614. Source: OSTI; NTIS; GPO Dep.

This volume of the LLE Review, covering the period October-December 1991, contains articles on the analysis of argon-filled target experiments, and a theoretical analysis of the impact of nonlocal heat transport in laser filamentation in plasmas. In the Advanced Technology section there is an article on mechanisms that affect thin-film conductivity, and a report on the gain characteristics of the 20-cm SSA prototype amplifier to be used in the OMEGA Upgrade. Finally, the activities of the National Laser Users Facility and the GDL and OMEGA laser facilities are summarized. Highlights of the research reported in this issue are: argon radiation from argon-filled, polymer-shell targets is used as a core-temperature diagnostic and density diagnostic of the surrounding region in a regime where the argon line radiation is strongly absorbed. A theoretical analysis of the impact of nonlocal heat transport on laser filamentation in plasmas is developed. The resulting model is compared with experimental observations and the implications for ICF are discussed. A study of thermal conductivity in thin films seeks to identify mechanisms that result in degradation of thin-film conductivity. Identifying these mechanisms can lead to changes in the thin-film manufacture that will improve their resistance to laser damage.

20439 (DOE/ER/52147-5) **Microwave generation for magnetic fusion energy applications: Progress report, September 15, 1991-July 15, 1992.** Antonsen, T.M. Jr.; Destler, W.W.; Granatstein, V.L.; Levush, B. Maryland Univ., College Park, MD (United States). Jan 1992. 45p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG05-87ER52147. Order Number DE92011424. Source: OSTI; NTIS; INIS; GPO Dep.

This progress report encompasses work on two separate projects, both related to developing sources for electron cyclotron resonance heating of magnetic fusion plasmas. The report is therefore divided into two parts as follows: Free electron laser with small period wigglers; and theory and modeling of high frequency, high power gryotron operation. Task A is experimental and eventually aims at developing continuously tunable, cw sources for ECRH with power per unit as high as 5 megawatts. Task B provides gryotron theory and modeling in support of the gryotron development programs at MIT and Varian.

20440 (DOE/ER/54091-1) **Boundary plasma transport studies on TFTR: Final report, September 1990-September 1991.** Pitcher, C.S.; Stangeby, P.C. Canadian Fusion Fuels Technology Project, Mississauga, ON (Canada). Nov 1991. 56p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG05-90ER54091. (CFFTP-G-91112). Order Number DE92011942. Source: OSTI; NTIS; INIS; GPO Dep.

In this report we summarize the experimental and theoretical investigations supported under the DOE Transport Initiative Contract on the subject of Boundary Plasma Transport Studies on TFTR. This work can be logically separated into two areas of investigations and therefore the report included here is divided into two parts. First, in Section I, detailed boundary plasma data obtained from TFTR in an Ohmic density scan has been compared with results from the LIM Impurity Production and Transport Code. Second, in Section II, experimental results taken with the newly-purchased (specifically for this Initiative) intensified CCD camera are presented, which, after comparison with simple modeling, reveals a new and important effect that has implications for limiter and divertor plate design.

20441 (EGG-FSP-9865) **A comparison of dose and dose-rate conversion factors from the Soviet Union, United Kingdom, US Department of Energy, and the Idaho National Engineering Laboratory Fusion Safety Program.** Rood, A.S.; Abbott, M.L. EG and G Idaho, Inc., Idaho Falls, ID (United States). Dec 1991. 148p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC07-76ID01570. Order Number DE92012221. Source: OSTI; NTIS; INIS; GPO Dep.

Several independent data sets of radiological dose and dose-rate conversion factors (DCF/DRCF) have been tabulated or developed by the international community both for fission and fusion safety purposes. This report compares sets from the US Department of Energy, the Soviet Union, and the United Kingdom with those calculated by the Idaho National Engineering Laboratory Fusion Safety Program. The objectives were to identify trends and potential outlying values for specific radionuclides and contribute to a future benchmark evaluation of the CARR computer code. Fifty-year committed effective dose equivalent factors were compared for the inhalation and ingestion pathways. External effective dose equivalent rates were compared for the air immersion and ground surface exposure pathways. Comparisons were made by dividing dose factors in the different data bases by the values in the FSP data base. Differences in DCF/DRCF values less than a factor of 2 were considered to be in good agreement and are likely due to the use of slightly different decay data, variations in the number of organs considered for calculating CEDE, and rounding errors. DCF/DRCF values that differed by greater than a factor of 10 were considered to be significant. These differences are attributed primarily to the use of different radionuclide decay data, selection and nomenclature for different isomeric states, treatment of progeny radionuclides, differences in calculational methodology, and assumptions on a radionuclide's chemical form.

20442 (EGG-FSP-9977) **Magnet operating experience review for fusion applications.** Cadwallader, L.C. EG and G Idaho, Inc., Idaho Falls, ID (United States). Nov 1991. 99p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC07-76ID01570. Order Number DE92012531. Source: OSTI; NTIS; INIS; GPO Dep.

This report presents a review of magnet operating experiences for normal-conducting and superconducting magnets from fusion, particle accelerator, medical technology, and magnetohydrodynamics research areas. Safety relevant magnet operating experiences are presented to provide feedback on field performance of existing designs and to point out the operational safety concerns. Quantitative estimates of magnet component failure rates and accident event frequencies are also presented, based on field experience and on performance of similar components in other industries.

20443 (EGG-FSP–10017) **Beryllium technology workshop, Clearwater Beach, Florida, November 20, 1991.** Longhurst, G.R. EG and G Idaho, Inc., Idaho Falls, ID (United States). Dec 1991. 239p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC07-76ID01570. (CONF-9111209–: Beryllium technology workshop, Clearwater Beach, FL (United States), 20 Nov 1991). Order Number DE92012312. Source: OSTI; NTIS; INIS; GPO Dep.

This report discusses the following topics: beryllium in the ITER blanket; mechanical testing of irradiated beryllium; tritium release measurements on irradiated beryllium; beryllium needs for plasma-facing components; thermal conductivity of plasma sprayed beryllium; beryllium research at the INEL; Japanese beryllium research activities for in-pile mockup tests on ITER; a study of beryllium bonding of copper alloy; new production technologies; thermophysical properties of a new ingot metallurgy beryllium product line; implications of beryllium:steam interactions in fusion reactors; and a test program for irradiation embrittlement of beryllium at JET.

20444 (EGG-FSP–10048) **Cryogenic system operating experience review for fusion applications.** Cadwallader, L.C. EG and G Idaho, Inc., Idaho Falls, ID (United States). Jan 1992. 102p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC07-76ID01570. Order Number DE92012509. Source: OSTI; NTIS; INIS; GPO Dep.

This report presents a review of cryogenic system operating experiences, from particle accelerator, fusion experiment, space research, and other applications. Safety relevant operating experiences and accident information are discussed. Quantitative order-of-magnitude estimates of cryogenic component failure rates and accident initiating event frequencies are presented for use in risk assessment, reliability, and availability studies. Safety concerns with cryogenic systems are discussed, including ozone formation, effects of spills, and modeling spill behavior. This information should be useful to fusion system designers and safety analysts, such as the team working on the International Thermonuclear Experimental Reactor design.

20445 (ENEA-RT-INN–90-35) **1st ENEA report on extreme UV single pass high gain free electron laser driven by self triggered harmonic generation in oscillator regime. Part 2: general design considerations.** Barbini, R.; Ciocci, F.; Dattoli, G.; Dipace, A.; Giannessi, L.; Mari, C.; Ronsivalle, C.; Sabia, E.; Torre, A.; Marino, A. ENEA, Frascati (Italy). Centro Ricerche Energia - Area Energia e Innovazione; ENEA, Casaccia (Italy). Area Energia e Innovazione; ENEA, Bologna (Italy). Centro Ricerche Energia 'E. Clementel' - Area Energia e Innovazione. May 1991. 39p. (RT/INN–90-35). Order Number DE92506265. Source: OSTI; NTIS (US Sales Only).

This report describes a non conventional FEL consisting of a coupled oscillator and amplifier scheme. This device could extend the FEL tunability below 100 nm. The laser tunability and the high peak power make the system a candidate for the ionization process Bi+ = Bi++, required within the context of inertial fusion projects with ions.

20446 (GA-A–20860) **Real time analysis of tokamak discharge parameters.** Ferron, J.R.; Strait, E.J. General Atomics, San Diego, CA (United States). Mar 1992. 11p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC03-89ER51114. (CONF-920362–20: 9. topical conference on high-temperature plasma diagnostics, Santa Fe, NM (United States), 15-19 Mar 1992). Order Number DE92011394. Source: OSTI; NTIS; INIS; GPO Dep.

The techniques used in implementing two applications of real time analysis of data from the DIII-D tokamak are described. These tasks, which are demanding in both the speed of data acquisition and the speed of computation, execute on hardware capable of acquiring 40 million data samples per second and executing 80 million floating point operations per second. In the first case, a feedback control algorithm executing at a 10 kHz cycle frequency is used to specify the current in the poloidal field coils in order to control the discharge shape. In the second, fast Fourier transforms of Mirnov probe data are used to find the amplitude and frequency of each of eight toroidal mode numbers as a function of time during the discharge. Data sampled continuously at 500 kHz are used to produce results at 2 msec intervals.

20447 (INFN-TC–91-10) **A new scheme for critical current measurements on straight superconducting cables in a large solenoid.** Rossi, L. (Milan Univ. (Italy). Ist. di Fisica); Volpini, G.; Lasa Laboratory. Istituto Nazionale di Fisica Nucleare, Rome (Italy). 1991. 15p. Order Number DE92627507. Source: OSTI; NTIS (US Sales Only); INIS.

The precision of I_c measurement of straight superconducting cables in solenoids can be limited by the magnetic field inhomogeneity. A solution in order to improve the field homogeneity based on iron shims is presented here. A conceptual design for the experimental lay-out of a test station to be used in connection with the SOLEMI-I solenoid at the Milan INFN Section (LASA Laboratory) is given.

20448 (IPP–2/313) **Proceedings of the 4th workshop on WENDELSTEIN 7-X.** Junker, J. (ed.). Max-Planck-Institut fuer Plasmaphysik, Garching (Germany). Dec 1991. 242p. (CONF-9110379–: 4. workshop on WENDELSTEIN 7-X, Schloss Ringberg (Germany), 28-31 Oct 1991). Order Number DE92517002. Source: OSTI; NTIS (US Sales Only); INIS.

The 4th Workshop on WENDELSTEIN 7-x (28.-31.10.1991) treated the following topics: Coil System (optimization; ripple transport; magnetic fields, forces, stresses; analytic stellarator fields) - equilibrium and stability (computations; equilibrium with dissipation; global MHD stability; resistive ballooning modes) - transport and neutral gas (Pfirsch-Schlueter currents and anomalous transport; general solution of the ripple-averaged equation; the EIRENE neutral gas transport codes; application of DEGAS; CX-losses at NBI) - plasma parameters (alpha particle confinement in stellarators; the radical electric field in W 7) - divertor (structure of the magnetic field line diversion in Helias configurations; divertor studies for W 7; sweep coil system; the island divertor; one-dimensional fluid model and investigation of the plasma boundary layer) - engineering (W 7 status of planning; CAD/CAE applications for W 7; structural analysis of the coil system) - reactor (the Helias reactor) - concluding discussion. (AH).

20449 (KFK–4929) **Status report. KfK contribution to the development of DEMO-relevant test blankets for NET/ITER. Pt. 2: BOT helium cooled solid breeder blanket. Vol. 2. Detailed version.** Dalle Donne, M. (comp.) (Internationale Atomreaktorbau GmbH (INTERATOM), Bergisch Gladbach (Germany)); Adelhelm, C.; Baschek, H.D.; Bogusch, E.; Fritsch, W.; Boccaccini, L.V.; Bojarsky, E.; Deckers, H.; Dienst, W.; Doerr, L.; Fischer, U. Kernforschungszentrum Karlsruhe GmbH (Germany). Projekt Kernfusion. Oct 1991. 326p. Order Number DE92511178. Source: OSTI; NTIS (US Sales Only); INIS.

The BOT (Breeder Outside Tube) Helium Cooled Solid Breeder Blanket for a fusion Demo reactor and the status of the R and D program is presented. This is the KfK contribution to the European Program for the Demo relevant test blankets to be irradiated in NET/ITER. Volume 1 (KfK 4928) contains the summary, volume 2 (KfK 4929) a more detailed version of the report. In both volumes are described the reasons for the selected design, the reference blanket design for the Demo reactor, the design of the test blanket including the ancillary systems together with the present status of the relative R and D program in the fields of neutronic and thermohydraulic calculations, of the electromagnetic forces caused by disruptions, of the development and irradiation of the ceramic breeder material, of the tritium release and recovery, and of the technological investigations. An outlook is given on the required R and D program for the BOT Helium Cooled Solid Breeder Blanket prior to tests in NET/ITER and the proposed test program in NET/ITER. (orig.).

20450 (KFK–4958) **Current lead and bus bar system for the 1.8 K test of the EURATOM LCT-coil.** Friesinger, G.; Heller, R.; Schappals, L.; Zahn, G. Kernforschungszentrum Karlsruhe GmbH (Germany). Inst. fuer Technische Physik; Kernforschungszentrum Karlsruhe GmbH (Germany). Projekt Kernfusion. Nov 1991. 46p. Order Number DE92511417. Source: OSTI; NTIS (US Sales Only); INIS.

For the test of EURATOM LCT coil at 1.8 K in the TOSKA facility, it is foreseen to use the 23 kA current leds developed for the POLO model coil. Special emphasis has been given to the connection of the current leads which will operate by using supercritical helium at 4.2 K to the coil terminals which are on the 1.8 K level. The heat input from the bus bar system (4.2 K) to the coil winding cooling circiut (1.8 K) for each terminal is only in the range of 10 to 15 W. The calculations show that the current leads together with the superconducting connection bars are safe: They can withstand a loss of mass flow for more than one minute withonly a very small increase of heat load into the coil if its cooling circuit stays in operation. (orig.).

20451 (LA-UR–92-875) **Neutron time-of-flight ion temperature diagnostic for inertial confinement fusion experiments.** Chrien, R.E. (Los Alamos National Lab., NM (United States)); Simmons, D.F.; Holmberg, D.L. Los Alamos National Lab., NM (United States). [1992]. 12p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-920362–19: 9. topical conference on high-temperature plasma diagnostics, Santa Fe, NM (United States), 15-19 Mar 1992). Order Number DE92011365. Source: OSTI; NTIS; INIS; GPO Dep.

We are constructing a T_I diagnostic for low neutron yield (5×10^7 to above 10^9) d-d and d-t targets in the Nova facility at Livermore. The diagnostic measures the neutron energy spread with 960 scintillator-photomultiplier detectors located 28 m from the target and operates in the single-hit mode. Each detector can measure a single neutron arrival with time resolution of 1 ns or better. The arrival time distribution is constructed from the results of typically 200–500 detector measurements. The ion temperature is determined from the spread in neutron energy $\Delta E_n \propto T_I^{\frac{1}{2}}$, which is related to the arrival time spread by $\Delta t/t = 1(\frac{1}{2}\Delta E_n/E_n)$. Each neutron arrival is detected by using a photomultiplier tube to observe the recoil proton from elastic scattering in a fast plastic scintillator. The timing electronics for each channel consist of a novel constant fraction-like discriminator and a multiple hit time-to-digital converter (TDC). The overall system design, together with single channel performance data, is presented.

20452 (LBL–31943) **Heavy ion fusion accelerator research (HIFAR) year-end report, April 1, 1991–September 30, 1991.** Lawrence Berkeley Lab., CA (United States). Sep 1991. 25p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC03-76SF00098. (HIFAN–536). Order Number DE92013762. Source: OSTI; NTIS; INIS; GPO Dep.

This report discusses the following topics: ion source for the final focusing scaling experiment; reference ILSE physics design; injector and ion source development; the injector matching section; beam merging in ILSE; short quadrupole magnet design; ILSE concept induction cell studies; fast split-harp emittance measurements using a multichannel waveform analyzer; and HIFAR staff roster.

20453 (NIFS–122) **Status of LHD control system design.** Yamazaki, K.; Kaneko, H.; Taniguchi, Y.; Motojima, O. National Inst. for Fusion Science, Nagoya (Japan). Dec 1991. 18p. Order Number DE92514939. Source: OSTI; NTIS (US Sales Only); INIS.

The present status of LHD (Large Helical Device) control system design is described, emphasizing on the plasma operation modes, the architecture of the LHD control system, the real-time plasma feedback system with PID or Fuzzy controllers and the construction schedule of the LHD control system. The conceptual and designs are under way taking flexible and reliable operations for physics experiments into account. (author).

20454 (PPPL–2837) **Particle reflection and TFTR neutral beam diagnostics.** Kamperschroer, J.H.; Grisham, L.R.; Kugel, H.W.; O'Connor, T.E.; Newman, R.A.; Stevenson, T.N.; von Halle, A.; Williams, M.D. Princeton Univ., NJ (United States). Plasma Physics Lab. Apr 1992. 16p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH03073. Order Number DE92013246. Source: OSTI; NTIS; INIS; GPO Dep.

Determination of two critical neutral beam parameters, power and divergence, are affected by the reflection of a fraction of the incident energy from the surface of the measuring calorimeter. On the TFTR Neutral Beam Test Stand, greater than 30% of the incident power directed at the target chamber calorimeter was unaccounted for. Most of this loss is believed due to reflection from the surface of the flat calorimeter, which was struck at a near grazing incidence (12°). Beamline calorimeters, of a "V"-shape design, while retaining the beam power, also suffer from reflection effects. Reflection, in this latter case, artificially peaks the power toward the apex of the "V", complicating the fitting technique, and increasing the power density on axis by 10 to 20%; an effect of import to future beamline designers. Agreement is found between measured and expected divergence values, even with 24% of the incident energy reflected.

20455 (PPPL–2841) **Experiments on TFTR supershot plasmas.** Strachan, J.D. (Princeton Univ., NJ (United States). Plasma Physics Lab.); Bell, M.; Janos, A.; Kaye, S.; Kilpatrick, S.; Manos, D.; Mansfield, D.; Mueller, D.; Owens, K; Timberlake, J.; Pitcher, C.S.; Snipes, J. Princeton Univ., NJ (United States). Plasma Physics Lab. May 1992. 32p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH03073. Order Number DE92013638. Source: OSTI; NTIS; INIS; GPO Dep.

Improvements to the TFTR limiter have extended the threshold for carbon blooms (an uncontrolled massive influx of carbon) to greater than 32 MW for 1 sec so that blooms seldom occur in present TFTR Supershot experiments. As a result of the progression from strong blooms to modest blooms to no blooms, improvements in confinement could be correlated with the occurrence of a carbon bloom in the plasma which immediately preceded the supershot. It is speculated that the carbon influx during a carbon bloom results in a limiter surface which has a slightly reduced self=sputtering yield for subsequent discharge. The influence on the supershot plasma seems similar to phenomena obtained by conditioning with lithium pellets.

20456 (PPPL–2842) **Scrape-off layer modeling using coupled plasma and neutral transport codes.** Stotler, D.P. (Princeton Univ., NJ (United States). Plasma Physics Lab.); Coster, D.P.; Ehrdardt, A.B.; Karney, C.F.F.; Petravic, M.; Braams, B.J. Princeton Univ., NJ (United States). Plasma Physics Lab. May 1992. 15p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH03073. Order Number DE92014001. Source: OSTI; NTIS; INIS; GPO Dep.

An effort is made to refine the neutral transport model used in the B2 edge plasma code by coupling it to the DEGAS Monte Carlo code. Results are discussed for a simulation of a high recycling divertor. It appears that on the order of 100 iterations between the two codes are required to achieve a converged solution. However, the amount of computer time used in the DEGAS simulations is large, making complete runs impractical for design purposes. On the other hand, the differences in the resulting plasma parameters when compared to the B2 analytic neutrals model indicate that it would be worthwhile to explore techniques for speeding up the control system of codes.

20457 (PPPL-CFP–2605) **Noble gas pumping by the TFTR graphite limiter.** Ramsey, A.T.; Manos, D.M. Princeton Univ., NJ (United States). Plasma Physics Lab. [1992]. 18p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH03073. (CONF-920311–4: 10. international conference on plasma-surface interactions in controlled fusion devices, Monterey, CA (United States), 30 Mar - 3 apr 1992). Order Number DE92012669. Source: OSTI; NTIS; INIS; GPO Dep.

The TFTR limiter is graphite. It is possible to decrease the amount of D trapped in the limiter by making plasma discharges with gas injected only as a prefill. When the limiter is deuterium depleted well enough by this technique for supershots (with $R_D \sim 0.5 - 0.6$) it pumps noble gases. The effective confinement time $\tau_p{}^*$ ranges from ≤ 1 s for He down to 0.08 s for Kr. These noble gases escape from the limiter slowly after the run. The partial pressure of Ar and Ne decay with time-constants of several hours, and the data for Ar show evidence of two trapping sites.

20458 (PSI–110) **Magnetohydrodynamic research in fusion blanket engineering and metallurgical processing.** Tokuhiro, A. (Paul Scherrer Inst. (PSI), Villigen (Switzerland)). Paul Scherrer Inst. (PSI), Villigen (Switzerland). Nov 1991. 60p. Order Number DE92627510. Source: OSTI; NTIS (US Sales Only); INIS.

A review of recent research activities in liquid metal magnetohydrodynamics (LM-MHDs) is presented in this article. Two major reserach areas are discussed. The first topic involves the thermomechanical design issues in a proposed tokamak fusion reactor. The primary concerns are in the magneto-thermal-hydraulic performance of a self-cooled liquid metal blanket. The second topic involves the application of MHD in material processing in the metallurgical and semiconductor industries. The two representative applications are electromagnetic stirring (EMS) of continuously cast steel and the Czochralski (CZ) method of crystal growth in the presence of a magnetic field. (author) 24 figs., 10 tabs., 136 refs.

20459 (SAND–92-0049C) **Measurement of beam properties and reproducibility on recent PBFA II target shots.** Moats, A.R.; Derzon, M.S.; Johnson, D.J.; Nelson, W.E.; Wenger, D.F.; Pantuso, J.G. Sandia National Labs., Albuquerque, NM (United States). [1992]. 21p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-76DP00789. (CONF-920362–12: 9. topical conference on high-temperature plasma diagnostics, Santa Fe, NM (United States), 15-19 Mar 1992). Order Number DE92011171. Source: OSTI; NTIS; INIS; GPO Dep.

Recent proton experiments on PBFA II used a 2 micron gold foil cone to characterize the ion beam. Using the ion beam images obtained by viewing such foils with time-integrated x-ray pinhole cameras, the beam centroid axial location and azimuthal symmetry have been analyzed for a recent series of target shots. Azimuthal symmetry on the target midplane on individual shots varies from 14%–35%. Averaged over the entire series of shots, inferred intensities on the target midplane vary by 21% to 41% from quadrant to quadrant. The beam profiles and beam reproducibility are vital to the interpretation of the results of these target experiments. A possible correlation between the ion beam full-width-at-half-maximum and the integrated counts from a nuclear activation diagnostic was observed.

20460 (SAND–92-0155C) **An ion movie camera for particle-beam-fusion experiments.** Stygar, W.A.; Mix, L.P.; Leeper, R.J.; Maenchen, J.; Wenger, D.F.; Mattson, C.R.; Muron, D.J. Sandia National Labs., Albuquerque, NM (United States). [1992]. 16p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-76DP00789. (CONF-920362–13: 9. topical conference on high-temperature plasma diagnostics, Santa Fe, NM (United States), 15-19 Mar 1992). Order Number DE92010669. Source: OSTI; NTIS; INIS; GPO Dep.

A camera with 3-ns time resolution – and a continuous (> 100-ns) record length – has been developed to image a 10^{12}-10^{13} W/cm^2 ion beam for inertial-confinement-fusion experiments. A thin gold Rutherford-scattering foil placed in the path of the beam scatters ions into the camera. The foil is in a near-optimized scattering geometry and reduces the beam intensity seven orders of magnitude. The scattered ions are pinhole imaged onto a 2-D array of 39 p-i-n diode detectors. The output of each detector is recorded on a LeCroy 6880 transient-waveform digitizer. The waveforms are analyzed and combined to produce a 39-pixel movie which can be displayed on an image processor to provide, for example, time-resolved horizontal- and vertical-focusing information.

20461 (SAND–92-0156C) **ICF target diagnostics on PBFA II.** Chandler, G.A. (Sandia National Labs., Albuquerque, NM (United States)); Aubert, J.; Bailey, J.; Carlson, A.; Derzon, D.; Derzon, M.; Dukart, R.; Humphreys, R.; Hunter, J.; Johnson, D.J.; Matzen, M.K.; Moats, A.; Olson, R.; Pantuso, J.; Rockett, P.; Ruiz,.Sandia National Labs., Albuquerque, NM (United States). [1992]. 25p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-76DP00789. (CONF-920362–26: 9. topical conference on high-temperature plasma diagnostics, Santa Fe, NM (United States), 15-19 Mar 1992). Order Number DE92012626. Source: OSTI; NTIS; INIS; GPO Dep.

PBFA II is a light-ion fusion accelerator that is presently capable of irradiating a 6-mm-diameter sphere with ~50 kJ of 5.5-MeV protons in ~15 ns. An array of particle and x-ray diagnostics fielded on proton ICF target experiments quantifies the incident particle beam and the subsequent target response. An overview of the ion and target diagnostic setup and capabilities will be given in the context of recent proton beam experiments aimed at studying soft x-ray emission from foam-filled targets and the hydrodynamic response of exploding-pusher targets. Ion beam diagnostics indicate ~100 kilojoules of proton beam energy incident within a 1.2-cm radius of the center of the diode with an azimuthal uniformity which varied between 6–29%. Foam-filled target temperatures of 35 eV and closure velocities of 4 cm/μs were measured.

20462 (SAND–92-8489C) **Power scaling of divertor plasma conditions during H-mode in DIII-D.** Buchenauer, D. (Sandia National Labs., Livermore, CA (United States)); Cuthbertson, J.W.; Hill, D.N.; Klepper, C.; Petrie, T.W. Sandia National Labs., Livermore, CA (United States). [1992]. 16p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-76DR00789. (CONF-920311–5: 10. international conference on plasma-surface interactions in controlled fusion devices, Monterey, CA (United States), 30 Mar - 3 apr 1992). Order Number DE92012148. Source: OSTI; NTIS; INIS; GPO Dep.

An array of fixed Langmuir probes spanning the inner and outer divertor strike points has been used to measure the electron temperature, plasma density, and particle/heat flux profiles of the divertor plasma in DIII-D. We report here on observations made during the steady state phase of high-power neutral-beam heated H-mode plasmas. These data are important for predicting the expected impurity sources and target-plate material lifetimes in future high power tokamaks such as ITER. H-mode plasmas formed with a high divertor neutral pressure in the absence of external gas feed in DIII-D were found to have beneficial consequences in reducing the peak values of divertor electron temperature without loss of core energy confinement. We have observed a steady-state, high density (^{n}pl, d $\cong 10^{14}$ cm^{-3}), moderate temperature (< 50 eV) divertor plasma in DIII-D at ITER-like divertor power levels of 3 MW/m^2. A better understanding of the importance of ion-neutral and charge-exchange collisions may be needed to interpret these results.

20463 (TRITA-ALF–91-03) **Paramagnetism and diamagnetism in EXTRAP.** Tennfors, E. Royal Inst. of Tech., Stockholm (Sweden). Dept. of Fusion Plasma Physics. Oct 1991. 21p. Order Number DE92628721. Source: OSTI; NTIS (US Sales Only); INIS.

Magnetic field profiles measured in Extrap discharges with an imposed axial/toroidal magnetic field are analysed in the present article. In a linear device, Extrap L1, the axial current is driven by an applied electrode voltage. In the toroidal Extrap T1, the toroidal current is induced. Contributions to the current, and addition to that due to the applied voltage, may arise from radial diffusion as well as from dynamo effects like those observed in reversed field pinches. Typical magnetic field profiles are studied here in order to assess these contributions. (12 refs., 14 figs.).

20464 (UCLA/PPG–1200-Vol.2, pp. 2.1-2.79) **Reversed-field pinch as a fusion reactor.** Krakowski, R.A. (Los Alamos National Lab., NM (United States)); Najmabadi, F. California Univ., Los Angeles, CA (United States); General Atomics, San Diego, CA (United States); Los Alamos National Lab., NM (United States); Rensselaer Polytechnic Inst., Troy, NY (United States). Dept. of Nuclear Engineering. 1990. In *The TITAN reversed-field-pinch fusion reactor study. Final report, 1990: Volume 2, TITAN plasma engineering.* 431p. Order Number DE92000140. Source: OSTI; NTIS; INIS.

The TITAN research program is a multi-institutional effort to determine the potential of the reversed-field-pinch (RFP) magnetic fusion concept as a compact, high-power-density, and attractive fusion energy system from economics safety, environmental, and operational viewpoints. The RFP has inherent characteristics which allow it to operate at very high mass power densities. This potential is available because the main confining field in an RFP is the poloidal field, which is generated by the large toroidal current flowing in the plasma. This feature results in a low field at the external magnet coils, a high plasma beta, and a very high engineering beta as compared to other confinement schemes. Furthermore, sufficiently low magnetic fields at the external coils permit the use of normal coils while joule losses remain a small fraction of the plant output. This option allows a thinner blanket and shield. In addition, the high current density in the plasma allows ohmic heating to ignition, eliminating the need for auxiliary heating equipment. The RFP confinement concept allows arbitrary aspect ratios, and the circular cross sections of plasma eliminates the need for plasma shaping coils, Lastly, the higher plasma densities particularly at the edge, together with operation with a highly radiative RFP plasma, significantly reduce the divertor heat flux and erosion problems. In this section, the theoretical principles and understanding of the RFP confinement scheme are described, emphasizing those features that are relevant to a fusion reactor.

20465 (UCLA/PPG–1200-Vol.2, pp. 3.1-3.68) **Parametric systems studies and design-point selection.** Miller, R.L. (Los Alamos National Lab., NM (United States)); Krakowski, R.A. California Univ., Los Angeles, CA (United States); General Atomics, San Diego, CA (United States); Los Alamos National Lab., NM (United States); Rensselaer Polytechnic Inst., Troy, NY (United States). Dept. of Nuclear Engineering. 1990. In *The TITAN reversed-field-pinch fusion reactor study. Final report, 1990: Volume 2, TITAN plasma engineering.* 431p. Order Number DE92000140. Source: OSTI; NTIS; INIS.

The objective of the systems analysis activity is the systematic study and determination of plant operating parameters through economic analysis and optimization of the power station, emphasizing the performance of the fusion power core. The fusion power core (FPC) includes the plasma chamber, first wall, blanket, shield, coils, and associated structure. The reference design points are chosen to meet overall design goals of the TITAN study such as minimal cost of electricity (COE) and high mass power density (MPD). In addition to the reference design points, trade-off and sensitivity studies were performed to establish and characterize the design window for attractive RFP reactor operation. A parametric systems analysis (PSA) computer code is used for this study. This code was originally developed for use in the Los Alamos compact reversed-field pinch reactor (CRFPR) studied, and the cost data base was updated in the course of the Los Alamos modular stellarator reactor, MSR and spherical torus reactor, ATR/ST studies. Code models include steady-state surveys designed to assess sensitivities and trade-offs related to various TITAN operating configurations and assumptions. These models are benchmarked and calibrated against more detailed plasma physics and magnetics models to provide a framework for the overall design process.

20466 (UCLA/PPG–1200-Vol.2, pp. 4.1-4.64) **Magnetics.** Bathke, C.G. (Los Alamos National Lab., NM (United States)); Duggan, W.P.; Kelleher, W.P.; Steiner, D.; Najmabadi, F. California Univ., Los Angeles, CA (United States); General Atomics, San Diego, CA (United States); Los Alamos National Lab., NM (United States); Rensselaer Polytechnic Inst., Troy, NY (United States). Dept. of Nuclear Engineering. 1990. In *The TITAN reversed-field-pinch fusion reactor study. Final report, 1990: Volume 2, TITAN plasma engineering.* 431p. Order Number DE92000140. Source: OSTI; NTIS; INIS.

The design points for the TITAN reversed-field-pinch (RFP) reactors were generated with the parametric systems model. The parametric systems analysis (PSA) model uses a simplified description of the magnet configuration to estimate the magnet performance as characterized by the coil positions, masses and ohmic losses. To advance the reactor design from the PSA level, the magnet design must be considered in more detail using the models described here. The magnet configuration consists of the following sets of coils: toroidal-field (TF), divertor-field (DF), and poloidal-field (PF) coils. The TITAN reactors operate at steady state using the oscillating-field current-drive (OFCD) system. Rather than using a separate coil set to sustain the toroidal plasma current of $I_\phi \simeq$ 18 MA, the TF, DF, and PF coils are oscillated about their steady-state currents and used as the OFCD driver coils. In addition, the TF coils provide the initial bias field, $B_{\phi o}$, on which the initial RFP configuration is formed. These coils subsequently maintain the external reversed field, $B_{\phi R}$, with a minimum ripple, $\Delta B_R/B_\phi$, at the plasma edge.

20467 (UCLA/PPG–1200-Vol.2, pp. 6.1-6.66) **Plasma transient operations.** Najmabadi, F. (Univ. of California, Los Angeles (United States)); Yuhyi Chu; Bathke, C.G.; Krakowski, R.A.; Miller, R.L. California Univ., Los Angeles, CA (United States); General Atomics, San Diego, CA (United States); Los Alamos National Lab., NM (United States); Rensselaer Polytechnic Inst., Troy, NY (United States). Dept. of Nuclear Engineering. 1990. In *The TITAN reversed-field-pinch fusion reactor study. Final report, 1990: Volume 2, TITAN plasma engineering.* 431p. Order Number DE92000140. Source: OSTI; NTIS; INIS.

A typical reversed-field-pinch (RFP) experimental discharge can be divided into four phases: (1) breakdown and formation, (2) current ramp-up, (3) sustainment, and (4) termination. Ignition and fusion burn in a reactor are achieved during the current ramp-up phase, and operation of the current-drive system is required during the sustainment phase. The breakdown and formation phase encompasses the time from the start, which begins by establishing a toroidal magnetic field inside the discharge chamber in the absence of the plasma, to the formation of a seed RFP plasma. At the time of peak toroidal magnetic field, poloidal-field windings are activated to produce a flux change through the center of the torus and, consequently, a toroidal voltage around the discharge chamber. This voltage typically ionizes the gas in few microseconds and the toroidal current is initiated in the resulting plasma. The toroidal plasma current and the toroidal magnetic field within the plasma increase while the toroidal magnetic field a the wall decreases, keeping the average toroidal field (and the toroidal flux) in the chamber almost constant. Eventually the toroidal magnetic field at the wall changes sign and is crowbarred in the reverse direction relative to the back-biased condition of the breakdown and formation phase. This paper reviews the existing RPF experimental data base for RFP formation and start-up, which is then applied to the TITAN designs. The ignition requirements for ohmically heated RFPs are studied in order to identify the optimum path for TITAN start-up. Using the TITAN seed RFP conditions, a 0-D, profile-averaged plasma-circuit code is used to simulate the evolution of the TITAN plasma through current ramp, ignition, and burn transients.

20468 (UCLA/PPG–1200-Vol.2, pp. 8.1-8.56) **Physics issues for compact reversed-field-pinch reactors.** Krakowski, R.A. (Los Alamos National Lab., NM (United States)); Najmabadi, F. California Univ., Los Angeles, CA (United States); General Atomics, San Diego, CA (United States); Los Alamos National Lab., NM (United States); Rensselaer Polytechnic Inst., Troy, NY (United States). Dept. of Nuclear Engineering. 1990. In *The TITAN reversed-field-pinch fusion reactor study. Final report, 1990: Volume 2, TITAN plasma engineering.* 431p. Order Number DE92000140. Source: OSTI; NTIS; INIS.

The performance projected for the TITAN reactor designs depends crucially on the physics areas described in this paper. Given below are the key physics issues for the high-power-density RFP reactors and recommendations to the RFP experimental physics program. (1) Confinement: Determine spatially resolved profiles in non-transitory RFPs in order to resolve the scaling of intrinsic energy confinement time with plasma geometry, current or current density, and F-Θ value in hot plasmas with low values of $\xi = \upsilon_D/\upsilon_{THe}$ and Z_{eff}. (2) Current drive: Investigate both DC and AC techniques for helicity injection in hot RFPs with separatrices and minimal modulation-induced plasma-wall interaction. Other means of current drive should also be investigated. (3) Impurity control: Emphasize plasma operation with a toroidal-field separatrix in order to minimize plasma-wall interaction in a highly radiating plasma, eventually leading to high-recycling divertor operation and an easing of OFCD with a fixed separatrix position. (4) Formation and start-up: Clearly resolve the scaling of plasma resistance with current ramp rate, current, geometry, and F-Θ values in plasmas with low values of electron streaming parameters, and minimal and/or controllable plasma-wall interactions. Finally, current termination is a safety and economics concern because of the large magnetic stored energy in the TITAN plasma. Experimental techniques for control of current termination and plasma shutdown, leading to a soft-landing, especially by passive means, are essential for achieving a high degree of safety and environmental attractiveness for RFP reactors.

20469 (UCLA/PPG–1200-Vol.3, pp. 10.1-10.154) **TITAN-I fusion-power-core engineering.** Grotz, S.P. (Univ. of California, Los Angeles (United States)); Blanchard, J.P.; Cooke, P.I.H.;

Ghoniem, N.M.; Hasan, M.Z.; Martin, R.C.; Najmabadi, F.; Orient, G.O.; Schultz, K.R.; Sharafat, S.; Cheng, E.T.; Creedon, R.L.; Wong, C.P.C.; Krakowski, R.A.; DCalifornia Univ., Los Angeles, CA (United States); General Atomics, San Diego, CA (United States); Los Alamos National Lab., NM (United States); Rensselaer Polytechnic Inst., Troy, NY (United States). Dept. of Nuclear Engineering. 1990. In *The TITAN reversed-field-pinch fusion reactor study. Final report, 1990: Volume 3, TITAN-1 fusion power core.* 403p. Order Number DE92000139. Source: OSTI; NTIS; INIS.

The TITAN-I reactor is a compact, high-neutron-wall-loading (18 MW/m^2) design. The TITAN-I fusion power core (FPC) is cooled by liquid lithium and uses a vanadium alloy (V-3Ti-1Si) as the structural material. In this section, the detailed engineering design and analysis of the TITAN-I FPC is presented. The FPC components considered here are the reactor torus (including the first wall, blanket, and divertor), hot shielded, and coil sets. The areas of materials, neutronics, thermal and structural design, magnet engineering, and power-cycle analysis are discussed. The emphasis of the TITAN study has been on the investigation and demonstration of the feasibility of the compact, high-power-density reactors and also identification of the critical issues for these devices. Therefore, some of the engineering issues that were not considered crucial to the design were for the most part not covered in detail in this study.

20470 (UCLA/PPG–1200-Vol.3, pp. 11.1-11.45) **TITAN-I divertor engineering.** Cooke, P.I.H. (Univ. of California, Los Angeles (United States)); Blanchard, J.P.; Grotz, S.P.; Hasan, M.Z.; Orient, G.E.; Sharafat, S.; Bathke, C.C.; Cheng, E.T.; Creedon, R.L.; Duggan, W.P. California Univ., Los Angeles, CA (United States); General Atomics, San Diego, CA (United States); Los Alamos National Lab., NM (United States); Rensselaer Polytechnic Inst., Troy, NY (United States). Dept. of Nuclear Engineering. 1990. In *The TITAN reversed-field-pinch fusion reactor study. Volume 3, TITAN-I fusion power core: Final report.* 403p. Order Number DE92000139. Source: OSTI; NTIS; INIS.

This section describes the engineering design of the divertor of the TITAN-I, including the thermal and mechanical design of the divertor components, materials selection, and fabrication issues. Toroidal-field divertors are selected as the impurity-control and particle-exhaust system of TITAN reactors. The design of the impurity-control system poses some of the most severe problems of any component of a DT fusion reactor. For TITAN the divertor design probably represents the most critical engineering and physics issue for the reactor. The two main design issues for the divertor system are to achieve heat loadings on the divertor collector plate (or target) that do not exceed the maximum acceptable level, while simultaneously ensuring that the sputtering erosion rate does not lead to an early failure of the component. These two aims tend to conflict, because the high heat loadings which inevitably occur on the divertor target require the use of thin structures to minimize temperature differences and thermal stresses, while a thick structure is necessary to give a long life against erosion.

20471 (UCLA/PPG–1200-Vol.3, pp. 12.1-12.29) **TITAN-I tritium systems.** Daikai Sze (Argonne National Lab., IL (United States)); Bartlit, J.R.; Martin, R.C. California Univ., Los Angeles, CA (United States); General Atomics, San Diego, CA (United States); Los Alamos National Lab., NM (United States); Rensselaer Polytechnic Inst., Troy, NY (United States). Dept. of Nuclear Engineering. 1990. In *The TITAN reversed-field-pinch fusion reactor study. Volume 3, TITAN-I fusion power core: Final report.* 403p. Order Number DE92000139. Source: OSTI; NTIS; INIS.

The major units in the tritium system of a fusion reactor are: (1) the blanket tritium-recovery system, (2) plasma-exhaust processing system, (3) the fuel-processing and safety systems. The complete tritium system has to be designed under the constraints of tritium inventory, system cost, and tritium leakage rate. Significant relaxation of any one of the constraints will have a major impact on the overall design of the complete system. The blanket tritium systems are discussed, including estimates of tritium diffusion and inventory in the fusion power core (FPC) and the description of the molten-salt recovery system chosen for the TITAN-I design. Fuel-processing and tritium-cleanup and safety-related systems are discussed. Results and conclusion are summarized.

20472 (UCLA/PPG–1200-Vol.3, pp. 13.1-13.50) **TITAN-I safety design and radioactive-waste disposal.** Wong, C.P.C. (General Atomics, San Diego, CA (United States)); Cheng, E.T.; Creedon, R.L.; Hoot, C.G.; Schultz, K.R.; Grotz, S.P.; Blanchard, J.P.; Conn, R.W.; Najmabadi, F.; Sharafat, S. California Univ., Los Angeles, CA (United States); General Atomics, San Diego, CA (United States); Los Alamos National Lab., NM (United States); Rensselaer Polytechnic Inst., Troy, NY (United States). Dept. of Nuclear Engineering. 1990. In *The TITAN reversed-field-pinch fusion reactor study. Volume 3, TITAN-I fusion power core: Final report.* 403p. Order Number DE92000139. Source: OSTI; NTIS; INIS.

Strong emphasis has been given to safety engineering in the TITAN study. Instead of add-on safety design and analysis task, the safety activity was incorporated into the process of design selection and integration at the beginning of the study. The safety-design objectives of the TITAN-I design are: (1) to satisfy all safety-design criteria as specified by the Nuclear Regulatory Commission on accidental releases, occupational doses, and routine effluents and (2) to aim for the best possible level of passive safety assurance. The safety design and evaluations of the TITAN-I reactor are presented. The safety design goals for the TITAN reactors are discussed and the safety-design features are reviewed. Safety analyses for the TITAN-I design are reported for loss-of-flow and loss-of-coolant accidents in the fusion power core, for lithium fires, and for plasma-related accidents. The radioactive-waste-disposal issues and ratings for the TITAN-I design are described. A summary of the TITAN-I safety design and analysis is given.

20473 (UCLA/PPG–1200-Vol.3, pp. 14.1-14.16) **TITAN-I maintenance procedures.** Grotz, S.P. (Univ. of California, Los Angeles (United States)); Cooke, P.I.H.; Najmabadi, F.; Creedon, R.L.; Wong, C.P.C.; Duggan, W.P.; Krakowski, R.A. California Univ., Los Angeles, CA (United States); General Atomics, San Diego, CA (United States); Los Alamos National Lab., NM (United States); Rensselaer Polytechnic Inst., Troy, NY (United States). Dept. of Nuclear Engineering. 1990. In *The TITAN reversed-field-pinch fusion reactor study. Volume 3, TITAN-I fusion power core: Final report.* 403p. Order Number DE92000139. Source: OSTI; NTIS; INIS.

The TITAN reactors are compact, high-power-density designs. The small physical size of these reactors permits each design to be made of only a few pieces, allowing a single-piece maintenance approach. Single-piece maintenance refers to a procedure in which all components that must be changed during the scheduled maintenance are replaced as a single unit, although the actual maintenance procedure may involve the movement, storage, and reinstallation of some other reactor components. In TITAN designs, the entire reactor torus is replaced as a single unit during scheduled maintenance. Furthermore, because of the small physical size and mass of the TITAN-I FPC, the maintenance procedures can be carried out through vertical lifts, allowing a much smaller reactor vault. The advantage of using fully toroidal units with vertical lifts for maintenance has been verified in some fusion experiments. In this section, the layout of the main power-plant buildings and the proposed maintenance procedures for the TITAN-I reactor are presented. A comparison of the TITAN-I single-piece maintenance procedure with a modular approach is difficult. Therefore, only those steps that are likely to be different between single-piece and modular approaches have been identified. Pretesting of the reactor torus to full operating condition is one of the potential advantages of the TITAN-I single-piece approach and is discussed.

20474 (UCLA/PPG–1200-Vol.3, pp. 9.1-9.64) **Overview of TITAN-I design.** Najmabadi, F. (Univ. of California, Los Angeles (United States)); Grotz, S.P.; Wong, C.P.C. California Univ., Los Angeles, CA (United States); General Atomics, San Diego, CA (United States); Los Alamos National Lab., NM (United States); Rensselaer Polytechnic Inst., Troy, NY (United States). Dept. of Nuclear Engineering. 1990. In *The TITAN reversed-field-pinch fusion reactor study. Volume 3, TITAN-I fusion power core: Final report.* 403p. Order Number DE92000139. Source: OSTI; NTIS; INIS.

The key engineering issues for the TITAN-I FPC are discussed. In the area of materials, more data on irradiation behavior of V-3Ti-1Si, especially irradiation-induced swelling, are needed to confirm the materials prediction and to estimate accurately the lifetime of the TITAN-I first wall Further creep-rupture experiments are also needed to develop more precise creep-rupture models for V-3Ti-1Si. The low value of the toroidal field in the RFP allows high coolant velocities to be achieved without prohibitive MHD pressure drops, thus permitting operation in the turbulent-flow regime, with the associated high heat-transfer coefficients. Further experimental data on turbulent-flow heat-transfer capability of liquid metals, especially in the TITAN-relevant operational regime of low magnetic field and high velocities, are crucial to verify the TITAN-I thermal-hydraulic design. The TITAN-I poloidal-field-coil system requires little or no extrapolation of current technology. But, the TITAN-I TF and divertor IBC design encounters several critical engineering issues. The design of the impurity-control system poses some of the most severe problems of any component of a DT fusion reactor, and for a compact or high-power-density design these problems can be particularly challenging. The TITAN-I molten-salt tritium-recovery process needs large-scale demonstration. Any fusion reactor with vanadium first walls may encounter the problem of plasma-driven permeation (PDP) of tritium. The extent of PDP should be experimentally investigated. The TITAN-I design uses many safety-design features to achieve a high level of safety assurance.

20475 (UCLA/PPG–1200-Vol.4, pp. 15.1-15.60) **Overview of TITAN-II design.** Najmabadi, F. (Univ. of California, Los Angeles (United States)); Grotz, S.P.; Wong, C.P.C. California Univ., Los Angeles, CA (United States); General Atomics, San Diego, CA (United States); Los Alamos National Lab., NM (United States); Rensselaer Polytechnic Inst., Troy, NY (United States). Source: OSTI; NTIS; INIS.

The TITAN research program is a multi-institutional effort to determine the potential of the reversed-field-pinch (RFP) magnetic fusion concept as a compact, high-power-density, and attractive fusion energy system from economics (cost of electricity, COE), safety, environmental, and operational viewpoints. In recent reactor studies, the compact reactor option has been identified as one approach toward a more affordable and competitive fusion reactor. The main feature of a compact reactor is a fusion power core (FPC) with a mass power density in excess of 100 to 200 kWe/tone. Mass power density (MPD) is defined as the ratio of the net electric power to the mass of the FPC, which includes the plasma chamber, first wall, blanket, shield, magnets, and related structure. To achieve the design objectives of the TITAN study, the program was divided into two phases, each roughly one year in length: the Scoping Phase and the Design Phase. The Design Phase focused on the conceptual engineering design of basic ideas developed during the Scoping Phase with direct input from the parametric systems analysis and with strong emphasis on safety, environmental, and operational (maintenance) issues. Four candidate TITAN FPCs were identified during the Scoping Phase. The lithium-loop design promises excellent thermal performance and is one of the main concepts being developed by the blanket technology program. The water-cooled design promises excellent safety features and uses more developed technologies. The helium-cooled ceramic design offers true inherent safety and excellent thermal performance. The lithium-loop (TITAN-I) and the aqueous loop-in-pool (TITAN-II) concepts were chosen for detailed conceptual design and evaluation in the Design Phase. The choice was based primarily on the capability to operate at high neutron wall load and high surface heat flux.

20476 (UCLA/PPG–1200-Vol.4, pp. 16.1-16.143) **TITAN-II fusion-power-core engineering.** Wong, C.P.C. (General Atomics, San Diego, CA (United States)); Cheng, E.T.; Creedon, R.L.; Schultz, K.R.; Blanchard, J.P.; Cooke, P.I.H.; Ghoniem, N.M.; Grotz, S.P.; Hasan, M.Z.; Martin, R.C.; Najmabadi, F.; Sharafat, S.; Steiner, D.; Daikai Sze; GierszewsCalifornia Univ., Los Angeles, CA (United States); General Atomics, San Diego, CA (United States); Los Alamos National Lab., NM (United States); Rensselaer Polytechnic Inst., Troy, NY (United States). Source: OSTI; NTIS; INIS.

The TITAN-II reactor is a compact, high-neutron-wall-loading (18 MW/m^2) design. The TITAN-II fusion power core (FPC) is cooled by an aqueous lithium-salt solution which also acts as the breeder material. The major feature of the TITAN-II reactor is that the entire primary loop is located at the bottom of a low-temperature, atmospheric-pressure, pure-water pool. Detailed safety analyses shows that the TITAN-II pool can contain the afterheat energy of the FPC and will remain at a low enough temperature so that tritium or other radioactive material in the primary-coolant system will not be released. In this section, the detailed engineering design and analysis of the TITAN-II FPC is presented. The FPC components considered here are the first wall, blanket, shield, and the coil sets. The use of an aqueous solution imposes special constraints on the selection of breeder and structural material because of the corrosion concerns, hydrogen embrittlement and radiolytic effects.

20477 (UCLA/PPG–1200-Vol.4, pp. 17.1-17.30) **TITAN-II divertor engineering.** Cooke, P.I.H. (Univ. of California, Los Angeles (United States)); Blanchard, J.P.; Grotz, S.P.; Hasan, M.Z.; Sharafat, S.; Bathke, C.C.; Creedon, R.L. California Univ., Los Angeles, CA (United States); General Atomics, San Diego, CA (United States); Los Alamos National Lab., NM (United States); Rensselaer Polytechnic Inst., Troy, NY (United States). Dept. of Nuclear Engineering. 1990. In *The TITAN reversed-field-pinch fusion reactor study. Volume 4, TITAN-2 fusion power core: Final report.* 349p. Order Number DE92000138. Source: OSTI; NTIS; INIS.

This section describes the engineering design of the divertor of TITAN-II, including the thermal and mechanical design of the divertor components, materials selection, and fabrication issues. The design of the impurity-control system poses some of the most severe problems of any component of a DT fusion reactor. For TITAN, the divertor design represents the most critical engineering and physics issues for the reactor. The two main design issues for the divertor system are to achieve heat loadings on the divertor collector plate (or target) that do not exceed the maximum acceptable level, while simultaneously ensuring that the sputtering erosion rate does not lead to an early failure of the component. These two aims tend to conflict, because the high heat loadings which inevitably occur on the divertor target require the use of thin structures to minimize temperature differences and thermal stresses, while a thick structure is necessary to give a long life against erosion.

20478 (UCLA/PPG–1200-Vol.4, pp. 18.1-18.28) **TITAN-II tritium systems.** Daikai Sze (Argonne National Lab., IL (United States)); Bartlit, J.R.; Martin, R.C.; Gierszewski, P.J.; Kevton, O.K. California Univ., Los Angeles, CA (United States); General Atomics, San Diego, CA (United States); Los Alamos National Lab., NM (United States); Rensselaer Polytechnic Inst., Troy, NY (United States). Dept. of Nuclear Engineering. 1990. In *The TITAN reversed-field-pinch fusion reactor study. Volume 4, TITAN-2 fusion power core: Final report.* 349p. Order Number DE92000138. Source: OSTI; NTIS; INIS.

In this section, specific tritium-system design issues that relate to the use of the aqueous-salt blanket coolant in TITAN-II are considered. A critical issue is the need to recover and control tritium that is bred directly in the water coolant of the primary heat-transport system. In particular, tritium recovery from water is required on a scale larger than existing water-detritiation systems. However, there is considerable industrial experience with recovery of hydrogen and its isotopes from water, and some relevant processes equipment is used on larger scale in non-tritium applications. The TITAN-II design considers higher tritium levels (50 Ci/kg) in the primary-coolant water relative to previous design studies in order to minimize the cost of water-processing equipment required for tritium recovery. Design features which make this possible are: (1) lower pressure in the primary system resulting from an elevation of the fluid boiling point caused by the addition of the Li salt, (2) possible use of double-walled steam generators, (3) presence of the water pool which captures a large part of the tritiated-water leakage, (4) routine use of welded joints, and (5) removal of tritiated water to safe storage during major maintenance operations. Components leakage rates and air-drier technology are based on CANDU systems performance. The overall tritium-loss rate for the TITAN-II design is estimated at 50 Ci/d. The analysis of the TITAN-II tritium systems is given in the subsequent sections. The tritium flow rates are estimated. The blanket tritium-recovery system, the plasma-exhaust-purification system, and the room-air-cleanup system are discussed.

20479 (UCLA/PPG–1200-Vol.4, pp. 19.1-19.31) **TITAN-II safety design and radioactive-waste disposal.** Wong, C.P.C. (General Atomics, San Diego, CA (United States)); Cheng, E.T.; Schultz, K.R.; Grotz, S.P.; Sharafat, S. California Univ., Los Angeles, CA (United States); General Atomics, San Diego, CA (United States); Los Alamos National Lab., NM (United States); Rensselaer Polytechnic Inst., Troy, NY (United States). Dept. of Nuclear Engineering. 1990. In *The TITAN reversed-field-pinch fusion reactor study. Volume 4, TITAN-2 fusion power core: Final report.* 349p. Order Number DE92000138. Source: OSTI; NTIS; INIS.

Strong emphasis has been given to safety engineering in the TITAN study. Instead of an add-on safety design and analysis task, the safety activity was incorporated into the process of design selection and integration at the beginning of the study. The safety-design objectives of the TITAN-II design are: (1) to satisfy all safety-design criteria as specified by the Nuclear Regulatory Commission on accidental releases, occupational doses, and routine effluents and (2) to aim for the best possible level of passive safety assurance. The safety design and evaluations of the TITAN-II reactor are presented. The safety-design goals for the TITAN reactors are discussed. To achieve a high level of safety assurance, the TITAN-II fusion power core (FPC) is submerged in a pool of low-temperature, low-pressure water. Various safety scenarios and the impact of the water pool are reviewed. Detailed analyses of loss-of-flow and loss-of-coolant accidents in the TITAN-II FPC are reported. Plasma-related accidents and plasma shutdown methods for TITAN-II are similar to those of TITAN-I (Section 13.6) and thus are not repeated here. The radioactive waste-disposal issues and ratings for the TITAN-II design are discussed. A summary of the TITAN-II safety design and analysis is given.

20480 (UCLA/PPG–1200-Vol.4, pp. 20.1-20.14) **TITAN-II maintenance procedures.** Grotz, S.P. (Univ. of California, Los Angeles (United States)); Cooke, P.I.H.; Najmabadi, F.; Creedon, R.L.; Wong, C.P.C.; Krakowski, R.A. California Univ., Los Angeles, CA (United States); General Atomics, San Diego, CA (United States); Los Alamos National Lab., NM (United States); Rensselaer Polytechnic Inst., Troy, NY (United States). Dept. of Nuclear Engineering. 1990. In *The TITAN reversed-field-pinch fusion reactor study. Volume 4, TITAN-2 fusion power core: Final report.* 349p. Order Number DE92000138. Source: OSTI; NTIS; INIS.

The TITAN reactors are compact, high-power-density designs. The small physical size of these reactors permits each design to be made of only a few pieces, allowing a single-piece maintenance approach. Single-piece maintenance refers to a procedure in which all of components that must be changed during the scheduled maintenance are replaced as a single unit, although the actual maintenance procedure may involve the movement, storage, and reinstallation of some other reactor components. In TITAN designs, the entire reactor torus is replaced as a single unit during scheduled maintenance. Furthermore, because of the small physical size and mass of the TITAN-II FPC, the maintenance procedures can be carried out through vertical lifts, allowing a much smaller reactor vault. The advantage of using fully toroidal units with vertical lifts for maintenance has been verified in some fusion experiments. In this section, the layout of the main power-plant buildings and the proposed maintenance procedures for the TITAN-II reactor are presented. A comparison of the TITAN-II single-piece maintenance procedure with a modular approach is difficult because: (1) the TITAN-II fusion power core (FPC) is designed so that the advantages of a single-piece approach are fully utilized and a different design should have been produced to compare and quantify the benefits of single-piece maintenance procedures, (2) little data is available on times that would be required for each step during the maintenance procedure, and (3) data are needed on mean time-to-failure and mean time-to-repair of various components in order to quantify the impact of the maintenance procedure on the overall plant availability. Therefore, only those steps that are likely to be different between single-piece and modular approaches have been identified. Pretesting of the reactor torus to full operating condition is one of the potential advantages of the TITAN-I and TITAN-II single-piece approach.

20481 (UCRL-CR–104380-Rev.1) **Tunable driver for the LLNL FEL experiment: Final report, [1 June 1990–1 June 1991]: Revision 1.** Guss, W.C. (Massachusetts Inst. of Tech., Cambridge, MA (United States). Plasma Fusion Center); Basten, M.A.; Kreischer, K.E.; Temkin, R.J. Lawrence Livermore National Lab., CA (United States); Massachusetts Inst. of Tech., Cambridge, MA (United States). Plasma Fusion Center. Jul 1991. 11p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. Order Number DE92011292. Source: OSTI; NTIS; INIS; GPO Dep.

This report describes main activities undertaken during the period 1 June 1990 to 1 June 1991 by MIT to support the Lawrence Livermore National Laboratory tunable FEL driver project. The goal of this research was to further characterize a tunable microwave source (already identified as a BWO-gyrotron) of moderate output power (10–20 kW). In the 1989 fiscal year, the source was assembled at MIT and initial tests were conducted. Proposed for the fiscal year 1990 were analysis of the previous experimental results, and the performance of new experiments designed to increase the voltage tuning range, the output efficiency, and magnetic field tuning. During the report period the previous experimental results were analyzed and compared to computational results and new components were designed, to make the BWO ready for further experiments. In addition, the BWO-gyrotron was mounted in a new superconducting magnet and initial magnetic field profile measurements were made.

20482 (UCRL-CR–109550) **Blast venting through blanket material in the HYLIFE ICF reactor.** Liu, J.C. (California Univ., Berkeley, CA (United States). Dept. of Nuclear Engineering); Peterson, P.F.; Schrock, V.E. Lawrence Livermore National Lab., CA (United States); California Univ., Berkeley, CA (United States). Dept. of Nuclear Engineering. 10 Mar 1992. 6p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-920607–11: 10. topical meeting on technology of fusion energy, Boston, MA (United States), 7-12 Jun 1992). Order Number DE92011967. Source: OSTI; NTIS; INIS; GPO Dep.

This work presents a numerical study of blast venting through various blanket configurations in the HYLIFE ICF reactor design. The study uses TSUNAMI – a multi-dimensional, high-resolution, shock capturing code – to predict the momentum exchange and gas dynamics for blast venting in complex geometries. In addition, the study presents conservative predictions of wall loading by gas shock and impulse delivered to the protective liquid blanket. Configurations used in the study include both 2700 MJ and 350 MJ fusion yields per pulse for 5 meter and 3 meter radius reactor chambers. For the former, an annular jet array is used for the blanket geometry, while in the latter, both annular jet array as well as slab geometries are used. Results of the study indicate that blast venting and wall loading may be manageable in the HYLIFE-II design by a judicious choice of blanket configuration.

20483 (UCRL-CR–109602) **Toroidal field coil replacement study for the International Thermonuclear Experimental Reactor (ITER).** Lawrence Livermore National Lab., CA (United States); Bechtel Corp., San Francisco, CA (United States). Aug 1991. 251p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (ITER/US–91/EN-ME-1). Order Number DE92013010. Source: OSTI; NTIS; GPO Dep.

The objective of this study is to develop an estimate of the time required to replace a failed toroidal field (TF) coil in the International Thermonuclear Experimental Reactor (ITER). This estimate is based on the current ITER design which resulted from the Conceptual Design Activities began in spring of 1988 and ending in December 1990. Although the TF Coils in ITER are designated permanent components and expected to last the life of the plant, the history of failures of large coils in fusion devices has prompted an assessment of the down time that might be required for replacement of a failed TF coil in ITER. The difficulty of replacement of a TF Coil in ITER is compounded by the large physical size of ITER, and the radiation fields which necessitate the use of remote handling equipment for most maintenance activities. Since 10 out of of 16 TF coils are adjacent to either a Neutral Beam Injector (NBI) port or a remote handling (RH) port, it is probable that a failed TF Coil will be in one of these inconvenient locations. For this study, TF coil number 3 is assumed to fail and its replacement will be evaluated as a typical case. TF coil number 3 is located between a remote handling port (#3) and a port allocated to the lower hybrid (#4).

20484 (UCRL-JC–104099) **Electron accelerators with pulsed power drives.** Barletta, W.A. (Lawrence Livermore National Lab., CA (United States)). Lawrence Livermore National Lab., CA (United States). 8 Jun 1990. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-900603–65: EPAC '90: 2nd European particle accelerator conference ACROPOLIS, Nice (France), 11-16 Jun 1990). Order Number DE92011524. Source: OSTI; NTIS; GPO Dep.

Pulsed power driven accelerators can produce intense beams with diverse characteristics, ranging from extremely high peak power at low repetition rate to high average power with moderate beam current. The continuing development of highly reliable components for linear induction accelerators (LIAs) and free electron lasers (FELs) may enable one to use such accelerators as economical sources of microwave power to drive magnetic fusion reactors and high-gradient rf linacs. More recently, the technology of pulsed power driven accelerators has been extended to allow the acceleration of intense pulses with <5-ns duration.

20485 (UCRL-JC–106802) **Atomic processes, cross sections, and reaction rates necessary for modelling hydrogen-negative-ion sources and identification of optimum H^- current densities.** Hiskes, J.R. Lawrence Livermore National Lab., CA (United States). [1991]. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-910943–5: 4. international conference on ion sources, Bensheim (Germany), 30 Sep - 4 oct 1991). Order Number DE92010438. Source: OSTI; NTIS; INIS; GPO Dep.

The principal electron excitation cross sections for vibrational excitation in a hydrogen discharge are reported. In the first chamber of a two-chamber hydrogen negative-ion-source system subject to the beam-line constraint of a maximum gas pressure, the density of vibrationally excited molecules reaches an asymptote for increasing discharge current or the equivalent fast electron density. Operating near this first-chamber asymptote, there exists a spatially-dependent maximum negative-ion density in the second chamber. With the extraction grid placed at this maximum the optimum performance of a hydrogen-based system is determined. This optimum performance provides a criterion for the selection of differing source types for fusion applications.

20486 (UCRL-JC–109337) **Numerical simulation of the stability in long cable-in-conduit conductors for fusion magnets.** Yeaw, C.T. (Wisconsin Univ., Madison, WI (United States). Dept. of Nuclear Engineering and Engineering Physics); Wong, R.L. Lawrence Livermore National Lab., CA (United States). 5 Mar 1992. 6p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-920607–13: 10. topical meeting on technology of fusion energy, Boston, MA (United States), 7-12 Jun 1992). Order Number DE92012694. Source: OSTI; NTIS; INIS; GPO Dep.

The stability phenomenon is investigated numerically for a quench initiating in a cable-in-conduit conductor (CICC) at a significant distance from the ends. The thermo-hydraulic computer program, CICC, was used. The geometry chosen for this study is a toroidal field (TF) coil for the conceptual design activity (CDA) of the International Thermonuclear Experimental Reactor (ITER). Previous studies of short conductors have shown that convective helium flows, induced by the initiating heat pulse, control the stability of the conductor. The present study of a long conductor exhibits reduced energy margins and the absence of a transition region between the well-cooled and ill-cooled stability regions because the initiating heat pulse has difficulty sustaining a convective flow. The effect of heat-pulse duration and heated length were considered. For short, high-energy heat pulses, high convective and conductive heat-transfer coefficients can only be mismatched for 10 ms. If the heat-pulse energy is spread your 100 ms, the steady-state heat-transfer coefficient is sufficient to stabilize the conductor. Pulse durations between 10 and 100 ms cause a decrease in energy margin. On the other hand, the conductor length heated was found to have only a small effect on stability. 3 refs.

20487 (UCRL-JC–109517) **Low cost, high yield IFE reactors: Revisiting Velikhov's vaporizing blankets.** Logan, B.G. Lawrence Livermore National Lab., CA (United States). 6 Mar 1992. 10p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-920606–16: American Nuclear Society annual meeting, Boston, MA (United States), 7-12 Jun 1992). Order Number DE92011964. Source: OSTI; NTIS; INIS; GPO Dep.

The performance (efficiency and cost) of IFE reactors using MHD conversion is explored for target blanket shells of various materials vaporized and ionized by high fusion yields (5 to 500 GJ). A magnetized, prestressed reactor chamber concept is modeled together with previously developed models for the Compact Fusion Advanced Rankine II (CFARII) MHD Balance-of-Plant (BoP). Using conservative 1-D neutronics models, high fusion yields (20 to 80 GJ) are found necessary to heat Flibe, lithium, and lead-lithium blankets to MHD plasma temperatures, at initial solid thicknesses sufficient to capture most of the fusion yield. Advanced drivers/targets would need to be developed to achieve a "Bang per Buck" figure-of-merit $\gtrsim$ 20 to 40 joules yield per driver $ for this scheme to be competitive with these blanket materials. Alternatively, more realistic neutronics models and better materials such as lithium hydride may lower the minimum required yields substantially. The very low CFARII BoP costs (contributing only 3 mills/kWehr to CoE) allows this type of reactor, given sufficient advances that non-driver costs dominate, to ultimately produce electricity at a much lower cost than any current nuclear plant.

20488 (UCRL-JC–109522) **HYLIFE-II inertial fusion energy power plant design.** Moir, R.W. Lawrence Livermore National Lab., CA (United States). 5 Mar 1992. 12p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-920607–10: 10. topical meeting on technology of fusion energy, Boston, MA (United States), 7-12 Jun 1992). Order Number DE92011965. Source: OSTI; NTIS; INIS; GPO Dep.

The HYLIFE-II inertial fusion power plant design study uses a liquid fall, in the form of jets, to protect the first structural wall from neutron damage, x rays, and blast to provide a 30-y lifetime. HYLIFE-I used liquid lithium. HYLIFE-II avoids the fire hazard of lithium by using a molten salt composed of fluorine, lithium, and beryllium (Li_2BeF_4) called Flibe. Access for heavy-ion beams is provided. Calculations for assumed heavy-ion beam performance show a nominal gain of 70 at 5 MJ producing 350 MJ, about 5.2 times less yield than the 1.8 GJ from a driver energy of 4.5 MJ with gain of 400 for HYLIFE-I. The nominal 1 GWe of power can be maintained by increasing the repetition rate by a factor of about 5.2, from 1.5 to 8 Hz. A higher repetition rate requires faster re-establishment of the jets after a shot, which can be accomplished in part by decreasing the jet fall height and increasing the jet flow velocity. In addition, although not adequately considered for HYLIFE-I, there is liquid splash that must be forcibly cleared because gravity is too slow, at higher repetition rates than 1 Hz. Splash removal is accomplished in the central region by oscillating jet flows. The cost of electricity is estimated to be 0.09 $/kW·h in constant 1988 dollars, about twice that of future coal and light water reactor nuclear power. The driver beam cost is about one-half the total cost, that is, a zero cost driver would give a calculated cost of electricity of 0.045 $/kWh.

20489 (UCRL-JC–109608) **A comparison of results from an edge-plasma model with those from a two-dimensional fluid code.** Barr, W.L. (Lawrence Livermore National Lab., CA (United States)); Bulmer, R.H.; Perkins, L.J.; Cohen, S.A.; Werley, K.A. Lawrence Livermore National Lab., CA (United States). 3 Mar 1992. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-920607–6: 10. topical meeting on technology of fusion energy, Boston, MA (United States), 7-12 Jun 1992). Order Number DE92010718. Source: OSTI; NTIS; INIS; GPO Dep.

We have just completed a comparison of predictions for the scrape-off layer (SOL) plasma, from a physics model with the more accurate ones from a two-dimensional fluid code, the B2 code. The results presented here show rather good agreement on values of plasma temperature in the SOL and of divertor heat load, for a rather wide range of Tokamak sizes and parameters. We are therefore confident that this model will provide a suitable divertor module for both the new ITER systems code, SUPERCODE, and other applications requiring fast but accurate modelling of edge plasma parameters at least within the range of the present benchmarks.

20490 (UCRL-JC–109811) **A "SuperCode" for performing systems analysis of tokamak experiments and reactors.** Haney, S.W. (Lawrence Livermore National Lab., CA (United States)); Barr, W.L.; Crotinger, J.A.; Perkins, L.J.; Solomon, C.J.; Chaniotakis, E.A.; Freidberg, J.P.; Wei, J.; Galambos, J.D.; Mandrekas, J. Lawrence Livermore National Lab., CA (United States). 4 Mar 1992. 16p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-920607–7: 10. topical meeting on technology of fusion energy, Boston, MA (United States), 7-12 Jun 1992). Order Number DE92010719. Source: OSTI; NTIS; INIS; GPO Dep.

A new code, named the "SUPERCODE," has been developed to fill the gap between currently available zero dimensional systems codes and highly sophisticated, multidimensional plasma performance codes. The former are comprehensive in content, fast to execute, but rather simple in terms of the accuracy of the physics and engineering models. The latter contain state-of-the-art plasma physics modelling but are limited in engineering content and time consuming to run. The SUPERCODE upgrades the reliability and accuracy of systems codes by calculating the self consistent 1 1/2 dimensional MHD-transport plasma evolution in a realistic engineering environment. By a combination of variational techniques and careful formation, there is only a modest increase in CPU time over O-D runs, thereby making the SUPERCODE suitable for use as a systems studies tool. In addition, considerable effort has been expended to make the code user- and programming-friendly, as well as operationally flexible, with the hope of encouraging wide usage throughout the fusion community.

20491 (UCRL-JC–109816) **Status and plans for US ITER studies.** Doggett, J.N. Lawrence Livermore National Lab., CA (United States). 6 Mar 1992. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-920607–12: 10. topical meeting on technology of fusion energy, Boston, MA (United States), 7-12 Jun 1992). Order Number DE92011944. Source: OSTI; NTIS; INIS; GPO Dep.

The United States' participation in the International Thermonuclear Experimental Reactor (ITER) began in later 1987 when the initiative to start a cooperative program among the four Parties – the Soviet Union, Japan, the European Community, and the United States – was initiated. Participation then continued through the start of Joint Work in May 1988 until the conclusion of the Conceptual Design Activities (CDA) in December 1990. In the period between the conclusion of the CDA and the agreement to execute the Engineering Design Activities (EDA), the US ITER Home Team continued to do work on the design, executed additional research and development, and participated in the preparations for the EDA. Activities included one major design study on a High-Aspect-Ratio Design and input to the National ITER Technical Review, the ITER Steering Committee – US, Special Working Group 1, and the Fusion Energy Advisory Committee's Panel 1. Research and development was continued in areas of work that were identified as critical-path elements by an international panel chartered by the four ITER Parties near the end of the CDA. I will describe the conclusion of the CDA and the interim US ITER activities and will give an indication of our involvement in the EDA.

99 GENERAL AND MISCELLANEOUS

20492 (CONF-9110367–Summ.) **Sharing our successes: Changing the face of science and mathematics education through teacher-focused partnerships.** Babcock, C. (ed.). California Univ., Berkeley, CA (United States). [1991]. 57p. Sponsored by USDOE, Washington, DC (United States); National Aeronautics and Space Administration, Washington, DC (United States); National Science Foundation, Washington, DC (United States); California Univ., Berkeley, CA (United States); Triangle Coalit DOE Contract AC03-76SF00098. From Changing the face of science and mathematics education through teacher-focused partnerships: sharing our success; Berkeley, CA (United States); 2-4 Oct 1991. Order Number DE92011884. Source: OSTI; NTIS; GPO Dep.

The Industry Initiatives for Science and Math Education (IISME) program, founded six years ago, is among those of which we are most proud, because of its success. IISME has identified 70 different scientific work experience programs for science and math teachers in 31 states and the District of Columbia. Approximately 45 of the IISME programs in this country are industry-based; 21 are part of the DOE-sponsored Teacher Research Associate (TRAC) Program; the remainder are university-based. Of the 70 known programs nationwide, nearly 40 are represented here today. Teachers work side by side with an industry mentor, then return to the classroom with renewed enthusiasm, firsthand experience with new technologies, and an improved understanding of industry's workforce needs and information about science careers to share with their students. This conference provided a forum for the interaction of K–12 teachers for information sharing about their programs of alliances and their plans to improve science education.

20493 (NEA/NEACRP/R–91-2) **Reactor physics activities in NEA member countries October 1990-September 1991.** Nuclear Energy Agency, 75 - Paris (France). 1991. 162p. Order Number DE92517872. Source: OSTI; NTIS (US Sales Only); INIS.

This document is a compilation of National Activity Reports presented at the Thirty-Fourth Meeting of the NEA Committee on Reactor Physics, held at the Paul Scherrer Institute, Wuerenlingen, Switzerland, from 3rd-5th September 1991.

9901 Management

20494 (AECL–10196) **Progress report - physics and health sciences - physics section 1990 January 01 - June 30.** Hardy, J.C. (ed.). Atomic Energy of Canada Ltd., Chalk River, ON (Canada). Chalk River Nuclear Labs. Oct 1990. 182p. (PR-PHS-P–9.). Order Number DE92627151. Source: OSTI; NTIS (US Sales Only); INIS.

This is the ninth semi-annual report on the Physics section of Physics and Health Sciences. Major areas of discussion include: nuclear physics, accelerator physics, general physics, neutron's solid state physics, theoretical physics and fusion.

20495 (AECL–10332) **Progress report - physical sciences - physics division 1990 July 01 - December 31.** Atomic Energy of Canada Ltd., Chalk River, ON (Canada). Chalk River Nuclear Labs. May 1991. 119p. (PR-PHY–1.). Order Number DE92627152. Source: OSTI; NTIS (US Sales Only); INIS.

A completely new administrative structure of AECL Research was implemented on 1990 July 1. All of the basic physics programs, together with accelerator physics, radiation applications and most of the chemistry programs of AECL, have been placed in a new organizational unit called Physical Sciences. This unit also includes the management of the National Fusion Program. The research programs of Physical Sciences are grouped into three divisions: Chemistry, Physics and TASCC. Progress in each division will henceforth be reported on a twice-yearly basis. This report is the first of the new series to be issued by the Physics Division. Of special note within the period covered by this report was the successful acceleration of over 75 mA of protons to 600 keV in RFQ1 making it the highest current RFQ in the world. Our electron accelerator expertise has been recognized by the award of one of the R and D 100 awards for the IMPELA (10 MeV 50 kW) machine. Considerable activity was associated with bringing the new dual beam neutron spectrometer DUALSPEC to completion. This instrument has been jointly funded by AECL and NSERC through McMaster University and will be a central component of the national neutron scattering facility at NRU in the 1990's. A major effort was made with the writing of a Project Definition Document for installation of a cold neutron source at the most opportune time.

20496 (AECL–10420) **Progress report - physical sciences - physics division 1991 January 01 - June 30.** Atomic Energy of

Canada Ltd., Chalk River, ON (Canada). Chalk River Nuclear Labs. Sep 1991. 117p. (PR-PHY-2.). Order Number DE92627153. Source: OSTI; NTIS (US Sales Only); INIS.

This is the second in the new series of reports for the Physics Division since the creation of the Physical Sciences Unit in 1990. This report has been subdivided into three self-contained sections covering the activities in the branches for Accelerator Physics, Neutron and Solid State Physics and Theoretical Physics. It is noteworthy that the RFQ1 program with the original vanes has come to a successful conclusion having accelerated 79 mA of protons to 600 keV. The new vanes to achieve a high energy of 1.2 MeV have now been installed and will form the basis for the low energy end of high current proton accelerator development. The progress in the neutron scattering program has been hampered by the NRU reactor being down for repairs since January 1991. Nevertheless a very successful opening ceremony was held to mark the completion of the new DUALSPEC spectrometers and several workshops have been held to promote the understanding of neutron scattering.

20497 (ANL/CP--75335) **A strategy for minimizing common mode human error in executing critical functions and tasks.** Beltracchi, L. (Nuclear Regulatory Commission, Washington, DC (United States)); Lindsay, R.W. Argonne National Lab., IL (United States); Nuclear Regulatory Commission, Washington, DC (United States). [1992]. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38. (CONF-920538--18: 8. power plant dynamics, control and testing symposium, Knoxville, TN (United States), 27-29 May 1992). Order Number DE92011839. Source: OSTI; NTIS; INIS; GPO Dep.

Human error in execution of critical functions and tasks can be costly. The Three Mile Island and the Chernobyl Accidents are examples of results from human error in the nuclear industry. There are similar errors that could no doubt be cited from other industries. This paper discusses a strategy to minimize common mode human error in the execution of critical functions and tasks. The strategy consists of the use of human redundancy, and also diversity in human cognitive behavior: skill-, rule-, and knowledge-based behavior. The authors contend that the use of diversity in human cognitive behavior is possible, and it minimizes common mode error.

20498 (ANL/TM--500) **ANL site response for the DOE FY1994 information resources management long-range plan.** Boxberger, L.M. Argonne National Lab., IL (United States). Mar 1992. 180p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38. Order Number DE92012399. Source: OSTI; NTIS; GPO Dep.

Argonne National Laboratory's ANL Site Response for the DOE FY1994 Information Resources Management (IRM) Long-Range Plan (ANL/TM 500) is one of many contributions to the DOE information resources management long-range planning process and, as such, is an integral part of the DOE policy and program planning system. The Laboratory has constructed this response according to instructions in a Call issued in September 1991 by the DOE Office of IRM Policy, Plans and Oversight. As one of a continuing series, this Site Response is an update and extension of the Laboratory's previous submissions. The response contains both narrative and tabular material. It covers an eight-year period consisting of the base year (FY1991), the current year (FY1992), the budget year (FY1993), the plan year (FY1994), and the out years (FY1995-FY1998). This Site Response was compiled by Argonne National Laboratory's Computing and Telecommunications Division (CTD), which has the responsibility to provide leadership in optimizing computing and information services and disseminating computer-related technologies throughout the Laboratory. The Site Response consists of 5 parts: (1) a site overview, describes the ANL mission, overall organization structure, the strategic approach to meet information resource needs, the planning process, major issues and points of contact. (2) a software plan for DOE contractors, Part 2B, "Software Plan FMS plan for DOE organizations, (3) computing resources telecommunications, (4) telecommunications, (5) printing and publishing.

20499 (DOE/AD--0019) **Information Resources Management long-range plan: FY 1993--FY 1997.** USDOE Office of Administration and Human Resource Management, Washington, DC (United States). Office of Information Resources Management Policy, Plans, and Oversight. Feb 1992. 260p. Sponsored by USDOE, Washington, DC (United States). Order Number DE92012408. Source: OSTI; NTIS; GPO Dep.

The Department of Energy (DOE) has consolidated the Information Technology Resources (ITR) plans of its sites into a single document, the Department of Energy Information Resources Management (IRM) Long-Range Plan. This Plan is the product of a long-range planning process used to project both future information technology requirements and the resources necessary to meet those requirements. It encompasses the plans of the various organizational components within the Department and its management and operating contractors over the next 5 fiscal years (FYs), 1993 through 1997. The annual long-range planning cycle for supporting this Plan was initiated by a Call in August 1990 for site plans to be submitted in February 1991 by those Departmental components and contractors with major ITR requirements. The site plans were reviewed by the appropriate DOE Field Office, the Office of IRM Policy, Plans, and Oversight, program offices, and other senior management officials. During this review process, consideration was given to the validity of the programmatic requirements, the reasonableness of funding estimates, identification and resolution of any issues, and other alternatives available. Publication of this Plan is the culmination of the above process.

20500 (DOE/BU--0003) **Forecast of contracting opportunities, fiscal year 1992.** USDOE Office of Small and Disadvantaged Business Utilization, Washington, DC (United States). 1992. 60p. Sponsored by USDOE, Washington, DC (United States). Order Number DE92012651. Source: OSTI; NTIS; GPO Dep.

The Forecast of Contracting Opportunities is published pursuant to Public Law 100-656, "Business Opportunity Development Reform Act of 1988." It is intended to inform shall business concerns, including those owned and controlled by socially and economically disadvantaged individuals, of the anticipated contracting and subcontracting opportunities with the US Department of Energy (DOE) and its Management and Operating contractors for Fiscal Year 1992. The Forecast will provide the small business contractor will advance notice of DOE's procurement plans as they pertain to small and small disadvantaged business concerns. Accordingly, DOE invite small business concerns to explore prime and subcontracting opportunities with headquarters and field offices, as well as with our management and operating contractors.

20501 (DOE/EH--0225P) **Organizational cultural survey of the Los Alamos Site.** USDOE, Washington, DC (United States). Nov 1991. 128p. Sponsored by USDOE, Washington, DC (United States). Order Number DE92012391. Source: OSTI; NTIS; GPO Dep.

An Organizational Survey (OS) was administered at the Los Alamos Site that queried employees on the subjects of organizational culture, various aspects of communications, employee commitment, work group cohesion, coordination of work, environmental, safety, and health concerns, hazardous nature of work, safety and overall job satisfaction. The purpose of the OS is to measure in a quantitative and objective way the notion of "culture;" that is, the values, attitudes, and beliefs of the individuals working within the organization. In addition, through the OS, a broad sample of individuals can be reached that would probably not be interviewed or observed during the course of a typical assessment. The OS also provides a descriptive profile of the organization at one point in time that can then be compared to a profile taken at a different point in time to assess changes in the culture of the organization. While comparisons among groups are made, it is not the purpose of this report to make evaluative statements of which profile may be positive or negative. However, using the data presented in this report in conjunction with other evaluative activities, may provide useful insight into the organization.

20502 (DOE/EH--0244) **Line Program Environmental Management Audit, Western Area Power Administration.** USDOE Assistant Secretary for Environment, Safety, and Health, Washington, DC (United States). Office of Environmental Audit. Mar 1992. 193p. Sponsored by USDOE, Washington, DC (United States). Order Number DE92012682. Source: OSTI; NTIS; GPO Dep.

On June 27, 1989, the Secretary of Energy announced a 10-point initiative to strengthen environmental protection within the US Department of Energy (DOE). Consistent with this initiative, the Secretary emphasized and strengthened independent internal oversight as a management reform in Secretary of Energy Notice (SEN)-11-89, which would monitor the effectiveness of DOE management in complying with operational, environmental, safety, health, and security standards established by law, regulation, and DOE policy. As part of the internal oversight responsibilities within DOE, the Office of Environment, Safety and Health (ES&H) has established a program within the Office of Environmental Audit, EH-24, to conduct environmental audits at DOE's operating facilities. This document contains the results of the Line Program Environmental Management Audit of the Western Area Power Administration (Western). This Line Program Environmental Management Audit was conducted by the DOE's Office of Environmental Audit between December 2 and December 18, 1991. The objective of the Audit is to advise the Secretary as to the adequacy of Western's environmental programs and management organization in ensuring environmental protection and compliance with Federal, state and DOE environmental requirements. The scope of this Line Program Environmental Management Audit was comprehensive and covered all areas of environmental management with the exception of environmental programs pertaining to the implementation of the requirements of the National Environmental Policy Act (NEPA), which is the responsibility of the DOE Headquarters Office of NEPA Oversight.

20503 (DOE/METC/C–92/7010) **Initiation of TQM at a Federal R&D Facility: Early experience.** Wilson, J.S. USDOE Morgantown Energy Technology Center, WV (United States). [1992]. 18p. Sponsored by USDOE, Washington, DC (United States). (CONF-920310–7: American Institute of Chemical Engineers spring meeting, New Orleans, LA (United States), 29 Mar - 2 apr 1992). Order Number DE92010529. Source: OSTI; NTIS; GPO Dep.

The Morgantown Energy Technology Center (METC) is a Federal research and development laboratory that reports to the Assistant Secretary for Fossil Energy of the US Department of Energy (DOE). The laboratory has a wide-ranging mission that involves in-house research activities, procurement, and management of contract research. The Federal staff of 300 employees is about 2/3 professional (engineers, chemists, etc.). A new Director was appointed at METC in April 1990 after 15 years of strong top-down leadership. Among the challenges facing the new Director was a desire to modify the "culture" of the Center to a more participative style coupled with a growing pressure on the efficient use of resource and sustainable worker productivity in the Federal sector. The introduction of a total quality management (TQM) system was viewed as the most appealing proven technique to stimulate the needed changes. A number of activities were undertaken in the fall of 1990 to initiate this program. The Deming Videotapes were used as a training tool to introduce the concepts to the senior managers. Consultants were engaged to train key workers to "facilitate" group work redesign activities, and several pilot projects were completed to illustrate the techniques in "real" work situations. A steering committee that crosscuts the organizations and levels of employees from workers to senior managers was established and has functioned with some success. A new suggestion system has elicited a significant employee input. A recognition system was put in place, and a newsletter has been established to convey the TQM message.

20504 (DOE/MI/10158–1) **Implementation of a prototype training and networking program for minority entrepreneurs and business people in energy-related fields: Final report, July 1990–June 1991.** Grant, C.D. Bronx Community Coll., New York, NY (United States). Business and Professional Development Inst. [1991]. 19p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG02-90MI10158. Order Number DE92011936. Source: OSTI; NTIS; GPO Dep.

In line with these responsibilities of the US Department of Energy, Office of Minority Economic Impact, this project was designed to address problems and implement strategies to assist the underprivileged, minority and entrepreneurs in large metropolitan areas. This project addressed the need for women and minorities to gain access to the many opportunities available in the varied energy-related fields. One way for these "budding entrepreneurs" to become associated with energy-related businesses, learn the ropes, and eventually own a similar business is to be exposed to the guidance of an established business. Toward that end, a series of relevant projects have been identified with the assistance of the Small Business Administration (SBA), the private sector, and the Department of Energy (DOE).

20505 (DOE/RL–91/09) **Hanford 300 Area Development Plan.** Daly, K.S. (Westinghouse Hanford Co., Richland, WA (United States)); Seiler, S.W.; Hail, J.C. USDOE Richland Operations Office, WA (United States). Sep 1991. 162p. Sponsored by USDOE, Washington, DC (United States). Order Number DE92012593. Source: OSTI; NTIS; INIS; GPO Dep.

The purpose of the Hanford 300 Area Development Plan (Development Plan) is to guide the physical development of the 300 Area in accordance with US Department of Energy (DOE) Order 4320.1B (DOE 1991b) by performing the following: (1) Establishing a land use plan, setting land use categories that meet the needs of existing and proposed activities; (2) Coordinating existing, 5-yr, and long-range development plans and guiding growth in accordance with those plans; (3) Establishing development guidelines to encourage cost-effective development and minimize conflicts between adjacent activities; (4) Identifying site development issues that need further analysis; Integrating program plans with development plans to ensure a logical progression of development; and, (6) Integrating DOE plans with local agency plans (i.e., city, country, state, and Tri-Cities Science and Technology Park plans).

20506 (DOE/RL–91-49) **United States Department of Energy Richland Field Office Environmental Protection Implementation Plan, November 9, 1991–November 9, 1992.** Westinghouse Hanford Co., Richland, WA (United States). Feb 1992. 62p. Sponsored by USDOE, Washington, DC (United States). Order Number DE92012163. Source: OSTI; NTIS; INIS; GPO Dep.

The US Department of Energy (DOE) Order 5400.1 (DOE 1988a), General Environmental Protection Program, establishes environmental protection program requirements, authorities, and responsibilities to ensure that DOE operations are in compliance with applicable Federal, State and local environmental protection laws and regulations, executive orders, and internal department policies. Chapter 3 of DOE Order 5400.1 requires that each DOE Field Office prepare a plan for implementing the requirements of this order and update the plan annually. Therefore, this update to the US Department of Energy – Richland Operations Office Environmental Protection Implementation Plan (DOE-RL 1989a), initially prepared November 9, 1989, is being issued.

20507 (DOE/SSDC–76-45/4-Rev.3) **Mort User's Manual: For use with the Management Oversight and Risk Tree analytical logic diagram: Revision 3.** Knox, N.W.; Eicher, R.W. EG and G Idaho, Inc., Idaho Falls, ID (United States). System Safety Development Center. Feb 1992. 66p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC07-76ID01570. (SSDC–4-Rev.3). Order Number DE92013785. Source: OSTI; NTIS; GPO Dep.

This report contains the User's Manual for MORT (Management Oversight and Risk Tree), a logic diagram in the form of a "work sheet" that illustrates a long series of interrelated questions. MORT is a comprehensive analytical procedure that provides a disciplined method for determining the causes and contributing factors of major accidents. Alternatively, it serves as a tool to evaluate the quality of an existing system. While similar in many respects to fault tree analysis, MORT is more generalized and presents over 1500 specific elements of an ideal "universal" management program for optimizing environment, safety and health, and other programs. This User's Manual is intended to be used with the MORT diagram dated February 1992.

20508 (EGD-CERCLA–001/-0590) **Federal Environmental Reporting Requirements Handbook.** USDOE Assistant Secretary for Environment, Safety, and Health, Washington, DC (United States). Environmental Guidance Div. May 1990. 90p. Sponsored by USDOE, Washington, DC (United States). Source: OSTI (Free of Charge).

The Environmental Reporting Requirements Handbook has been developed by DOE Headquarters' Environmental Guidance Division (EH-231) in order to assist DOE Field Organizations in the identification of the various reporting the notification requirements mandated by Federal environmental laws, regulations, and Executive Orders. The Handbook makes a distinction between "routine" and "non-routine" reporting/notification requirements. Routine reporting requirements include the submission of documents that are required either on a regular basis, such as annual or biennial reports, or periodic notifications that result from what would be considered "normal" operations, such as Material Safety Data Sheet (MSDS) updates that are required when new information not contained on previous MSDS submissions is discovered. Non-routine reporting requirements are generally associated with occurrences that represent significant deviations from regulated or planned performance; examples include the unintentional discharge of oil or hazardous substances.

20509 (ER-B-92-04) **Argonne National Laboratory's use of government supply sources.** USDOE Office of Inspector General, Oak Ridge, TN (United States). Eastern Regional Audit Office. 17 Mar 1992. 12p. Sponsored by USDOE, Washington, DC (United States). Source: OSTI (Free of Charge).

The purpose of the audit was to evaluate Argonne's use of Government supply sources. The objective of the audit was to determine whether Argonne had used Government supply sources when these sources were available, economically advantageous, or otherwise in the Government's best interest.

20510 (ER-B-92-05) **Travel at Princeton Plasma Physics Laboratory.** USDOE Office of Inspector General, Oak Ridge, TN (United States). Eastern Regional Audit Office. 17 Mar 1992. 21p. Sponsored by USDOE, Washington, DC (United States). Source: OSTI (Free of Charge).

Our audit disclosed that Princeton Plasma Physics Laboratory (PPPL) did not always comply with the travel requirements of its contract. Specifically: (1) Travelers were routinely reimbursed for lodging costs without receipts; (2) other travel costs were not always adequately documented; (3) supervisors did not always review and approve travel before or after trips; and (4) travel advances exceeded contract limitations. These conditions resulted because laboratory management decided that lodging receipts were not required by the contract, so they did not enforce contract travel requirements. Consequently, $301,073 of travel costs were not in compliance with the contract and are therefore unallowable. Accordingly, we recommend that the Acting Manager, Department of Energy Chicago Field Office, direct the laboratory to comply with the contract's travel requirements and recover these unallowable travel costs. Management concurred with our recommendations to direct PPPL to comply with the travel requirements of its contract but did not occur that PPPL incurred costs that were not in compliance with its contract and should be disallowed and refunded. Management did not concur with the conclusion that PPPL's management of travel expenses represents a material internal control weakness.

20511 (ER-B-92-06) **Selected aspects of the Governor's Office of Energy Programs management of Petroleum Violation Escrow funds State of South Carolina.** USDOE Office of Inspector General, Oak Ridge, TN (United States). Eastern Regional Audit Office. 20 Mar 1992. 13p. Sponsored by USDOE, Washington, DC (United States). Source: OSTI (Free of Charge).

The purpose of the audit was to determine the propriety of certain matters concerning the Governor's Office of Energy Programs management of the Warner Amendment and Exxon Petroleum Violation Escrow (PVE) funds. The audit objective was to answer the following issues concerning use of Warner Amendment and Exxon funds.

20512 (INIS-GB-439) **The Department of Energy's nuclear R and D programmes [United Kingdom]: Consultation document.** Department of Energy, London (United Kingdom). Aug 1991 122p. Order Number DE92628415. Source: OSTI; NTIS (US Sales Only); INIS.

This Consultation Document reviews how the United Kingdom Department of Energy's nuclear R and D programmes support the Government's nuclear policy and reaches preliminary conclusions about their future direction. It describes the changes the Department has adopted, and is proposing, to ensure that it is better informed about the nuclear R and D it commissions and that the work is carried out cost-effectively. The areas of research reviewed are: safety; radiological protection; safeguards; reactor technology; fusion; decommissioning and waste management. (author).

20513 (INIS-mf-13180) **Annual report 1989.** Bhabha Atomic Research Centre, Bombay (India). Dec 1990 147p. Order Number DE92627154. Source: OSTI; NTIS (US Sales Only); INIS.

The main thrust of various research and development activities of the Bhabha Atomic Research Centre (BARC) is directed towards: (1) supporting nuclear power programme in all its aspects which include design of nuclear reactors, development of nuclear fuel and materials, and management of nuclear waste, (ii) producing radioisotopes and promoting their applications in agriculture, medicine and industries, and (iii) providing research and development and service backup to ensure health and radiation protection in nuclear facilities. BARC also carries out R and D work in frontier areas of science like plasma and fusion physics, accelerators and lasers, high temperature superconductivity, condensed mater physics, high pressure physics, high resolution spectroscopy, chemical reaction dynamics, laser induced chemistry, electronics, robotics, radiation biology, and genetic engineering. These R and D activities during 1989 are described in brief in the chapters entitled: Physical Sciences, Chemical Sciences, Materials and Materials Sciences, Radioisotopes, Reactors, Fuel Cycle, Radiological Safety and Protection, Electronics and Instrumentation, Engineering Services, and Life Sciences. The last chapter entitled General describes the supporting activities like technical information services, industrial safety etc. At the end of each chapter, a list of publications during the year by scientists of the Centre in the corresponding field is given. (M.G.B.).

20514 (INIS-mf-13181) **Annual report 1990-91.** Department of Atomic Energy, Bombay (India). 1991 118p. Order Number DE92627155. Source: OSTI; NTIS (US Sales Only); INIS.

The annual report of the Department of Atomic Energy (DAE), India, for the fiscal year 1990-91 describes: (1) the research and development work carried out by DAE's various research establishments and by fully funded research institutes, (2) performance of nuclear power stations, nuclear fuel complex, fuel reprocessing plants and heavy water plants, (3) exploration work for atomic minerals, (5) regulatory and safety functions, (6) performance of public sector undertakings, namely Indian Rare Earths Ltd., Electronics Corporation of India Ltd., and (6) other activities like international relations, emergency planning, financial assistance to research projects, etc. During the year, 6182 MUs electricity was generated, Unit-1 of Narora Atomic Power Station commenced commercial operation, Hazira Heavy Water Plant was commissioned, Sewage Hygienisation Research Irradiator at Baroda and Heavy Rare Earths Oxide Plant at Udyogmandal were also commissioned, promising geologic deposits of uranium were found at Domiasat (Meghalaya), and PURNIMA-III attained criticality. (M.G.B.).

20515 (KCP-613-4849) **Team based Daily Problem Solving: When groups problem solve, everyone listens.** Allied-Signal Aerospace Co., Kansas City, MO (United States). Kansas City Div. Mar 1992. 13p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-76DP00613. (CONF-920494-3: Association for Quality and Participation (AQP) annual spring conference, Seattle, WA (United States), 6-9 Apr 1992). Order Number DE92011342. Source: OSTI; NTIS; GPO Dep.

Team based Daily Problem Solving (DPS) is designed to identify root-cause and solutions to problems at the core level in a fast and expedient manner using the subject experts. DPS emphasizes team work over individual effort. This system can be used in any work environment.

20516 (KCP-613-4854) **Gateway to total participation: The reality of staying competitive in the 1990s.** Cooper, B.; Reynolds, D.; Shepherd, D. Allied-Signal Aerospace Co., Kansas

City, MO (United States). Kansas City Div. Mar 1992. 15p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-76DP00613. (CONF-920494–4: Association for Quality and Participation (AQP) annual spring conference, Seattle, WA (United States), 6-9 Apr 1992). Order Number DE92011341. Source: OSTI; NTIS; GPO Dep.

People Involvement activities are used to bridge all aspects of our manufacturing business. This involvement is evident in the daily operation meetings conducted for information sharing, problem solving, concurrent engineering, and planning the work day as a business unit. Our business structure promotes total participation and fosters individual development.

20517 (LA–12198-MS) **The leadership of philosopher kings.** Canavan, G.H. Los Alamos National Lab., NM (United States). May 1992. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. Order Number DE92012564. Source: OSTI; NTIS; GPO Dep.

A "rule of seven" implies a scientific organization in which each leader is expected to contribute technically, giving each member a responsibility for the creative work needed for effective leadership. It would decentralize leadership, pushing decisions down to the level where they should be made. Such a structure need not be imposed from above.

20518 (LUTFD2-TFRT–4019-1-71-1991) **Activity Report 1990-1991.** Dagnegaard, E.; Aastroem, K.J. (eds.). Lund Univ. (Sweden). Dept. of Automatic Control. Oct 1991. 71p. Order Number DE92628416. Source: OSTI; NTIS (US Sales Only); INIS.

This report covers the activities at the Department of Automatic Control at Lund University during the period 1 July 1990 - 30 June 1991, which is the academic year 1990/91. During this period Bo Eliasson and Lars Rundqwist completed their PhD theses. This brings the total number of PhDs graduating from our department to 33. Twenty-one students completed their MSc degree at the department. One book, seventeen journal papers and 48 conference papers were published by staff members. Research has continued in established areas such as adaptive control, expert control, computer aided control engineering, robotics, and information technology.

20519 (NUREG–1414) **Differing professional views or opinions: 1990 Special Review Panel.** Bird, P.E.; Heltemes, C.J. Jr.; Hearn, P.C.; Montgomery, J.M. Nuclear Regulatory Commission, Washington, DC (United States). Apr 1992. 62p. Sponsored by Nuclear Regulatory Commission, Washington, DC (United States). Source: OSTI; NTIS; GPO.

In December 1989, the Executive Director Operations of the US Regulatory Commission (NRC) appointed a Special Review Panel to evaluate the effectiveness of NRC Manual Chapter 4125, Differing Professional Views or Opinions, and NRC Manual Chapter 4126, Open Door Policy. In accordance with Section E of NRC Appendix 4125, the Panel was responsible for assessing "... the informal and formal processes for dealing with differing professional views or opinions, including the effectiveness of the processes, how well they are understood by employees, and the organizational climate for having these views and opinions aired and properly decided." This report presents the Special Review Panel's evaluation of the NRC's current process for dealing with Differing Professional Views or Opinions. Provided in this report are the results of an employee opinion survey on the process; highlights and suggestions from interviews with individuals who had submitted a Differing Professional view or Opinion, as well as with agency managers directly involved with the Differing Professional Views or Opinions process; and proposed revisions to Manual Chapters 4125 and 4126.

20520 (OUP–91-31) **List of publications 1990: Scientific and specialist works from Department of Physics.** Oslo Univ. (Norway). Fysisk Inst. Dec 1991. 50p. (In Norwegian). Order Number DE92628417. Source: OSTI; NTIS (US Sales Only); INIS.

This annual bibliography of publications refers to research reports, contribution to newspapers and scientific journals, guest lectures, and popular science lectures.

20521 (PNL-SA–20246) **Compression planning for continuous improvement in quality programs.** Willis, Y.A. (Willis Consulting, PA (United States)); Hood, F.C. Pacific Northwest Lab., Richland, WA (United States). Apr 1992. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. (CONF-920430–83: International high level radioactive waste management (IHLRWM) conference: promoting understanding through education and communication, Las Vegas, NV (United States), 12-16 Apr 1992). Order Number DE92012331. Source: OSTI; NTIS; GPO Dep.

This paper describes an innovative approach to planning and prioritizing. The approach, "Compression Planning," conserves time for the planners while building commitment to continuous improvement and implementation of the plan. Beginning May 1990, "Compression Planning" was applied to the first organization-wide effort at training integration for regulatory compliance at Battelle Pacific Northwest laboratory (PNL), a multi-program national laboratory. Various applications of this methodology have been used at PNL for programs since then.

20522 (RISO-M–2944) **Nuclear Safety Research Department. Annual progress report 1990.** Heikel Vinther, F. (ed.). Risoe National Lab., Roskilde (Denmark). Nuclear Safety Research Dept. Jul 1991. 36p. Order Number DE92628418. Source: OSTI; NTIS (US Sales Only); INIS.

The report describes the work of the Nuclear Safety Research Department during 1990. The activities cover health physics, reactor physics, operation of the educational reactor DR 1, and waste management. Lists of staff and publications are included together with a summary of participation in international working groups etc. (au) 3 ills., 30 refs.

20523 (SAND–92-0323) **Purchasing and Materials Management Organization, Sandia National Laboratories: Annual report, fiscal year 1991.** Zaeh, R.A. Sandia National Labs., Albuquerque, NM (United States). Apr 1992. 149p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-76DP00789. Order Number DE92013676. Source: OSTI; NTIS; GPO Dep.

This report contains the purchasing and materials management operating highlights for Fiscal Year 1991. Included in the report are compiled data on: personnel; type of procurement; small business procurements; disadvantaged business procurements; woman-owned business procurements; New Mexico commercial business procurements; Bay Area commercial business procurements; commitments by states and foreign countries to commercial suppliers; and, transportation activities. Other statistical data tables enumerate the following: the twenty-five commercial contractors receiving the largest dollar commitments; commercial contractors receiving commitments of $1000 or over; integrated contractor and federal agency commitments of $1000 or over from Sandia National Laboratories-Albuquerque and Livermore; and, transportation commitments of $1000 or over from Sandia National Laboratories-Albuquerque and Livermore.

20524 (SAND–92-0407C) **Strategies for change within Sandia National Laboratories.** Burcham, W.R. Sandia National Labs., Albuquerque, NM (United States). [1992]. 21p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-76DP00789. (CONF-9204116–1: 8. annual Performance Management Association conference, San Francisco, CA (United States), 1-3 Apr 1992). Order Number DE92012375. Source: OSTI; NTIS; GPO Dep.

This paper identifies some of the sources of resistance to change that face Sandia National Laboratories' management, and examines the mechanisms that are being used to minimize the effects of that resistance. The rapid and radical nature of many of the changes now being demanded of Sandia make them all the more likely to meet stiff resistance from within the organization. Sandia's management has attempted to anticipate some of the sources of resistance to the changes planned for its operating procedures and has taken action to minimize their effects. Within this paper, particular attention is given to those individuals who will not only be most effected by, by may also be required to implement the changes. The change process at Sandia is currently ongoing. It is not complete. No claim is made that all of the changes that will be necessary at Sandia National Laboratories have been recognized, nor that all sources of resistance have been anticipated.

20525 (SAND–92-0477C) **Files improvement the NARA way.** Pasterczyk, C. Sandia National Labs., Albuquerque, NM (United States). 19 Mar 1992. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-76DP00789. (CONF-9203113–1: 1992 spring seminar Rio Grande chapter Association of Records Managers and Administrators, Albuquerque, NM (United States), 19 Mar 1992). Order Number DE92011139. Source: OSTI; NTIS; GPO Dep.

The purpose of this talk is to set the scene with a definition of records management, records and federal records. It is also to introduce some techniques to ensure that office files are properly organized and maintained, rapidly retrievable, complete, and ready for appropriate disposition the NARA (National Archives and Records Administration) way.

20526 (SAND–92-0487) **An annotated bibliography of selected books and articles on benchmarking.** Allan, F.C. (comp.). Sandia National Labs., Albuquerque, NM (United States). Jan 1992. 10p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-76DP00789. Order Number DE92013650. Source: OSTI; NTIS; GPO Dep.

This bibliography contains 34 references concerning utilizing benchmarking in the management of businesses. Books and articles are both cited. Methods for gathering and utilizing information are emphasized. (GHH)

20527 (SAND–92-0810C) **The technology-based regional economic development program at Sandia National Laboratories.** Allen, M.S. Sandia National Labs., Albuquerque, NM (United States). [1992]. 13p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-76DP00789. (CONF-9206151–1: Technology Transfer Society (TTS) conference, Athens, GA (United States), 24-26 Jun 1992). Order Number DE92011664. Source: OSTI; NTIS; GPO Dep.

In November of 1989, technology transfer became a mission for Sandia National Laboratories, (SNL), with the passage of the National Competitiveness Technology Transfer Act. In order to address the specialized technology transfer needs of small businesses, SNL created and implemented the Technology-Based Regional Economic Development (TRED) program. The TRED model has two major components – technology assistance (or teaming), and " widget transfer." In the technology assistance component, SNL's technology resources (expertise, services, and equipment) are made available to companies developing commercial products. In the "widget transfer" component, SNL's intellectual property (patents, copyrights) is placed with private sector firms through various partnership intermediaries.

20528 (AECL–10507) **Ewe: a computer model for ultrasonic inspection.** Douglas, S.R.; Chaplin, K.R. Atomic Energy of Canada Ltd., Chalk River, ON (Canada). Chalk River Nuclear Labs.; Ontario Hydro, Toronto, ON (Canada). Nov 1991. 55p. (COG–91-261.). Order Number DE92627145. Source: OSTI; NTIS (US Sales Only); INIS.

The computer program EWE simulates the propagation of elastic waves in solids and liquids. It has been applied to ultrasonic testing to study the echoes generated by cracks and other types of defects. A discussion of the elastic wave equations is given, including the first-order formulation, shear and compression waves, surface waves and boundaries, numerical method of solution, models for cracks and slot defects, input wave generation, returning echo construction, and general computer issues.

20529 (ANL–91/34, pp. 1) **Interfacing performance measurement capabilities into a parallel language compiler.** Kesselman, C. (California Inst. of Tech., Pasadena (United States)). Argonne National Lab., IL (United States). Nov 1991. (CONF-9110321–: Workshop on compilation of (symbolic) languages for parallel computers, San Diego, CA (United States), 31 Oct - 1 nov 1991). In *Proceedings of the workshop on Compilation of (Symbolic) Languages for Parallel Computers.* 176p. Order Number DE92006819. Source: OSTI; NTIS.

When developing a parallel program, one is ultimately interested in how effectively that program uses the parallel computer on which it runs. In this sense, identifying and eliminating performance bottlenecks is central to parallel computing. The number of times a procedure executes on a processor, or how much time is spent waiting for interprocessor communication are typical of the types of information needed to identify and eliminate performance bottlenecks. A means for measuring quantities such as these is essential to any practical parallel programming system. Recognizing this, facilities for performance measurement have been integrated into the programming environment for Program Composition Notation (PCN), a parallel programming language based on program composition, single assignment variables, and recursively defined data structures. Facilities for performance measurement were designed into the PCN implementation from the beginning. The approach the author has taken combines novel measurement techniques with statistical performance models to provide performance measurements with extremely low overhead. In this talk, he will discuss issues in the design of performance measurement systems for parallel programs and he will show how these issues have been addressed in PCN. An overview of the implementation of performance measurement in PCN will be given, paying particular attention to the influence measurement had on the design of the PCN implementation and the PCN compiler.

20530 (ANL–91/34, pp. 2-17) **Message-oriented parallel implementation of moded flat GHC.** Ueda, Kazunori (Inst. for New Generation Computer Technology, Tokyo (Japan)); Morita, Masao. Argonne National Lab., IL (United States). Nov 1991. (CONF-9110321–: Workshop on compilation of (symbolic) languages for parallel computers, San Diego, CA (United States), 31 Oct - 1 nov 1991). In *Proceedings of the workshop on Compilation of (Symbolic) Languages for Parallel Computers.* 176p. Order Number DE92006819. Source: OSTI; NTIS.

The authors proposed in [UM90] a new, message-oriented implementation technique for Moded Flat GHC that compiles unification for data transfer into message passing. The technique was based on constraint-based program analysis that was amenable to separate compilation, and significantly improved the performance of programs that used goals and streams to implement reconfigurable data structures. In this paper they discuss how the technique can be parallelized. They focus on the shared-goal method for shared-memory multiprocessors, though a different scheme could be used for distributed-memory multiprocessors. Unlike other parallel implementations of concurrent logic languages which they call process-oriented, the unit of parallel execution is not an individual goal but a chain of message sends caused successively by an initial message send. Parallelism comes from the existence of different chains of message sends that can be executed independently or in a pipelined manner. Mutual exclusion based on busy waiting and on message buffering controls access to individual, shared goals. Typical goals allow last-send optimization, the message-oriented counterpart of last-call optimization. They are building an experimental implementation on Sequent Symmetry. In spite of the simple scheduling currently adopted, preliminary evaluation shows good parallel speedup and good absolute performance for concurrent operations on binary process trees.

20531 (ANL–91/34, pp. 18-29) **An overview of the Fortran D programming system.** Hiranandani, Seema, (Rice Univ., Houston, TX (United States)); Kennedy, K.; Koelbel, C.; Kremer, U.; Chauwen Tseng. Argonne National Lab., IL (United States). Nov 1991. (CONF-9110321–: Workshop on compilation of (symbolic) languages for parallel computers, San Diego, CA (United States), 31 Oct - 1 nov 1991). In *Proceedings of the workshop on Compilation of (Symbolic) Languages for Parallel Computers.* 176p. Order Number DE92006819. Source: OSTI; NTIS.

The success of large-scale parallel architectures is limited by the difficulty of developing machine-independent parallel programs. The authors have developed Fortran D, a version of Fortran extended with data decomposition specifications, to provide a portable data-parallel programming model. This paper presents the design of two key components of the Fortran D programming system: a prototype compiler and an environment to assist automatic data decomposition. The Fortran D compiler addresses program partitioning, communication generation and optimization, data decomposition analysis, run-time support for unstructured computations, and storage management. The Fortran D programming environment provides a static performance estimator and an automatic data partitioner. They believe that the Fortran D programming system will significantly ease the task of writing machine-independent data-parallel programs.

20532 (ANL–91/34, pp. 30-37) **OSCAR FORTRAN compiler.** Kasahara, H. (Waseda Univ., Tokyo (Japan)); Honda, H.; Aida, K.; Okamoto, M.; Narita, S. Argonne National Lab., IL (United States). Nov 1991. (CONF-9110321–: Workshop on compilation of (symbolic) languages for parallel computers, San Diego, CA (United States), 31 Oct - 1 nov 1991). In *Proceedings of the workshop on Compilation of (Symbolic) Languages for Parallel Computers.* 176p. Order Number DE92006819. Source: OSTI; NTIS.

Oscar Fortran compiler has been developed for a shared memory multiprocessor system named OSCAR (Optimally Scheduled Advanced Multiprocessor). The compiler hierarchically exploits coarse grain parallelism among loops, subroutines and basic blocks, medium grain parallelism among loop-iterations and near fine grain parallelism among statements. The coarse grain parallelism is automatically detected in the form of earliest executable conditions of the coarse grain tasks, or the macro-tasks. The earliest executable conditions are obtained by a united control dependence and data dependence analysis. The macrotasks are dynamically assigned to processor clusters by a scheduling routine generated by the compiler. A macrotask composed of a Do-all or Do-across loop, which is assigned onto a processor cluster, is hierarchically processed in parallel in the medium grain by processors inside the processor cluster. A macrotask composed of a sequential loop or a basic block on a processor cluster is also processed in parallel in the near fine grain by using static scheduling. A prototype compiler has been implemented on OSCAR having sixteen RISC processors and its usefulness has been confirmed on the system.

20533 (ANL–91/34, pp. 38-39) **Coordination language design and implementation issues.** Lucco, S. (California Univ., Berkeley (United States)); Sharp, O. Argonne National Lab., IL (United States). Nov 1991. (CONF-9110321–: Workshop on compilation of (symbolic) languages for parallel computers, San Diego, CA (United States), 31 Oct - 1 nov 1991). In *Proceedings of the workshop on Compilation of (Symbolic) Languages for Parallel Computers.* 176p. Order Number DE92006819. Source: OSTI; NTIS.

One can think of a parallel program as a group of sequential sub-computations which cooperate to solve a problem. To exploit existing code and optimization tools, programmers usually choose to write these sub-computations in traditional imperative languages such as C, Fortran, or Lisp. A coordination language expresses data exchange and synchronization among such sub-computations. The authors are investigating the effectiveness of coordination languages as tools for concise expression and efficient implementation of parallel programs. In this presentation, they will outline some design and implementation issues critical to the expressiveness and performance of coordination languages. Using these criteria, they will compare existing coordination languages including Strand, PCN, Linda, Jade, Delirium, and extended Fortran dialects.

20534 (ANL–91/34, pp. 40-57) **Designing imperative programming languages for analyzability: Parallelism and pointer data structures.** Hendren, L. (McGill Univ., Longueuil, Quebec (Canada)); Gao, G.R. Argonne National Lab., IL (United States). Nov 1991. (CONF-9110321–: Workshop on compilation of (symbolic) languages for parallel computers, San Diego, CA (United States), 31 Oct - 1 nov 1991). In *Proceedings of the workshop on Compilation of (Symbolic) Languages for Parallel Computers.* 176p. Order Number DE92006819. Source: OSTI; NTIS.

The rapid advance of computer architectures has provided important new challenges for programming language designers and compiler writers alike. One of these challenges is to provide programming languages that are analyzable so that compilers can effectively exploit the level of parallelism that is necessary for effective use of such architectures. Historically, the analysis of scientific programs using arrays has made crucial use of information such as array dimension and size, the mathematical structure of arrays, and the regularity of the looping constructs used for programming with arrays. In this paper the authors argue that, just as arrays are important in scientific programs, pointer data structures often play a central role in non-scientific and symbolic programs, and therefore the analyzability of pointer data structures is critical. To illustrate both the importance of analyzability for programs with pointer data structures and the solution methodology proposed in this paper, they propose a programming language mechanism which significantly enhances the analyzability of pointer-based data structures frequently used in non-scientific programs. In this paper they give an overview of their approach to designing analyzable imperative languages. They give a concrete example of applying the techniques to exploit fine-grain parallelism in while loops that traverse linked list structures. The effectiveness of their approach is demonstrated by applying it to a collection of loops found in typical non-scientific C programs. In addition, they outline how their approach can be used to exploit coarse-grain parallelism, and they give some challenges open in this area.

20535 (ANL–91/34, pp. 58-59) **Compile-time parallelization of Prolog.** Millroth, H. (Uppsala Univ., Nykoeping (Sweden)). Argonne National Lab., IL (United States). Nov 1991. (CONF-9110321–: Workshop on compilation of (symbolic) languages for parallel computers, San Diego, CA (United States), 31 Oct - 1 nov 1991). In *Proceedings of the workshop on Compilation of (Symbolic) Languages for Parallel Computers.* 176p. Order Number DE92006819. Source: OSTI; NTIS.

Previous attempts at developing parallel Prolog systems have focused on exploiting AND-parallelism, or OR-parallelism, or both. In this work the author parallelizes Prolog by exploiting parallelism in its fundamental control structure: recursion. They have developed a compilation technique in which recursion over recursive data structures is compiled to bounded iteration (for-loops) over vectors (the vectors are somewhat analogous to binding environments). The technique is based on an analysis of the unification patterns of recursive programs in Reform computations. (Reform is a new inference systems for logic programming which handles recursion differently from SLD-resolution.) This compilation technique gives a more efficient parallelization of recursive programs than is possible with a system based on SLD-resolution. In a parallel system based on SLD-resolution it takes O(N) time to spawn all N recursive calls to the program. In this model, the time complexity for getting all recursion levels into work is bounded only by the time it takes to distribute the input data of the program. This may take O(log N) time (on, for example, a machine with tree topology) or O(1) time (in case the input data is already distributed).

20536 (ANL–91/34, pp. 60-72) **Compiling Crystal for massively parallel machines.** Chen, M. (Yale Univ., New Haven, CT (United States)); Youngil Choo. Argonne National Lab., IL (United States). Nov 1991. (CONF-9110321–: Workshop on compilation of (symbolic) languages for parallel computers, San Diego, CA (United States), 31 Oct - 1 nov 1991). In *Proceedings of the workshop on Compilation of (Symbolic) Languages for Parallel Computers.* 176p. Order Number DE92006819. Source: OSTI; NTIS.

The Crystal project has focused on making the task of programming massively parallel machines practical while not sacrificing the efficiency of the target code. The compilation strategy is to start from a high-level problem specification, apply a sequence of optimizations tuned for particular parallel machines, and finally generate code with explicit communication or synchronization. The computation and data are distributed based on the analysis of communication patterns in the program and the cost of communication primitives of the target machine. Taking advantage of the fact that many algorithms exhibit natural parallelism when formulated mathematically, the approach to parallel programming is to use a purely functional language that resembles mathematical notation. The language has higher-order operators and data structures, thereby making the extraction of parallelism far simpler and allowing us to focus on the global communication issues for massively parallel machines. The simpler semantics of the language allows one to formulate a rigorous theory of program optimization that is indispensable both in the automatic analysis of communication patterns and the explicit specification of user-defined mapping strategies.

20537 (ANL–91/34, pp. 73-85) **A new method for compile-time granularity analysis.** Zhong, X. (Univ. of Oregon, Eugene (United States)); Tick, E.; Duvvuru, S.; Hansen, L.; Sastry, A.V.S.; Sundararajan, R. Argonne National Lab., IL (United States). Nov 1991. (CONF-9110321–: Workshop on compilation of (symbolic) languages for parallel computers, San Diego, CA (United States), 31 Oct - 1 nov 1991). In *Proceedings of the workshop on Compilation of (Symbolic) Languages for Parallel Computers.* 176p. Order Number DE92006819. Source: OSTI; NTIS.

The authors present a new granularity analysis scheme for concurrent logic programs. The main idea is that, instead of trying to estimate costs of goals precisely, they provide a compile-time analysis method which can efficiently and precisely estimate relative costs of active goals given the cost of a goal at runtime. This is achieved by estimating the cost relationship between an active goal and its subgoals at compile time, based on the call graph of the program. Iteration parameters are introduced to handle recursive procedures. Compared with methods in the literature, this scheme has several advantages: it is applicable to any program, it gives a more precise cost estimation than static methods, and it has lighter runtime overheads than absolute estimation methods.

20538 (ANL–91/34, pp. 86-92) **GST: Grain-size transformations for efficient execution of symbolic programs.** Chien, A.A. (Univ. of Illinois, Urbana (United States)); Wuchen Feng. Argonne National Lab., IL (United States). Nov 1991. (CONF-9110321–: Workshop on compilation of (symbolic) languages for parallel computers, San Diego, CA (United States), 31 Oct - 1 nov 1991). In *Proceedings of the workshop on Compilation of (Symbolic) Languages for Parallel Computers.* 176p. Order Number DE92006819. Source: OSTI; NTIS.

Controlling grain size is a key issue which spans programming approaches and machine architectures in parallel systems. The ability to effectively adjust program grain size, is a critical component of achieving efficient, portable parallel programming. A number of programming models have been used to express application programs with large quantities of fine-grained concurrency. Unfortunately, despite rapid improvements in processor architecture, the authors currently cannot exploit such fine-grained concurrency efficiently. Even if such architectures were available, portability issues motivate the development of grain-size control techniques. They are pursuing the construction of a grain-size transformer system which merges grains, increasing the execution grain size for more efficient execution.

20539 (ANL–91/34, pp. 93-107) **Using domain-specific, abstract parallelism.** Baxter, I. (Schlumberger Lab. for Computer Science, Austin, TX (United States)); Kant, E. Argonne National Lab., IL (United States). Nov 1991. (CONF-9110321–: Workshop on compilation of (symbolic) languages for parallel computers, San Diego, CA (United States), 31 Oct - 1 nov 1991). In *Proceedings of the workshop on Compilation of (Symbolic) Languages for Parallel Computers.* 176p. Order Number DE92006819. Source: OSTI; NTIS.

Discovery of potential parallelism in low level code is difficult, especially in the absence of problem domain knowledge. An alternative is to explicitly represent maximal potential parallelism in abstract program components. A transformation system refines a program composed of such components into a concrete program. The authors discuss an experimental system in which they are installing such facilities. An example refinement sequence is provided.

20540 (ANL–91/34, pp. 108-110) **Applying abstract interpretation to identify vectorizable numerical code in logic programs.** Bansal, A.K. (Kent State Univ., OH (United States)); Poduval, D.S. Argonne National Lab., IL (United States). Nov 1991. (CONF-9110321–: Workshop on compilation of (symbolic) languages for parallel computers, San Diego, CA (United States), 31 Oct - 1 nov 1991). In *Proceedings of the workshop on Compilation of (Symbolic) Languages for Parallel Computers.* 176p. Order Number DE92006819. Source: OSTI; NTIS.

In this paper, the authors describe an application of abstract interpretation to identify the vectorizable numerical code. This vector analysis scheme derives definite iteration, the information about bound and indices, identification of vectors simulated by lists or functors, and the derivation of vector-size. The vector analysis scheme is based upon extending abstract domain from type domain to the abstract domain as vector domain. Vector domain is a superset of type domain and includes vector related information along with typed related information. However, they differentiate between the two different modules, namely abstract interpretation in type domain and abstract interpretation in vector domain since the output of type domain is also used for producer-consumer analysis, identifying different types of parallelism, and identifying deterministic code - codes which have no alternative solution. The vector analysis scheme has five components, namely, generalization, vector unification, vector summarization, concretization, and iteration analysis. The first four components are used to propagate and collect the information in the vector domain and the last component uses solving a system of linear equation to derive the vector-size information, and the identification and disambiguation of index and bounds for iterative constructs simulated using tail recursive programs. They describe various schemes and explain the algorithms. They also discuss the current issues to integrate AND, OR, and stream parallelism with vectorization.

20541 (ANL–91/34, pp. 111-113) **Data locality.** Lam, M.S. (Stanford Univ., CA (United States)). Argonne National Lab., IL (United States). Nov 1991. (CONF-9110321–: Workshop on compilation of (symbolic) languages for parallel computers, San Diego, CA (United States), 31 Oct - 1 nov 1991). In *Proceedings of the workshop on Compilation of (Symbolic) Languages for Parallel Computers.* 176p. Order Number DE92006819. Source: OSTI; NTIS.

Previous research on parallelizing compilers for sequential imperative programming languages concentrated on the extraction of parallelism. Recent results in the area indicate that the extraction of parallelism is only the first step. The discovery of a large amount of parallelism does not necessarily translate to a gain in performance because the overhead in synchronization and communication can render parallelization ineffective. Improving data locality, thus reducing the communication overhead, will become even more important as processor speeds continue to increase much faster than communication and memory access rates. The study of parallelism must therefore be coupled with the study of locality. While standard scalar optimizations aim to reduce the total instruction count in a program, locality optimizations rearrange the computation to reduce the cost of data accesses by taking better advantage of the memory hierarchy. The author takes a three-tiered approach to the problem: first, she tries to group operations that use the same block of data as a unit of computation allocated to a processor. In this way, the cost of fetching the data is amortized across all the operations using the data. If this technique does not reduce the communication adequately, she tries to allocate the computation and data to processors in a way that minimizes interprocessor communication. Lastly, if communication is unavoidable, she tries to hide the latency of the communication by overlapping the data fetches with computation on other data. She has been focusing on two different computation domains which require different techniques in gathering the information necessary for locality optimizations. They are dense matrix computations where a fully automatic compiler approach is feasible, and coarse-grain tasks where linguistic support is necessary.

20542 (ANL–91/34, pp. 114-128) **Compiling FP for data-parallel systems.** Walinsky, C. (Dartmouth Coll., Hanover, NH (United States)); Banerjee, D. Argonne National Lab., IL (United States). Nov 1991. (CONF-9110321–: Workshop on compilation of (symbolic) languages for parallel computers, San Diego, CA (United States), 31 Oct - 1 nov 1991). In *Proceedings of the workshop on Compilation of (Symbolic) Languages for Parallel Computers.* 176p. Order Number DE92006819. Source: OSTI; NTIS.

In data-parallel programming, operations are performed simultaneously on all elements of large data structures. Backus's FP functional language promotes this view. FP provides a large set of data rearrangement primitives, and a useful set of functional combining forms that are applied to entire data structures. The authors present an overview of an FP compiler that generates programs capable of exploiting data-parallelism. The FP compiler determines the effects of data rearrangement functions at compile-time, thereby avoiding creation of large intermediate data structures, and reducing communication overhead. FP and its compiler are formally specified, reducing ambiguity concerning constructs of the language and results of the compiler.

20543 (ANL–91/34, pp. 129-148) **Improving compilation of implicit parallel programs by using runtime information.** Sargeant, J. (Univ. of Manchester (United Kingdom)). Argonne National Lab., IL (United States). Nov 1991. (CONF-9110321–: Workshop on compilation of (symbolic) languages for parallel computers, San Diego, CA (United States), 31 Oct - 1 nov 1991). In *Proceedings of the workshop on Compilation of (Symbolic) Languages for Parallel Computers.* 176p. Order Number DE92006819. Source: OSTI; NTIS.

In the quest for the Holy Grail of efficient implicit parallelism, the authors have opted for a conventional architecture with physically distributed but virtually shared memory (The EDS machine), and a Large Grain Graph Rewriting computational model. On programming languages, they hedge their bets, but the work described here uses a (strict) functional language. This set of choices eliminates many of the problems and brings those which remain into sharp focus. All they need to do is achieve efficient dynamic load balancing, high granularity, and good data structure locality. They are investigating an approach whereby the program is first compiled with monitoring code inserted, and run (using relatively small data sets) to produce statistics which are fed back into the compiler which then produces optimized parallel code. For strict functional programs, the production of statistics is straightforward, although automatically using them effectively is not. The paper discusses a number of issues, including the effect of higher-order functions and other more advanced language features, and various practical problems. This work is embryonic, but the method seems to have significant advantages over static analysis or hand annotation, and also provides extra performance information for the programmer.

20544 (ANL–91/34, pp. 149-160) **Generalized iteration space and the parallelization of symbolic programs.** Harrison, L. Argonne National Lab., IL (United States). Nov 1991. (CONF-9110321–: Workshop on compilation of (symbolic) languages for parallel computers, San Diego, CA (United States), 31 Oct - 1 nov 1991). In *Proceedings of the workshop on Compilation of (Symbolic) Languages for Parallel Computers.* 176p. Order Number DE92006819. Source: OSTI; NTIS.

A large body of literature has developed concerning the automatic parallelization of numerical programs, and a quite separate literature has developed concerning the parallelization of symbolic programs. Because many symbolic programs make heavy use of array data and iterative constructs, in addition to more symbolic language features like pointers and recursion, it is desirable to fuse these bodies of work so that results developed for numerical programs can be applied to symbolic ones, and generalized so that they apply to the variety of language constructs encountered in symbolic computations. In this paper is described a framework, called generalized iteration space, that allows one to unify dependence analysis of array computations with dependence analysis of pointer computations. It is shown that subscripted array accesses as well as pointer dereferences can be seen as linear functions of generalized iteration space. The author is applying this framework to the automatic parallelization of C and Lisp programs in two parallelizing compilers at CSRD, called Parcel [Har89] and Miprac [HA89].

20545 (ANL–91/34, pp. 161) **Dataflow analysis of concurrent logic languages.** Foster, I. (Argonne National Lab., IL (United States)); Winsborough, W. Argonne National Lab., IL (United States). Nov 1991. (CONF-9110321–: Workshop on compilation of (symbolic) languages for parallel computers, San Diego, CA (United States), 31 Oct - 1 nov 1991). In *Proceedings of the workshop on Compilation of (Symbolic) Languages for Parallel Computers.* 176p. Order Number DE92006819. Source: OSTI; NTIS.

The authors present a framework for the definition and verification of static analyses of concurrent logic programming languages. They illustrate the framework by constructing an analysis to recognize consumers that receive data structures that have no other consumer. Such information enables a compile-time decision to reuse data-structure storage when the consumer is done with it. The principal feature of the analyses constructed using their approach is that they need not simulate directly the numerous possible interleavings of process reductions that can occur during execution of a parallel program. This feature is intended to make their analyses affordable.

20546 (ANL–91/34, pp. 162) **Compiler support for the refinement and composition of process structures.** Foster, I. (Argonne National Lab., IL (United States)). Argonne National Lab., IL (United States). Nov 1991. (CONF-9110321–: Workshop on compilation of (symbolic) languages for parallel computers, San Diego, CA (United States), 31 Oct - 1 nov 1991). In *Proceedings of the workshop on Compilation of (Symbolic) Languages for Parallel Computers.* 176p. Order Number DE92006819. Source: OSTI; NTIS.

The author presents recent work concerned with the specification of spatial organization in parallel programs. First, he describes linguistic constructs (defined as extensions to the parallel programming language PCN) that allow specifications for the logic and physical layout of a parallel program to be developed simultaneously, in the same stepwise refinement process. These constructs (described in the attached paper) proved a natural framework for the composition of programs defined in terms of specialized topologies, such as an FFT on a linear array. They also allow us to untangle the problems of specifying layout and program logic: the layout hierarchy can be modified independently of program logic to alter resource allocation decisions, changing performance but not correctness. Second, he describes the compiler techniques used to implement these constructs on distributed memory computers. Source-to-source transformations are used to translate programs augmented with the mapping constructs into simpler programs augmented with calls to mapping libraries. These mapping libraries encode expertise about optimal embeddings of complex topologies in particular physical machines. A novel aspect of the compiler is its use of a programmable transformation system called Program Transformation Notation (PTN). This provides a metalanguage for specifying program transformations.

20547 (ANL–91/34, pp. 163-172) **On the refinement and composition of process structures.** Foster, I. (Argonne National Lab., IL (United States)). Argonne National Lab., IL (United States). Nov 1991. DOE Contract W-31109-ENG-38. (CONF-9110321–: Workshop on compilation of (symbolic) languages for parallel computers, San Diego, CA (United States), 31 Oct - 1 nov 1991). In *Proceedings of the workshop on Compilation of (Symbolic) Languages for Parallel Computers.* 176p. Order Number DE92006819. Source: OSTI; NTIS.

The author has defined a framework within which the familiar ideas of refinement, hierarchy, composition, and reuse can be applied to the development of parallel programs. The key idea underlying this framework is the use of spatial layout as an organizational principle: a context in which to specify replication, composition, communication, and other important issues. The approach has a number of important benefits. First, the ability to embed virtual topologies inside other virtual or physical topologies (by remapping, restriction, or expansion) makes it possible to build complex programs by the composition of simpler programs. This is the case even if subprograms are defined in terms of different topologies. Second, design decisions concerning resource allocation and spatial organization can be decoupled from program logic, as such decisions are expressed in the composition that combines subprograms, not the subprograms themselves. Third, virtual topologies allow the underlying physical topolgy to be either hidden or made visible at various levels of abstraction. This makes it possible both to achieve portability and to write programs that exploit aspects of the underlying hardware. Fourth, virtual topologies provide a convenient context for embedding various data-parallel operations in a MIMD context. For example, it is straightforward to define programs that perform reductions, broadcasts, or SIMD/SPMD computations within a topology.

20548 (ANL/CP-74367) **Comparison of two inductive learning methods: A case study in failed fuel identification.** Reifman, J. (Argonne National Lab., IL (United States)); Lee, J.C. Argonne National Lab., IL (United States). [1992]. 16p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38. (CONF-920538-16: 8. power plant dynamics, control and testing symposium, Knoxville, TN (United States), 27-29 May 1992). Order Number DE92011843. Source: OSTI; NTIS; INIS; GPO Dep.

Two inductive learning methods, the ID3 and Rg algorithms, are studied as a means for systematically and automatically constructing the knowledge base of expert systems. Both inductive learning methods are general-purpose and use information entropy as a discriminatory measure in order to group objects of a common class. ID3 constructs a knowledge base by building decision trees that discriminate objects of a data set as a function of their class. Rg constructs a knowledge base by grouping objects of the same class into patterns or clusters. The two inductive methods are applied to the construction of a knowledge base for failed fuel identification in the Experimental Breeder Reactor II. Through analysis of the knowledge bases generated, the ID3 and Rg algorithms are compared for their knowledge representation, data overfitting, feature space partition, feature selection, and search procedure.

20549 (ANL/CP-74903) **Benchmark problems in which equality plays the major role.** Lusk, E.; Wos, L. Argonne National Lab., IL (United States). [1992]. 5p. Sponsored by USDOE, Washington, DC (United States); National Science Foundation, Washington, DC (United States). DOE Contract W-31109-ENG-38. Grant CCR-8810947. (CONF-9206156-1: 11. conference on automated deduction, Saratoga Springs, NY (United States), 15-18 Jun 1992). Order Number DE92013058. Source: OSTI; NTIS; GPO Dep.

We have recently heard rumors that researchers are again studying paramodulation [Wos87] in the context of strategy for its control. In part to facilitate such research, and in part to provide test problems for evaluating other approaches to equality-oriented reasoning, we offer in this article a set of benchmark problems in which equality plays the dominant role. The test problems are taken from group theory, Robbins algebra, combinatory logic, and other areas. For each problem, we include appropriate clauses and comment as to its status with regard to provability by an unaided automated reasoning program.

20550 (ANL/CP-75316) **Simulation meets reality: Chemical hazard models in real world use.** Newsom, D.E. Argonne National Lab., IL (United States). [1992]. 4p. Sponsored by Federal Emergency Management Agency, Washington, DC (United States); Department of Transportation, Washington, DC (United States). DOE Contract W-31109-ENG-38. (CONF-920428-4: Annual international nuclear power plant simulators conference, Orlando, FL (United States), 6-9 Apr 1992). Order Number DE92010905. Source: OSTI; NTIS; GPO Dep.

In 1989 the US Department of Transportation (DOT), Federal Emergency Management Agency (FEMA), and US Environmental Protection Agency (EPA) released a set of models for analysis of chemical hazards on personal computers. The models, known collectively as ARCHIE (Automated Resource for Chemical Hazard Incident Evaluation), have been distributed free of charge to thousands of emergency planners and analysts in state governments, Local Emergency Planning Committees (LEPCs), and industry. Under DOT and FEMA sponsorship Argonne National Laboratory (ANL) conducted workshops in 1990 and 1991 to train federal state local government, and industry personnel, both end users and other trainers, in the use of the models. As a result of these distribution and training efforts ARCHIE has received substantial use by state, local and industrial emergency management personnel.

20551 (ANSTO-M-120) **Automation of the ANSTO working standard of measurement for the activity of radionuclides.** Buckman, S.M. Australian Nuclear Science and Technology Organisation, Lucas Heights (Australia). Aug 1990. 105p. Order Number DE92627146. Source: OSTI; NTIS (US Sales Only); INIS.

The ANSTO working standard ion chamber is used routinely for the standardisation of a range of gamma emitting radio-isotopes. The ion chamber has recently been automated by replacing the AAEC type 292 Recycling Discriminator, timer module and model 43 teletype printer with the HP86B computer, HP-59501B voltage programmer and HP-6181C current source. The program 'MEASION', running on the Deltacom IBM AT clone, calculates the radioactivity, with full error statements, from the ion chamber measurements. Each of these programs is listed and discussed. 13 refs., 5 figs., tabs.

20552 (BONN-IR-92-04) **Development of the parallel calculator system BOSS for the evaluation of the measurement data of the SAPHIR experiment.** Manns, J. Bonn Univ. (Germany). Physikalisches Inst.; Bonn Univ. (Germany). Mathematisch-Naturwissenschaftliche Fakultaet. Feb 1992. 77p. (In German). Order Number DE92517031. Source: OSTI; NTIS (US Sales Only); INIS.

The BOSS parallel computing system has been developed for the SAPHIR experiment at the Bonn stretcherring ELSA. The hardware of BOSS consists of some UNIX workstations connected with a standard ETHERNET link. The system will automatically distribute tasks to optimize the use of the computing power of all machines. The elements of parallism are programs which are connected using TCP/IP channels. The system was designed to allow the complete software development to be done under VAX/VMS. Most of this software can be executed using the BOSS system without any modifications. BOSS can be controlled interactively using VAX/VMS syntax style or Motif/X11 from either VAX/VMS or UNIX. The concept of forming more than one program to be a parallel task makes use of the batch queue system of BOSS. Since tasks are formed of modulus, a program can run without any internal changes in an offline or online environment or get its input from other programs as in a simulation by simply replacing some modules. The BOSS system has been under test since spring 1991. (orig.).

20553 (CONF-911103-8) **Graphical development tools for network-based concurrent supercomputing.** Beguelin, A. (Tennessee Univ., Knoxville, TN (United States). Dept. of Computer Science); Dongarra, J.; Geist, A.; Manchek, R.; Sunderam, V. Oak Ridge National Lab., TN (United States). [1991]. 11p. Sponsored by USDOE, Washington, DC (United States); National Science Foundation, Washington, DC (United States). DOE Contract AC05-84OR21400. Contract CCR-8809615. From Conference on supercomputing '91; Albuquerque, NM (United States); 14-16 Nov 1991. Order Number DE92011144. Source: OSTI; NTIS; GPO Dep.

This paper describes an X-window based software environment called HeNCE (Heterogeneous Network Computing Environment) designed to assist scientists in developing parallel programs that run on a network of computers. HeNCE is built on top of a software package called PVM which supports process management and communication between a network of heterogeneous computers. HeNCE is based on a parallel programming paradigm where an application program can be described by a graph. Nodes of the graph represent subroutines and the arcs represent data dependencies. HeNCE is composed of integrated graphical tools for creating compiling executing and analyzing HeNCE programs.

20554 (CONF-920466-6) **Process simulation in waste management.** Ferrada, J.J. (Oak Ridge National Lab., TN (United States)); Jackson, J.R.; Leach, P.V. Oak Ridge National Lab., TN (United States). [1992]. 21p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. From Engineering and technology conference on waste management and environmental restoration; San Juan (Puerto Rico); 9-11 Apr 1992. Order Number DE92011677. Source: OSTI; NTIS; GPO Dep.

Waste minimization is an important component of any organization's waste management program and is being increasingly demanded by upper management. The major objective of waste minimization is to reduce the amount of waste, the hazard of waste, or the difficulty in managing the waste by modifying raw materials, feed preparation, and the generating process, or altering effluent streams. Thus, waste management process simulation programs are a real necessity for conducting appropriate analyses of the existing processes that produce waste or modifying the existing processes to diminish waste production. This paper discusses the simulation package being developed at Oak Ridge National Laboratory. An effort to develop a new simulation package has started at ORNL in the Chemical Technology Division. The purpose of developing this package is to make it available to all DOE installations for their own use in waste management and process analysis. One of the necessary features of the simulation package is user friendliness. User friendliness, for the development of this program is understood as a characteristic of the computer program that provides easy access to the process unit operations, a simple question-answer interface for data input, and straightforward program execution commands.

20555 (CONF-9204106-3) **HeNCE: Graphical development tools for network-based concurrent computing.** Beguelin, A. (Oak Ridge National Lab., TN (United States)); Dongarra, J.; Geist, A.; Manchek, R.; Moore, K.; Wade, R.; Sunderam, V. Oak Ridge National Lab., TN (United States). [1992]. 8p. Sponsored by USDOE, Washington, DC (United States); National Science Foundation, Washington, DC (United States). DOE Contract AC05-84OR21400 ;FG05-91ER25105. CCR-8809615. From Scalable high performance computing conference; Williamsburg, VA (United States); 26-29 Apr 1992. Order Number DE92011061. Source: OSTI; NTIS; GPO Dep.

HeNCE (Heterogeneous Network Computing Environment) is an X Window based graphical parallel programming environment that was created to assist scientists and engineers with the development of parallel programs. HeNCE provides a graphical interface for creating, compiling, executing, and debugging parallel programs, as well as configuring a distributed virtual computer (using PVM). HeNCE programs can be run on a single Unix workstation or over a network of heterogeneous machines. This paper describes the purpose and use of the HeNCE software.

20556 (CONF-9206152-1-Extd.Abst.) **Driving a car with custom-designed fuzzy inferencing VLSI chips and boards.** Pin, F.G.; Watanabe, Y. Oak Ridge National Lab., TN (United States). [1992]. 4p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. (CESAR-92/11A). From 1992 international joint technology workshop on fuzzy logic and neural networks; Houston, TX (United States); 1-3 Jun 1992. Order Number DE92011688. Source: OSTI; NTIS; GPO Dep.

20558 (DOE/ER/25105-1) **Network based high performance concurrent computing: Progress report, [FY 1991].** Sunderam, V.S. Emory Univ., Atlanta, GA (United States). [1991]. 6p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG05-91ER25105. Order Number DE92011939. Source: OSTI; NTIS; GPO Dep.

The overall objectives of this project are to investigate research issues pertaining to programming tools and efficiency issues in network based concurrent computing systems. The basis for these efforts is the PVM project that evolved during my visits to Oak Ridge Laboratories under the DOE Faculty Research Participation program; I continue to collaborate with researchers at Oak Ridge on some portions of the project.

20559 (DOE/SA-0006) **Virtual Memory System (VMS) system security guideline.** USDOE Office of Security Affairs, Washington, DC (United States). Apr 1992. 44p. Sponsored by USDOE, Washington, DC (United States). Order Number DE92013694. Source: OSTI; NTIS (US Sales Only); GPO Dep.

The VAX/VMS environment provides unique built-in security control features for implementation by a system administrator. However, if the necessary controls are not in place, any or all of the VAX/VMS security mechanisms can be easily bypassed. The following sections describe the primary set of security controls available for version 4 Virtual Memory Systems (VMS). This document attempts to cover the most important aspects of VMS security. Section 3 provides a checklist summarizing the primary topics covered in this document for use by experienced system administrators. Section 4 describes those areas considered of primary importance for security of every type of system. Section 5 provides information on additional security concerns that could be useful for some systems, depending on the operating environment. Section 5 also includes information on the additional VMS control needed to meet the Department of Defense C2 rating and DEC security updates. The list of references given in section 6 provide further information on VMS security. Where applicable, the necessary controls needed to meet the minimum security requirements defined in the Department of Energy Order 5637.1 are included. The term system administrator is used throughout the document to refer to the person who implements the commands contained in this guide. It is assumed that the system administrator is a system manager or security officer since system privileges are required to execute many of the commands in this guide.

20560 (EGG-10617-6085) **An alternative to sneakernet.** Orrell, S.; Ralstin, S. EG and G Energy Measurements, Inc., Albuquerque, NM (United States). Kirtland Operations. [1992]. 19p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC08-88NV10617. (CONF-9205130-1: DOE computer security group conference, Las Vegas, NV (United States), 4-7 May 1992). Order Number DE92011146. Source: OSTI; NTIS; GPO Dep.

Many computer security plans specify that only a small percentage of the data processed will be classified. Thus, the bulk of the data on secure systems must be unclassified. Secure limited access sites operating approved classified computing systems sometimes also have a system ostensibly containing only unclassified files but operating within the secure environment. That system could be networked or otherwise connected to a classified system(s) in order that both be able to use common resources for file storage or computing power. Such a system must operate under the same rules as the secure classified systems. It is in the nature of unclassified files that they either came from, or will eventually migrate to, a non-secure system. Today, unclassified files are exported from systems within the secure environment typically by loading transport media and carrying them to an open system. Import of unclassified files is handled similarly. This media transport process, sometimes referred to as sneaker net, often is manually logged and controlled only by administrative procedures. A comprehensive system for secure bi-directional transfer of unclassified files between secure and open environments has yet to be developed. Any such secure file transport system should be required to meet several stringent criteria. It is the purpose of this document to begin a definition of these criteria.

20561 (EGG-HFRU-10026) **Representing cognitive activities and errors in HRA trees.** Gertman, D.I. EG and G Idaho, Inc., Idaho Falls, ID (United States). [1992]. 15p. Sponsored by Nuclear Regulatory Commission, Washington, DC (United States).

DOE Contract AC07-76ID01570. Order Number DE92012358. Source: OSTI; NTIS; INIS; GPO Dep.

A graphic representation method is presented herein for adapting an existing technology–human reliability analysis (HRA) event trees, used to support event sequence logic structures and calculations–to include a representation of the underlying cognitive activity and corresponding errors associated with human performance. The analyst is presented with three potential means of representing human activity: the NUREG/CR-1278 HRA event tree approach; the skill-, rule- and knowledge-based paradigm; and the slips, lapses, and mistakes paradigm. The above approaches for representing human activity are integrated in order to produce an enriched HRA event tree – the cognitive event tree system (COGENT)– which, in turn, can be used to increase the analyst's understanding of the basic behavioral mechanisms underlying human error and the representation of that error in probabilistic risk assessment. Issues pertaining to the implementation of COGENT are also discussed.

20562 (EGG-NE–10137) **VENTURE/PC manual: A multidimensional multigroup neutron diffusion code system: Version 3.** Shapiro, A. (Cincinnati Univ., OH (United States)); Huria, H.C.; Cho, K.W. EG and G Idaho, Inc., Idaho Falls, ID (United States); Cincinnati Univ., OH (United States). Dec 1991. 103p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC07-76ID01570. Order Number DE92012361. Source: OSTI; NTIS; GPO Dep.

VENTURE/PC is a recompilation of part of the Oak Ridge BOLD VENTURE code system, which will operate on an IBM PC or compatible computer. Neutron diffusion theory solutions are obtained for multidimensional, multigroup problems. This manual contains information associated with operating the code system. The purpose of the various modules used in the code system, and the input for these modules are discussed. The PC code structure is also given. Version 2 included several enhancements not given in the original version of the code. In particular, flux iterations can be done in core rather than by reading and writing to disk, for problems which allow sufficient memory for such in-core iterations. This speeds up the iteration process. Version 3 does not include any of the special processors used in the previous versions. These special processors utilized formatted input for various elements of the code system. All such input data is now entered through the Input Processor, which produces standard interface files for the various modules in the code system. In addition, a Standard Interface File Handbook is included in the documentation which is distributed with the code, to assist in developing the input for the Input Processor.

20563 (ENEA-RT-INN–90-31) **Biunitary transformation and ordinary differential equations (part 2).** Dattoli, G.; Mari, C.; Torre, A.; Loreto, V.; Richetta, M. ENEA, Frascati (Italy). Centro Ricerche Energia - Area Energia e Innovazione. Mar 1991. 31p. (RT/INN–90-31). Order Number DE92506269. Source: OSTI; NTIS (US Sales Only).

The results of a recent reformulation of the theory of arbitrary order differential equations in terms of non-Hermitian operators is used to show that the invariant binorm is associated to a generalized Courant-Snyder invariant. Furthermore, the existence of higher order invariants associated to the Casimir operators of the group is indicated, utilized to treat higher order equations. The intrinsic super symmetric nature of the theory developed is also discussed. Finally, the relevance of the proposed mathematical technique to the design of fibre optics transport systems is showed.

20564 (ENEA-RT-INN–90-34) **Study of electromagnetic fields in electron RFQ structure.** Picardi, L.; Raimondi, P.; Ronsivalle, C. ENEA, Frascati (Italy). Centro Ricerche Energia - Area Energia e Innovazione. May 1991. 14p. (RT/INN–90-34). Order Number DE92506266. Source: OSTI; NTIS (US Sales Only).

The increasing interest in high brightness electron injectors, especially in regard to FEL applications, get to study the feasibility of a RFQ (Radio Frequency Quadrupole) for electrons. In this paper, the correct electromagnetic fields are derived for a structure where it is no longer possible to use the T-K electrostatic approximation because the beam aperture is not much smaller than the wavelength.

20565 (ETDE-IT–92-38) **Parametrizing free electron laser physics.** Dattoli, G.; Fang, H.; Giannessi, L.; Mezi, L.; Torre, A.; Caloi, R. ENEA, Frascati (Italy). Centro Ricerche Energia - Area Energia e Innovazione; Rome Univ. (Italy). 1991. 39p. (CONF-910249–2: International topical conference on research trends in coherent radiation generation and particle accelerators, La Jolla, CA (United States), 11-13 Feb 1991). Order Number DE92506264. Source: OSTI; NTIS (US Sales Only).

The free electron laser is a rather complicated device, its performance depends indeed on a large number of parameters and on the interplay between them. This note shows how an accurate choice of such parameters along with a suitable combination of them can be helpful to derive scaling laws relevant to e.g. the gain or output power. Such a view allows a kind of unitary description of the various effects occurring in free electron laser physics. In particular, the gain depression induced e.g. by the electron-beam energy spread is the same as that due to a finite width of the optical pulse.

20566 (FNAL-TM–1773) **Network load of X terminals at CDF.** Abar, F.; O'Reilly, C.; Wicklund, E. Fermi National Accelerator Lab., Batavia, IL (United States). Mar 1992. 9p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH03000. Order Number DE92011704. Source: OSTI; NTIS; GPO Dep.

As an aid to planning future usage of X terminals, the authors measured the network bandwidth used by X terminals on a single Ethernet in a typical application environment at Fermilab. The objectives were twofold. The first objective was to identify the impact of adding one more X terminal onto the CDF Ethernet . The second objective was to determine the maximum number of X terminals allowable on the CDF network. The findings reveal that an X terminal in this environment used, on average, 431 + /–45 bytes/second. This is quite small compared to the utilizable bandwidth of the thinwire Ethernet network (375 Kilobytes/second, equivalent to 30% of total bandwidth). This amounts to an averaged load of .034% on the network per X terminal. This paper addresses the network load solely. It does not address the loads imposed by X terminals on the memory and CPU of the host systems.

20567 (KCP–613-4742) **Help may be on the way, IEEE standard P1209: The recommended practice for the evaluation and selection of CASE tools.** Lackner, M.F.; Grice, J.V. Allied-Signal Aerospace Co., Kansas City, MO (United States). Kansas City Div. Nov 1991. 17p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-76DP00613. (CONF-9205128–2: Symposium on assessments of quality software development tools, New Orleans, LA (United States), 27-29 May 1992). Order Number DE92011343. Source: OSTI; NTIS; GPO Dep.

This paper explores what has transpired in the world of standards, specifically dealing with the Institute of Electrical and Electronic Engineers (IEEE) standard, P1209. This standard (currently in draft form) is concerned with the evaluation and selection of Computer Aided Software Engineering (CASE) tools. The formal title of the standard is The Recommended Practice for the Evaluation and Selection of CASE Tools. Additionally, a brief CASE tool philosophy is presented as introductory material and background information for this standard. The reasoning behind the ancillary information is to put CASE tools in their proper perspective within the software development and maintenance life cycles.

20568 (KIYaI–89-18) **A subroutine for calculation of γ-ray response function in the stilbene scintillators 30x30; 50x50 and 70x30 mm in the range E 1.5-10 MeV.** Gajdaenko, S.A.; Kadkin, E.P.; Shevchenko, S.V. AN Ukrainskoj SSR, Kiev (Ukraine). Inst. Yadernykh Issledovanij. 1989. 14p. (In Russian). Order Number DE92627147. Source: OSTI; NTIS (US Sales Only); INIS.

A subroutine for calculation of γ-ray response function in the stilbene scintillators 30x30, 50x50, 70x30 mm in the range E_γ1.5-10 MeV is presented. 6 refs.; 5 figs.

20569 (KIYaI–90-14) **On application of maximum entropy principle for restoring a radiation sources distribution.** Tokarevskij, V.V.; Shevchenko, S.V. AN Ukrainskoj SSR, Kiev (Ukraine). Inst. Yadernykh Issledovanij. 1990. 13p. (In Russian).

Order Number DE92627148. Source: OSTI; NTIS (US Sales Only); INIS.

The distribution restoring by maximum entropy method (MEM) is tested for radiation sources distribution. The radiation values are determined by means of maximization of likelihood function and entropy of distribution in question. The computer simulation was used. It is found that a dispersion of ME-estimate and a dispersion of full a priori information estimate are practically equal. 9 refs.; 5 tabs.

20570 (KIYal–90-21) **To the problem on the algorithm of radiation source detection on stationary noise.** Tokarevskij, V.V.; Shevchenko, S.V. AN Ukrainskoj SSR, Kiev (Ukraine). Inst. Yadernykh Issledovanij. 1990. 15p. (In Russian). Order Number DE92627149. Source: OSTI; NTIS (US Sales Only); INIS.

A number of criterions for a problem of radiation source detection on stationary noise by analysis of computer simulation time series data is investigated. The data have Poisson distribution. It is found, that criterion using maximum entropy estimation of radiation source distribution is more efficient then conventional one using maximum likelihood estimations. 7 refs.; 2 tabs.

20571 (LA-UR–92-805) **On the abstracted dataflow complexity of Fast Fourier Transforms.** Boehm, A.P.W. (Colorado State Univ., Fort Collins, CO (United States). Dept. of Computer Science); Hiromoto, R.E.; Kelly, K.A.; Ashley, J.M. Los Alamos National Lab., NM (United States). [1992]. 21p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-920730–3: ACM SIGARCH international conference on supercomputing, Washington, DC (United States), 19-24 Jul 1992). Order Number DE92011372. Source: OSTI; NTIS; GPO Dep.

In this paper we develop and analyze the simulated performance of codes for the Fast Fourier Transform written in If and targeted for execution on Motorola's dataflow machine Monsoon. The FFT application is of interest because of its computational parallelism, its requirement for global communications, and its array element data dependences. We use the parallel profiling simulator Id World to study the dataflow performance of various implementations. Our approach is comparative. We study two approaches, a recursive and an iterative one, and in each version we examine the effect of a variety of implementations. We contend that only through such comparative evaluations can significant insight be gained in understanding the computational and structural details of functional algorithms.

20572 (LA-UR–92-829) **Reconstruction based on flexible prior models.** Hanson, K.M. Los Alamos National Lab., NM (United States). [1992]. 10p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-920298–1: 6. SPIE conference on medical imaging, Newport Beach, CA (United States), 23-28 Feb 1992). Order Number DE92011263. Source: OSTI; NTIS; GPO Dep.

A new approach to Bayesian reconstruction is introduced in which the prior probability distribution is endowed with an inherent geometrical flexibility. This flexibility is achieved through a warping of the coordinate system of the prior distribution into that of the reconstruction. This warping allows various degrees of mismatch between the assumed prior distribution and the actual distribution corresponding to the available measurements. The extent of the mismatch is readily controlled through constraints placed on the warp parameters.

20573 (LA-UR–92-1048) **A dynamic menuing and security system.** Koon, D.M.; Zowin, J.A. Los Alamos National Lab., NM (United States). [1992]. 11p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-9205138–1: North American Ingres Users Association (NAIUA) meeting, Tarpan Springs, FL (United States), May 1992). Order Number DE92011229. Source: OSTI; NTIS; GPO Dep.

Commonly, a system creator will seek to limit access to various parts of an information system based on the user is and what authorities should be granted that person. With a payroll system, it would be expected that only a limited number of people would be able to change data, a larger segment of managers would be able to view information on their particular department, and perhaps everyone would be able to see their own information. This sort of situation presents an interesting problem for the system designer who would like to minimize the amount of coding necessary to accomplish this level of flexibility and to simplify maintenance of the application system. We were presented with such a problem with a project accounting system. The two first implementations of this application system were based on simply locking users out of screens for which they had no authority. A polite message was displayed indicating that the user did not have authority to access the screen in question. This method had the potential of becoming a security problem because the code was replicated in each of fifteen menus. Changes had to propagated around several different menus for several different levels of authorization. This created difficulty for us in maintaining a consistent set of key strokes throughout the system. Exceptions had to be handled via replicated code. These problems led us to re-evaluate the existing system and to create a system based on the following set of user requirements: access to functions must be based on the user's level of authority; all menus should require the basic keystrokes; menus to which a user dose not have authority should not be displayed to that user; and finally, so-called "super users" must be able to access data from the point of view of various sub-organizations.

20574 (M–276-Rev.1) **PANACEA User's Manual: Revision 1.** Brown, S.A. Lawrence Livermore National Lab., CA (United States). 16 Dec 1991. 56p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. Order Number DE92011289. Source: OSTI; NTIS; GPO Dep.

A numerical simulation code is fundamentally a device to solve an initial value problem. Very often these programs are written starting with the routines that solve some system of equations. Unless care is taken to formulate these routines with regard to a host of issues it can be very awkward to set up a problem or to look at the answers that the code returns. Furthermore, it can be nearly impossible to take advantage of some of the excellent work that various groups have done because the data flow and structuring issues have not been given sufficient attention in the program design stages. One way to avoid some of these difficulties is to write the data flow controls, the I/O mechanisms, and the database manager first. With these parts in place, there is a great deal of guidance for building the parts of a simulation code that deal with the specific set of equations to be solved; thus initial value data is fed in and the solution is written out clearly and conveniently. Furthermore, this approach provides a basis for defining some conventions to allow the sharing of simulation modules. It also helps isolate the machine dependencies of a code in a very few places, which greatly enhances the portability of the code. PANACEA is a library of routines built to address these issues. In essence, PANACEA attempts to embody all of the functionality of a numerical simulation code, which is generic to all simulation codes. It accomplishes this by implementing a model of the simulation as a system of services, which are bound together with the simulation specific routines provided by the code developer. One useful result of this approach is that it effectively imposes a discipline for the development of simulation codes that promote shareability, portability, and inter-operability.

20575 (NEI-NO–202) **Extrapolation methods for ordinary differential equations (ODE): continuous approximations, a parallel approach.** Simonsen, H.H. Trondheim Univ. (Norway). Norges Tekniske Hoegskole. Nov 1990 88p. Order Number DE92506528. Source: OSTI; NTIS (US Sales Only).

This thesis consists of the following three papers: Continuous approximations for extrapolation methods; Views on the solution of ordinary differential equations (ODE) on parallel computers; A parallel ODE solver based on extrapolation. The first paper presents ways of constructing interpolants for extrapolation methods in ODE's. Extrapolation based on the forward Euler and smoothed midpoint rule are examined in detail. The same schemes can be utilized both for extrapolation based on the backward Euler rule and for extrapolation based on any symmetric two-step method. The next paper discusses the use of parallel computers for solving ODE's. This paper attempts to identify some ODE problems that are good candidates for parallel execution. The third paper presents some experiments done with a parallel ODE solver based on extrapolation. These experiments were conducted on a two-processor CRAY computer. The work may have practical applications in fields like process simulation and control systems. 62 refs., 14 figs., 7 tabs.

20576 (ORNL/TM–11553) **Description of the National Highway Planning Network.** Peterson, B.E. Oak Ridge National Lab., TN (United States). Sep 1990. 29p. Sponsored by Department of Defense, Washington, DC (United States). DOE Contract AC05-84OR21400. Order Number DE92012414. Source: OSTI; NTIS; GPO Dep.

The National Highway Planning Network is a data base of major highways in the continental United States. It is a foundation for analytic studies of highway performance, for vehicle routing and scheduling problems, and for mapping purposes. The network is based on a set of roadways digitized from the National Atlas by the US Geological Survey. It has been enhanced at Oak Ridge National Laboratory by adding additional roads and attribute detail and correcting topological errors to produce a true analytic network. This documentation is intended primarily to assist users of this data base by describing its structure, data elements, and development.

20577 (ORNL/TM–11938, pp. 1-8) **Robotic mobility and cognitive maps.** Benda, C.M. (IBM, Charlotte, NC (United States)). Oak Ridge National Lab., TN (United States). Sep 1991. (CESAR–91/32;CONF-9110260–: 6. international symposium on methodologies for intelligent systems, Charlotte, NC (United States), 16-19 Oct 1991). In *Proceedings of the sixth international symposium on methodologies for intelligent systems (Poster Session).* 215p. Order Number DE92002382. Source: OSTI; NTIS.

This paper focuses on the acquisition and storage of environmental information by a mobile robot. The environment includes obstacles which must be mapped by the robot. A method for representing a robot moving through its environment is described. Algorithms used for storage and retrieval of environmental data are presented. The goal is to represent the data in what is known as a cognitive map which allows faster retrieval of the environmental data because of this representation's compact nature.

20578 (ORNL/TM–11938, pp. 9-20) **A quantitative analysis of reasoning for RMS.** Buisson, L.; Euzenat, J. Oak Ridge National Lab., TN (United States). Sep 1991. (CESAR–91/32;CONF-9110260–: 6. international symposium on methodologies for intelligent systems, Charlotte, NC (United States), 16-19 Oct 1991). In *Proceedings of the sixth international symposium on methodologies for intelligent systems (Poster Session).* 215p. Order Number DE92002382. Source: OSTI; NTIS.

For reasoning systems, it is sometimes useful to cache away the inferred values. Meanwhile, when the system works in a dynamic environment, cache coherence has to be performed, and this can be achieved with the help of a reasoning maintenance system (RMS). The questions to be answered, before implementing such a system for a particular application, are: how much is caching useful? Does the system need a dynamicity management system? Is a RMS suited (what will be its overhead)? The authors provide an application driven evaluation framework in order to answer these questions. The evaluation is based on the real work to be processed on the reasoning of the application. First, they express the action of caching and maintaining with two concepts: backword and forward cone effects. Then they quantify the inference time for those systems and find the quantification of the cone effects in the formulas.

20579 (ORNL/TM–11938, pp. 33-44) **Integrated reasoning through associative retrieval.** Eskridge, T. (New Mexico State Univ., Las Cruces (United States)). Oak Ridge National Lab., TN (United States). Sep 1991. (CESAR–91/32;CONF-9110260–: 6. international symposium on methodologies for intelligent systems, Charlotte, NC (United States), 16-19 Oct 1991). In *Proceedings of the sixth international symposium on methodologies for intelligent systems (Poster Session).* 215p. Order Number DE92002382. Source: OSTI; NTIS.

Traditional research in machine learning has taken a componential view of reasoning where deduction, induction, and analogy are studied separately with a different computational mechanism proposed for each. The author has designed and implemented a computational model in which small variations on a single mechanism, associative retrieval, can perform deductive, inductive and analogical reasoning. Similar notions of using a uniform mechanism to perform the three reasoning tasks have been proposed. His notion differs from these in that he employs the principles embodied in the Continuous Analogical Reasoning theory to constrain and focus what is retrieved, ensuring the retrieval of the most relevant, useful information available. This paper begins with a discussion of Continuous Analogical Reasoning, motivating the need for interactions between the stages of analogy and comparing it to Discrete Analogical Reasoning. It then describes the hybrid symbolic-connectionist knowledge representation and processing mechanisms of the ASTRA program. It is the unique combination of structure and processing in ASTRA which allows the complex, continuous interactions to take place among all stages of the analogical reasoning process. The system's behavior under different forms of reasoning is then discussed, which shows success in achieving integrated reasoning and provides impetus for future research.

20580 (ORNL/TM–11938, pp. 45-55) **A first order theory for representing space in knowledge-based scene generation.** Giunchiglia, E. (Univ. of Genoa (Italy)); Armando, A. Oak Ridge National Lab., TN (United States). Sep 1991. (CESAR–91/32;CONF-9110260–: 6. international symposium on methodologies for intelligent systems, Charlotte, NC (United States), 16-19 Oct 1991). In *Proceedings of the sixth international symposium on methodologies for intelligent systems (Poster Session).* 215p. Order Number DE92002382. Source: OSTI; NTIS.

The key idea of the work described in this paper is to use a declarative representation of space (based on first order logic) as well as a procedural one (based on a semantic network). The link between the two representation is made by semantic attachment, defining the semantic network to be the intended model of the first order theory. The paper describes how the author has modeled space, both syntactically and semantically.

20581 (ORNL/TM–11938, pp. 57-64) **Learning intermediate concepts in causal trees: A direct method.** Golmard, J. Oak Ridge National Lab., TN (United States). Sep 1991. (CESAR–91/32;CONF-9110260–: 6. international symposium on methodologies for intelligent systems, Charlotte, NC (United States), 16-19 Oct 1991). In *Proceedings of the sixth international symposium on methodologies for intelligent systems (Poster Session).* 215p. Order Number DE92002382. Source: OSTI; NTIS.

The author proposes an empirical but a direct method used to learn partially unknown causal tree structures. More specifically, he supposes that the intermediate layer of a three-layered causal tree is completely unknown. A set of examples where the root node and the bottom layer nodes are observed is available. The principle of the method is to compute a correlation matrix which is block diagonal according to the model. This structure is then found using a clustering algorithm. A simulation experiment highlights the potential usefulness of the method in practical situations. Finally, open problems are briefly reviewed.

20582 (ORNL/TM–11938, pp. 65-72) **Transformation-ordering iterative-deepening-A*.** Hall, L.O. (Univ. of South Florida, Tampa (United States)); Cook, D.J.; Thomas, W. Oak Ridge National Lab., TN (United States). Sep 1991. (CESAR–91/32;CONF-9110260–: 6. international symposium on methodologies for intelligent systems, Charlotte, NC (United States), 16-19 Oct 1991). In *Proceedings of the sixth international symposium on methodologies for intelligent systems (Poster Session).* 215p. Order Number DE92002382. Source: OSTI; NTIS.

Iterative-Deepening-A* (IDA*) is an optimal search technique which requires no intermediate state storage. It is suitable for large search spaces. It uses a fixed order for the children of a node to be expanded. Transformation-Ordering Iterative-Deepening-A* (TOIDA*) attempts to improve upon the performance of IDA* by dynamically improving the order nodes are expanded, based on results from previous depth limits. Using the Fifteen puzzle as an example, it is shown that TOIDA* may choose the optimal fixed ordering and generally chooses a good ordering saving a substantial number of node expansions. Empirical results show that the sequential version can provide significant improvements in the speed with which a solution is discovered and no penalty in storage requirements.

20583 (ORNL/TM–11938, pp. 73-82) **An improvement of weighting strategy in resolution-based automated reasoning.** Yonggi Kim (Florida State Univ., Tallahassee (United States)); Kohout, L.J. Oak Ridge National Lab., TN (United States). Sep 1991. (CESAR–91/32;CONF-9110260–: 6. international symposium on methodologies for intelligent systems, Charlotte, NC (United States), 16-19 Oct 1991). In *Proceedings of the sixth international symposium on methodologies for intelligent systems (Poster Session).* 215p. Order Number DE92002382. Source: OSTI; NTIS.

Resolution theorem prover systems form an important category of logical architectures in the field of Automated Reasoning. In this paper the authors outline a method for control of inferential strategies of resolution based architectures which employs the triangle fuzzy relational products and fast fuzzy relational algorithms. The method for speeding up the logical inference is tested in conjunction with the theorem prover called ITP. The fast fuzzy algorithm is used in resolution based automated reasoning to produce the weights of terms automatically. By using the weights extracted by the fast fuzzy algorithm, some of the fuzzy implication operators were compared.

20584 (ORNL/TM–11938, pp. 83-94) **Pattern recognition using the third and the fifth classes of dynamical systems.** Ying Liu (Savannah State Coll., GA (United States)); Hede Ma. Oak Ridge National Lab., TN (United States). Sep 1991. (CESAR–91/32;CONF-9110260–: 6. international symposium on methodologies for intelligent systems, Charlotte, NC (United States), 16-19 Oct 1991). In *Proceedings of the sixth international symposium on methodologies for intelligent systems (Poster Session).* 215p. Order Number DE92002382. Source: OSTI; NTIS.

In this paper, dynamical systems are classified into eight classes by the authors. Thereafter, efficient methods are developed in this paper to recognize an input vector using the third and the fifth classes of dynamical systems defined by the authors. Patterns classified and recognized by a dynamical system are based on attractors of the system. Wolfram's cellular automata, Barnsley's iterated function systems (IFS), and ω-Orbit Finite automata proposed by the authors are used to illustrate the idea that how patterns can be recognized by the third and the fifth classes of dynamical systems, which is a more efficient approach than the existing methods.

20585 (ORNL/TM–11938, pp. 95-106) **Sensory integration.** McKee, G.T. (Univ. of Reading (United Kingdom)); Powner, E.T. Oak Ridge National Lab., TN (United States). Sep 1991. (CESAR–91/32;CONF-9110260–: 6. international symposium on methodologies for intelligent systems, Charlotte, NC (United States), 16-19 Oct 1991). In *Proceedings of the sixth international symposium on methodologies for intelligent systems (Poster Session).* 215p. Order Number DE92002382. Source: OSTI; NTIS.

Technology is moving slowly but surely towards the age of multisensor machines. Primitive versions of such machines have been around for some time. Primitive, that is, when compared to human beings, for they do not possess the full complement of sensors possessed by human beings, and the sensors they do possess are only a shadow of their human counterparts. Industrial robots are the typical example. The primitive character of these machines is reflected in the lack of any detailed theory of sensory systems, or indeed of any systematic methodology for engineering their sensory mechanisms. Of course, given their primitive nature, a detailed theoretical understanding is obviously of little importance, and likewise an engineering methodology. However, as technology moves towards more sophisticated sensory machines, and as the demand for the correct and efficient engineering of these machine increases, the need for this theory and methodology becomes both obvious and urgent. This paper is concerned with the integration of sensory data drawn from a heterogeneous set of sensors. A basic architecture for the sensory subsystem of an intelligent machine is developed, single modality and multiple modality sensory information processing are introduced, three levels are identified for sensory integration (single sensor, multiple sensor and multiple modality) and the forms of sensory integration required at each level are introduced and discussed.

20586 (ORNL/TM–11938, pp. 107-117) **Data structures + genetic operators = evolution programs.** Michalewicz, Z. (Univ. of North Carolina, Charlotte, (United States)); Schell, J.; Seniv, D. Oak Ridge National Lab., TN (United States). Sep 1991. (CESAR–91/32;CONF-9110260–: 6. international symposium on methodologies for intelligent systems, Charlotte, NC (United States), 16-19 Oct 1991). In *Proceedings of the sixth international symposium on methodologies for intelligent systems (Poster Session).* 215p. Order Number DE92002382. Source: OSTI; NTIS.

This paper discusses a new approach for solving constrained optimization problems using nonstandard genetic algorithms. The authors call this approach: evolution programming. They argue that a natural representation of a solution for a given problem plus a family of applicable genetic operators might be quite useful in the approximation of solutions of constrained optimization problems. They describe some experiments of using this approach.

20587 (ORNL/TM–11938, pp. 119-130) **Generic problem solving models in a computer-aided methodology for the construction of knowledge based systems.** Probst, A.R. (Univ. of Lausanne (Switzerland)); Horvitz, A.I.; Wenger, D. Oak Ridge National Lab., TN (United States). Sep 1991. (CESAR–91/32;CONF-9110260–: 6. international symposium on methodologies for intelligent systems, Charlotte, NC (United States), 16-19 Oct 1991). In *Proceedings of the sixth international symposium on methodologies for intelligent systems (Poster Session).* 215p. Order Number DE92002382. Source: OSTI; NTIS.

This paper describes a Computer Aided Knowledge Engineering (CAKE) tool that embodies a development methodology specially suited for the construction of knowledge based systems. The computer based tool also includes a library of predefined problem solving models called G-TECS (Generic Techniques). Categories of G-TECS are defined as classes and are organized in hierarchies. The inheritance and instanciation mechanism substantially ease the generation of specific applications. Reusability of predefined models is supported at a broad level.

20588 (ORNL/TM–11938, pp. 131-142) **Generation of production rules of backward search from neural networks.** Du Qun Qian (Olivetti Artificial Intelligence Center, Ivrea (Italy)); Scaruffi, P.; Russi, D. Oak Ridge National Lab., TN (United States). Sep 1991. (CESAR–91/32;CONF-9110260–: 6. international symposium on methodologies for intelligent systems, Charlotte, NC (United States), 16-19 Oct 1991). In *Proceedings of the sixth international symposium on methodologies for intelligent systems (Poster Session).* 215p. Order Number DE92002382. Source: OSTI; NTIS.

The rapid development of neural networks has attracted much attention of AI researchers. However, compared with the advantages that symbolic representations of knowledge in AI systems can be stated in a clear and relatively simple way, and can be easily documented, explained, taught and learned, neural networks have some disadvantages., i.e., the neural networks fail to offer an explanation function to the users. The users nearly always want to know why a neural network comes up with a particular answer. Sometimes they try to learn how the neural network makes decisions so that they can improve their own understanding of the problems; sometimes they want to verify that the neural network is working correctly. Therefore, by integrating neural networks with AI systems, the realization of some connectionist systems in different application areas have proven the viewpoint, i.e., the connectionist systems are more powerful than either of neural networks and AI systems. In order to overcome the above disadvantages of neural networks, this paper studies the generation of explicit representation of knowledge, namely, knowledge acquisition, from neural networks and explanation of the conclusions inferred by neural networks. In this paper, some heuristic backword search strategies for generating production rules and presenting some explanations to users are proposed.

20589 (ORNL/TM–11938, pp. 143-153) **Computational nonmonotonism and the qualification problem.** Rajasekar, A. (Univ. of Kentucky, Lexington (United States)). Oak Ridge National Lab., TN (United States). Sep 1991. (CESAR–91/32;CONF-9110260–: 6. international symposium on methodologies for intelligent systems, Charlotte, NC (United States), 16-19 Oct 1991). In *Proceedings of* *the sixth international symposium on methodologies for intelligent systems (Poster Session).* 215p. Order Number DE92002382. Source: OSTI; NTIS.

Human beings isolate qualification checking from general problem solving and do not check for all qualifications all the time. But, they are prepared to allow erroneous conclusions in favor of exhaustive checking. A strategy which has these human traits can be accepted as a possible solution for the qualification problem. In this paper the author develops a strategy, called computational nonmonotonism (CN), which mimics the above paradigm. In a CN system a qualification is applied only if it is relevant to a context or if it has a priority greater than a certain level warranted by the situation or scenario. The conclusions from a scenario can be different from another because of different qualifications which become applicable depending on the scenario. He applies computational nonmonotonism to a system of rules and qualifications and provide declarative and operational semantics for inferring from the system. He also shows the generality of the approach, by applying the computational nonmonotonism technique to default reasoning and circumscription. The three applications capture differing intuitions of computational nonmonotonism. He also points out that the approach can be adapted for real-time, time-constrained nonmonotonic reasoning.

20590 (ORNL/TM-11938, pp. 155-166) **Task allocation by a team of learning automata.** Seredynski, F. (Polish Academy of Sciences, Warsaw (Poland)). Oak Ridge National Lab., TN (United States). Sep 1991. (CESAR-91/32;CONF-9110260-: 6. international symposium on methodologies for intelligent systems, Charlotte, NC (United States), 16-19 Oct 1991). In *Proceedings of the sixth international symposium on methodologies for intelligent systems (Poster Session).* 215p. Order Number DE92002382. Source: OSTI; NTIS.

As computer architectures evolve towards massive parallelism, a major research question that has developed is the question of assigning modules of a program into a parallel computer for maximum performance. The problem belongs to a class of combinatorial optimization problems and is known as NP-complete. Various techniques have been treated lately for possible solutions. These solutions are based on application of mathematical programming, graph theory, branch and bound algorithms, or queuing theory. In this paper, parallel algorithm of static allocation of a program into parallel computer is proposed. The algorithm is seen as a sequence of games of learning automata team migrating in a computer system graph.

20591 (ORNL/TM-11938, pp. 167-177) **Notes on rough inference.** Shay, B. (Hunter Coll., New York, New York, (United States)). Oak Ridge National Lab., TN (United States). Sep 1991. (CESAR-91/32;CONF-9110260-: 6. international symposium on methodologies for intelligent systems, Charlotte, NC (United States), 16-19 Oct 1991). In *Proceedings of the sixth international symposium on methodologies for intelligent systems (Poster Session).* 215p. Order Number DE92002382. Source: OSTI; NTIS.

The author proposes a general strategy for defining theories of non-monotonic inference, and a particular theory for use in connection with methods for modeling uncertain belief and reasonable action. Although non-monotonic inference is defined without reference to subjective probability, my methods for modeling uncertain belief and reasonable action are based on subjective probability. He can guarantee that the lottery paradox will not arise in application of the particular theory in connection with these methods.

20592 (ORNL/TM-11938, pp. 191-202) **Inheritance in conceptual networks.** Leixuan Yang, (Univ. of Ottawa, Ontario, (Canada)); Szpakowicz, S. Oak Ridge National Lab., TN (United States). Sep 1991. (CESAR-91/32;CONF-9110260-; 6. international symposium on methodologies for intelligent systems, Charlotte, NC (United States), 16-19 Oct 1991). In *Proceedings of the sixth international symposium on methodologies for intelligent systems (Poster Session).* 215p. Order Number DE92002382. Source: OSTI; NTIS.

The authors present the inheritance system in a knowledge representation formalism called Conceptual Network. Exceptions can be represented in this formalism by means of conditions attached to conceptual relations. The explicit representation of exceptions allows one to implement monotonic inference for the inheritance problem. They look at the way in which their inheritance system works on some of the classical examples. This system offers a new approach to the inheritance problem, with a new representation method and a simple monotonic inference algorithm.

20593 (ORNL/TM-11938, pp. 203-214) **Combining symbolic and numeric representations in learning flexible concepts: The FCLS system.** Jianping Zhang (Utah State Univ., Logan (United States)). Oak Ridge National Lab., TN (United States). Sep 1991. (CESAR-91/32;CONF-9110260-: 6. international symposium on methodologies for intelligent systems, Charlotte, NC (United States), 16-19 Oct 1991). In *Proceedings of the sixth international symposium on methodologies for intelligent systems (Poster Session).* 215p. Order Number DE92002382. Source: OSTI; NTIS.

Many current methods of learning concepts from examples assume that concepts are precise entities, representable by a pure symbolic representation, and that concept examples are equally representative. Human concepts, however, are often flexible. They inherently lack precisely defined boundaries and have a central tendency, and their meaning is often context-dependent. Examples of these concepts are usually not all equivalent. This paper describes an approach to learning flexible concepts from examples. In this approach, a novel hybrid representation was introduced to represent flexible concepts. This hybrid representation is a combination of symbolic and numeric representations. An associate inductive learning algorithm was also represented. This approach was implemented in the Flexible Concept Learning System (FCLS) and tested on three different types of problems: the problems favorable for FCLS, the problems unfavorable for FCLS, and real world problems. The experimental results showed a strong support for the proposed flexible concept learning method.

20594 (ORNL/TM-12065) **Kendall Square multiprocessor: Early experiences and performance.** Dunigan, T.H. Oak Ridge National Lab., TN (United States). Apr 1992. 26p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. Order Number DE92013351. Source: OSTI; NTIS; GPO Dep.

Initial performance results and early experiences are reported for the Kendall Square Research multiprocessor. The basic architecture of the shared-memory multiprocessor is described, and computational and I/O performance is measured for both serial and parallel programs. Experiences in porting various applications are described.

20595 (PNL-7511-Ver.1.0) **Solid waste projection model: Database user's guide (Version 1.0).** Carr, F.; Stiles, D. Pacific Northwest Lab., Richland, WA (United States). Jan 1991. 24p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE91007890. Source: OSTI; NTIS; INIS; GPO Dep.

The Solid Waste Projection Model (SWPM) system is an analytical tool developed by Pacific Northwest Laboratory (PNL) for Westinghouse Hanford Company (WHC) specifically to address Hanford solid waste management issues. This document is one of a set of documents supporting the SWPM system and providing instructions in the use and maintenance of SWPM components. This manual contains instructions for preparing to use Version 1 of the SWPM database, for entering and maintaining data, and for performing routine database functions. This document supports only those operations which are specific to SWPM database menus and functions, and does not provide instructions in the use of Paradox, the database management system in which the SWPM database is established. 3 figs., 1 tab.

20596 (PNL-SA-17467) **Developments in computation, modeling and experimentation: Impacts on R&D.** Young, J.K. Pacific Northwest Lab., Richland, WA (United States). Oct 1989. 23p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. (CONF-8910571-1: ALCOA technical symposium on opportunities for computer science to advance materials science, Pittsburgh, PA (United States), 15-17 Oct 1989). Order Number DE92012351. Source: OSTI; NTIS; GPO Dep.

The original objective was to document the feasibility of the coordinated research program sponsored by ECUT called "Materials-by-Design (MBD)." The MBD program funds research to develop hierarchical models to predict materials' performance based on microstructural information. This paper was specifically prepared for this meeting to help technical staff and their managers justify and plan for an advanced computer infrastructure within their companies. In order to do this, several additional objectives for this paper are (1) to foster an appreciation of the dramatic increase in computational power that have occurred over the last forty years, (2) to encourage better utilization of supercomputing in current scientific research by identifying current issues and opportunities, and (3) to promote anticipation and enthusiasm for the dramatic changes supercomputers currently being developed will offer scientists in the near future.

20597 (SAND-89-2370) **RADTRAN 4: User guide: Volume 3.** Neuhauser, K.S. (Sandia National Labs., Albuquerque, NM (United States)); Kanipe, F.L. Sandia National Labs., Albuquerque, NM (United States). Jan 1992. 225p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-76DP00789. (TTC-0943). Order Number DE92012281. Source: OSTI; NTIS; INIS; GPO Dep.

RADTRAN 4 is used to evaluate radiological consequences of incident-free transportation, as well as the radiological risks from vehicular accidents occurring during transportation. This User Guide is Volume 3 in a series of four volume of the documentation of the RADTRAN 4 computer code for transportation risk analysis. The other three volumes are Volume 1, the Executive Summary; Volume 2, the Technical Manual; and Volume 4, the Programmer's Manual. The theoretical and calculational basis for the operations performed by RADTRAN 4 are discussed in Volume 2. Throughout this User Guide the reader will be referred to Volume 2 for detailed discussions of certain RADTRAN features. This User Guide supersedes the document "RADTRAN III" by Madsen et al. (1983). This RADTRAN 4 User Guide specifies and describes the required data, control inputs, input sequences, user options, program limitations, and other activities necessary for execution of the RADTRAN 4 computer code.

20598 (SAND-91-2790C) **A look at the development environment and tools used in a large INGRES ABF application project.** Eaton, M.J. Sandia National Labs., Albuquerque, NM (United States). [1991]. 9p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-76DP00789. (CONF-9205138-2: North American Ingres Users Association (NAIUA) meeting, Tarpan Springs, FL (United States), May 1992). Order Number DE92012632. Source: OSTI; NTIS; GPO Dep.

The organization of the INGRES ABF developer's environment trends to be an overlooked aspect of the application development process. Very often this environment develops haphazardly over time as deficiencies and new requirements are identified. This paper will describe some of the problems encountered and the solutions devised. The topics to be discussed are the following: the directory structure used to segregate the multitude of different files required by a large development effort; initialization command procedures for users and developers used to define the various symbols and logical names; file naming conventions; techniques used for configuration management and version control of ABF applications; procedures to assist the developers in quickly switching between the development and production versions of the databases; and tools developed to automate the generation of table and form documentation.

20599 (SAND-91-8230) **The twopnt program for boundary value problems: Version 3.10 of March 1992.** Grcar, J.F. Sandia National Labs., Livermore, CA (United States). Apr 1992. 92p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-76DR00789. Order Number DE92013394. Source: OSTI; NTIS; GPO Dep.

Twopnt is a computer program that finds steady state solutions for systems of differential equations, usually, in one space dimension. This is a guide to the program's use and a description of its operation.

20600 (UCRL-JC-107865) **Solution strategies for implicit nonlinear finite element analysis.** Engelmann, B.E.; Whirley, R.G. Lawrence Livermore National Lab., CA (United States). 8 Aug 1991. 8p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-911213-24: American Society of Mechanical Engineers (ASME) annual winter meeting, Atlanta, GA (United States), 1-6 Dec 1991). Order Number DE92011466. Source: OSTI; NTIS; GPO Dep.

The development of effective solution strategies to solve the global nonlinear equations which arise in implicit finite element analysis is an important area of research. Efficient strategies make good use of computational resources, and allow larger and more complex analysis models to be studies. Robust algorithms are essential to handle the complex nonlinearities which arise in many engineering applications, such as metalforming process simulation. Our research indicates that robustness can be best achieved in a general setting through adaptive solution strategies. This adaptivity and flexibility has been incorporated into an implicit nonlinear finite element code, NIKE2D. Temporal and algorithmic adaptivity is achieved through the development of ISLAND (Interactive Solution Language for an Adaptive Nike Driver). These new solution control features make NIKE2D a "smart code," and permit many new and challenging problems to be addressed. 3 refs.

20601 (UCRL-JC-108515) **Detecting intrusions through attack signature analysis.** Snapp, S.R. (Haystack Labs., Inc., Austin, TX (United States)); Mukherjee, B.; Levitt, K.N. Lawrence Livermore National Lab., CA (United States). 11 Oct 1991. 9p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-9108194-4: 3. workshop on computer security incident handling, Herndon, VA (United States), 6-8 Aug 1991). Order Number DE92011294. Source: OSTI; NTIS; GPO Dep.

Intrusion detection has generally been based on defining normal user behavior through profiles and rule-based systems and on identifying significant deviations from such behavior as anomalous. An alternative, or a supplementary, strategy for detecting intrusions is based on attack signature analysis, whose objective is to define and recognize events or sequences of events as attack-type behavior. Such event sequences, which may constitute part of a larger attack, may be employed to exploit certain system flaws or known vulnerabilities. This paper concentrates on attack signature analysis in general, and on a preliminary version of the signature analysis module of the distributed intrusion detection system (DIDS) in particular. A signature representation is developed, a number of attack scenarios and their corresponding signatures are outlined, and mechanisms to detect the signatures are discussed.

20602 (UCRL-JC-108548) **The CIAC Binary Inspector Tool (BIT): A nonintrusive vulnerability detection mechanism.** Brown, D.S. Lawrence Livermore National Lab., CA (United States). Oct 1991. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-9108194-5: 3. workshop on computer security incident handling, Herndon, VA (United States), 6-8 Aug 1991). Order Number DE92011948. Source: OSTI; NTIS (US Sales Only); GPO Dep.

This paper discusses the problem of detecting and fixing computer operating system and network vulnerabilities. A variety of methods have been tired in the past, and some are still in use these include: creating a specialized team or department and distributing vulnerability notices, conducting security audits, authorizing network attacks under controlled conditions, using intrusive vulnerability analysis tools, and using non-obtrusive vulnerability analysis tools. This paper discusses the advantages of the last approach, and describes an implementation of this approach, the Binary Inspector Tool (BIT). This tool searches compatible host file systems for known vulnerabilities of system binaries. It also displays the best patch or replacement binary to correct the vulnerability, as well as how to obtain the replacement (if possible). In this paper both the design of the BIT tool and directions for future development are also presented.

20603 (UCRL-JC-108973) **Code generation in ALPAL using symbolic techniques.** Cook, G.O. Jr. Lawrence Livermore National Lab., CA (United States). 30 Dec 1991. 11p. Sponsored by

USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-920760-2: International symposium on symbolic and algebraic computation, Berkeley, CA (United States), 27-29 Jul 1992). Order Number DE92011299. Source: OSTI; NTIS; GPO Dep.

In practice it takes far more time to program a numerical model than to derive it, especially for a nonlinear model or a model that is approximated by an implicit numerical technique. As part of an effort to simplify this part of the scientist's job, we have created A Livermore Physics Applications Language (ALPAL). ALPAL automatically generates Fortran or C code to numerically solve scientific problems that involve differential and integral equations. The scientist specifies the model and, optionally, the numerical methods with ALPAL using an almost natural language like that used in journal articles. ALPAL is unique in that it can generate highly efficient code, even for the very complicated mathematical problems that arise in large scientific simulation codes. This high level of power is achieved by use of symbolic techniques, including use of computer algebra facilities.

20604 (UCRL-JC-108993) **Does the user interface make interruptions disruptive? A study of interface style and form of interruption.** Storch, N.A. Lawrence Livermore National Lab., CA (United States). [1992]. 13p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-9205143-1: 1992 Association for Computing Machines (ACM) conference on human factor on computer systems, Monterey, CA (United States), 3-7 May 1992). Order Number DE92011295. Source: OSTI; NTIS; GPO Dep.

This experiment examined the influence to the style of the computer user interface on the extent to which performance was decreased by task interruption. Performance on data entry of a personnel database was compared using two different styles of interfaces, under three different forms of interruption. Ten subjects were given a graphical user interface with a mouse and screen buttons; and ten were given a character-based interface with tab and function keys. Interruptions came at unexpected times. Each subject was interrupted three times, once with each form of interruption: telephone call, visitor, and on-screen message. During each interruption, the subject was asked to answer a simple question. The number of fields entered minus the number of fields in error, per minute, was measured during the two-minute post-interruption period. Eye motion data was analyzed in terms of the amount of time and the average durations of eye fixations on the screen. An exit questionnaire solicited the subjects' perceptions of their performance.

20605 (UCRL-JC-109225) **New algorithms for the "minimal form" problem.** Oliveira, J.S. (Lawrence Livermore National Lab., CA (United States)); Cook, G.O. Jr.; Purtill, M.R. Lawrence Livermore National Lab., CA (United States). 20 Dec 1991. 9p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-920760-3: International symposium on symbolic and algebraic computation, Berkeley, CA (United States), 27-29 Jul 1992). Order Number DE92011963. Source: OSTI; NTIS; GPO Dep.

It is widely appreciated that large-scale algebraic computation (performing computer algebra operations on large symbolic expressions) places very significant demands upon existing computer algebra systems. Because of this, parallel versions of many important algorithms have been successfully sought, and clever techniques have been found for improving the speed of the algebraic simplification process. In addition, some attention has been given to the issue of restructuring large expressions, or transforming them into "minimal forms." By "minimal form," we mean that form of an expression that involves a minimum number of operations in the sense that no simple transformation on the expression leads to a form involving fewer operations. Unfortunately, the progress that has been achieved to date on this very hard problem is not adequate for the very significant demands of large computer algebra problems. In response to this situation, we have developed some efficient algorithms for constructing "minimal forms." In this paper, the multi-stage algorithm in which these new algorithms operate is defined and the features of these algorithms are developed. In a companion paper, we introduce the core algebra engine of a new tool that provides the algebraic framework required for the implementation of these new algorithms.

20606 (UCRL-JC-109251) **The multicomputer toolbox: Scalable parallel libraries for large-scale concurrent applications.** Skjellum, A.; Baldwin, C. Lawrence Livermore National Lab., CA (United States). 10 Dec 1991. 51p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-920730-2: ACM SIGARCH international conference on supercomputing, Washington, DC (United States), 19-24 Jul 1992). Order Number DE92008068. Source: OSTI; NTIS; GPO Dep.

In this paper, we consider what is required to develop parallel algorithms for engineering applications on message-passing concurrent computers. At Caltech, the first author studied the concurrent dynamic simulation of distillation column networks. This research was accomplished with attention to portability, high performance and reusability of the underlying algorithms. Emerging from this work are several key results: first, a methodology for explicit parallelization of algorithms and for the evaluation of parallel algorithms in the distributed-memory context; second, a set of portable, reusable numerical algorithms constituting a "Multicomputer Toolbox," suitable for use on both existing and future medium-grain concurrent computers; third, a working prototype simulation system, Cdyn, for distillation problems, that can be enhanced to address more complex flowsheeting problems in chemical engineering; fourth, ideas for how to achieve higher performance with Cdvn, using iterative methods for the underlying linear algebra. Of these, the chief emphasis in the present paper is the reusable collection of parallel libraries comprising the Toolbox. Concurrent algorithms for the solution of dense and sparse linear systems, and ordinary differential-algebraic equations were developed as part of this work. Importantly, we have embedded the notion of data distribution independence–support for algorithmic correctness independent of data locality choices–into the underlying methodology and practical software. This together with carefully designed message passing primitives, and concurrent data structures encapsulating data layout of matrices and vectors, provides an excellent basis for building and then tuning the performance of whole applications, rather than single computational steps.

20607 (UCRL-JC-109266) **The Matrix Editor for symbolic Jacobians in ALPAL.** Painter, J.F. Lawrence Livermore National Lab., CA (United States). Dec 1991. 13p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-920760-1: International symposium on symbolic and algebraic computation, Berkeley, CA (United States), 27-29 Jul 1992). Order Number DE92008076. Source: OSTI; NTIS; GPO Dep.

ALPAL is a Macsyma-based tool that automatically generates code to solve nonlinear integro-differential equations, given a very high-level specification of the equations to be solved and the numerical methods to be used. The Matrix Editor is a graphical, interactive tool for specifying the handling of Jacobian matrices and linear solvers. It automates such routine but difficult tasks as correctly converting from the data structures used for computing the Jacobian to data structures used by a linear solver. The user specifies what to do only at a high, natural level of abstraction.

20608 (UCRL-JC-109496) **PDDP: Data-driven parallelism and shared memory.** Warren, K.H.; Gorda, B.C. Lawrence Livermore National Lab., CA (United States). Dec 1991. 11p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-920730-1: ACM SIGARCH international conference on supercomputing, Washington, DC (United States), 19-24 Jul 1992). Order Number DE92008073. Source: OSTI; NTIS; GPO Dep.

The Parallel Data Distribution Preprocessor, PDDP, exploits the cycle time of local shared memory blocks to achieve efficient data parallelization on a MIMD distributed shared memory machine. Shared memory arrays are distributed among the processors. PDDP treats a subset of Fortran D primitives and provides semiautomatic parallelization when Fortran 90 array syntax is used.

20609 (UCRL-JC-109505) **A comparative study of the accuracy of various time domain nonorthogonal mesh methods.** Ray, S.L.; Rambo, P.W. Lawrence Livermore National Lab., CA

(United States). 21 Jan 1992. 6p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-920750–1: Institute of Electrical and Electronic Engineers-American Physical Society (IEEE-APS) international symposium, Chicago, IL (United States), 18-25 Jul 1992). Order Number DE92007300. Source: OSTI; NTIS; GPO Dep.

In recent years, a number of researchers have developed numerical methods for solving Maxwell's equations on irregular (nonuniform and nonorthogonal) meshes. These include curvilinear coordinate extensions of the FDTD method, staggered mesh finite volume and discrete surface integration methods, and Voronoi (Dirichlet/Delaunay) mesh methods. Some of these methods are applicable to meshes of quadrilaterals (in 2D), others to triangular grids, and others to either type of element. While all of these methods appear to work well, little is known about their relative accuracy. The standard method for studying the accuracy of discrete wave propagation methods is through dispersion analysis. This type of analysis provides practical information about the accuracy of a given discretization by quantifying the amount of dispersion, dissipation, and anisotropy that is introduced into the solution by the numerical scheme. It also provides a stability limit for the maximum stable time step size. Unfortunately, this analysis can not be applied on an irregular mesh. One can, however,analyze the dispersion characteristics of the uniform nonorthogonal meshes. These skewed meshes present an idealized but representative situation which can be treated analytically, thus providing a simple and powerful means for comparing disparate schemes.

20610 (UCRL-JC–109659) **A task adaptive parallel graphics rendering algorithm.** Whitman, S. Lawrence Livermore National Lab., CA (United States). Dec 1991. 21p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-920759–1: Siggraph '92, Chicago, IL (United States), 26-31 Jul 1992). Order Number DE92008062. Source: OSTI; NTIS; GPO Dep.

A parallel approach to computer graphics rendering is needed in order to generate images of highly complex data quickly. This paper presents such an algorithm which can be used on general purpose multiprocessor computers. It was designed for a physically-distributed, logically-shared memory computer with features amenable to both shared memory and message passing implementation. The work decomposition strategy involves assigning rectangular screen space areas to processors initially. Then, as the computation proceeds, processors which have completed their work adaptively partition another processor's task in order to even the computational load. Results on the BBN TC2000 computer at LLNL for this algorithm indicate an efficiency ranging from 59% to 90% on 96 processors for a variety of test images. In fact, a rendering speed of almost 100,000 polygons per second (anti-aliased, specular highlighted) was achieved at this configuration using the software algorithm described here.

20611 (UCRL-JC–109774) **SISAL: Toward resolving the parallel programming crisis.** Cann, D.; Wolski, R.; Feo, J. Lawrence Livermore National Lab., CA (United States). 2 Mar 1992. 8p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-920390–2: WHP92 on heterogeneous processing, Beverly Hills, CA (United States), 23-24 Mar 1992). Order Number DE92010716. Source: OSTI; NTIS; GPO Dep.

Sisal (Streams and Iterations in Single Assignment Language) is a functional language for numerical computation on both conventional and novel multiprocessor systems. In this paper, we discuss the Sisal project; illustrate SISAL's performance in comparison to sequential and parallel FORTRAN; and identify the project's future directions. We demonstrate that one can raise the level of program abstraction without sacrificing performance. SISAL programs are efficient, portable, determinate, and free of the burden thwarting parallel program is development. Without question, functional programming can resolve today's parallel programming crisis.

20612 (UCRL-LR–103220-Vol.3) **MGA: A gamma-ray spectrum analysis code for determining plutonium isotopic abundances: Volume 3, FORTRAN listing of the GA code.** Gunnink, R. Lawrence Livermore National Lab., CA (United States). 1 Sep 1991. 99p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. Order Number DE92012232. Source: OSTI; NTIS; GPO Dep.

Nondestructive measurements of x-ray and gamma-ray emissions can be used to determine the abundances of various actinides in a sample. Volume 1 of this report describes the methods and algorithms we have developed to determine the relative isotopic abundances of actinides in a sample, by analyzing gamma-ray spectra obtained using germanium detector systems. Volume 2 is a guide to using the MGA (Multiple Group Analysis) computer program we have written to perform plutonium isotopic analyses. This report contains a listing of the FORTRAN instructions of the code.

20613 (UCRL-LR–109666) **A model for/ extending the behavior of annotations.** Garcia, A.M. Lawrence Livermore National Lab., CA (United States). Dec 1991. 73p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. Order Number DE92011731. Source: OSTI; NTIS; GPO Dep.

This thesis explores the use of Extensible Annotations to assist users in performing procedural tasks described in guideline documents. Extensible Annotations (EA's) are regular annotations with extended properties and functionality. They contain attributes provided by the system or defined by the user; they include links to their anchor document or task, and perhaps to other documents or EA's. All Extensible Annotations are based on an Object-Oriented class hierarchy model, and links between EA's and documents follow a hypertext network model. A prototype implementation of the system has been created for demonstrating the effectiveness of the Extensible Annotational Facility.

20614 (UCRL-MA–108721) **ISLAND: Interactive solution language for an adaptive NIKE driver: User Manual.** Engelmann, B.E.; Whirley, R.G. Lawrence Livermore National Lab., CA (United States). Oct 1991. 122p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. Order Number DE92011444. Source: OSTI; NTIS (documentation only); ESTSC (complete software package), P.O. Box 1020, Oak Ridge, TN 37831-1020; GPO Dep.

Effective solution strategies to solve the global nonlinear equations are a vital part of an implicit nonlinear finite element analysis code such as NIKE2D. Efficient strategies make good use of computational resources, and allow larger and more complex analysis models to be studied. Robust algorithms are essential to handle the complex nonlinearities which arise in many engineering applications, such as metalforming process simulation. Our research indicates that robustness can be best achieved through adaptive solution strategies. This adaptivity and flexibility has recently been incorporated into NIKE2D. Temporal and algorithmic adaptivity is achieved through the development of ISLAND (Interactive Solution Language for an Adaptive Nike Driver). This report serves as a User Manual for the ISLAND language and its application to the definition of adaptive solution strategies in NIKE2D. ISLAND substantially improves the robustness of NIKE2D when solving strongly nonlinear problems. In addition, ISLAND allows new classes of constrained problems to be solved which could not previously be studied. Applications span many process simulation problems, including superplastic forming. These new solution control features make NIKE2D a "smart code," and permit many new and challenging problems to be addressed.

20615 (WSRC-IM–90-83-6) **Reviews of computing technology: Fiber distributed data interface.** Johnson, A.J. Westinghouse Savannah River Co., Aiken, SC (United States). 1 Dec 1991. 34p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC09-89SR18035. Order Number DE92011374. Source: OSTI; NTIS; GPO Dep.

Fiber Distributed Data Interface, more commonly known as FDDI, is the name of the standard that describes a new local area network (LAN) technology for the 90's. This technology is based on fiber optics communications and, at a data transmission rate of 100 million bits per second (mbps), provides a full order of magnitude improvement over previous LAN standards such as Ethernet and Token Ring. FDDI as a standard has been accepted by all major computer manufacturers and is a national standard as defined by the American National Standards Institute (ANSI). FDDI will become part of the US Government Open Systems Interconnection Profile (GOSIP) under Version 3 GOSIP and will become an international standard promoted by the International Standards Organization (ISO). It is important to note that there are no competing standards for high performance LAN's so that FDDI acceptance is nearly universal. This technology report describes FDDI as a technology, looks at the applications of this technology, examine the current economics of using it, and describe activities and plans by the Information Resource Management (IRM) department to implement this technology at the Savannah River Site.

20616 (WSRC-MS–91-086) **Audit trails and PC control on Novell networks.** Cabot, A. Westinghouse Savannah River Co., Aiken, SC (United States). [1991]. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC09-89SR18035. (CONF-9105126–6: 14. DOE computer security group conference, Concord, CA (United States), 7-9 May 1991). Order Number DE92010695. Source: OSTI; NTIS; GPO Dep.

Although Novell Netware 286 provides excellent access control at both the server and the directory level, the record they make available through the accounting function leaves much to be desired. This paper presents two programs; the first is a BASIC program that converts the output of Novell's PAUDIT command into single line audit trails, providing an auditable record of server access. The second program, written in dBase III+, can be used to insure that all PC's accessing the LAN are recorded in an inventory data base. The subject network consists of six file servers connecting approximately 500 users at the main office of WSRC's Engineering and Projects Division. Hard copy and diskettes of the source code will be available.

20617 (WSRC-MS–91-230-Rev.1) **Computer applications for engineering/structural analysis: Revision 1.** Zaslawsky, M.; Samaddar, S.K. Westinghouse Savannah River Co., Aiken, SC (United States). [1991]. 19p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC09-89SR18035. (CONF-9110344–8-Rev.1: Westinghouse computer symposium, Monroeville, PA (United States), 21-22 Oct 1991). Order Number DE92013070. Source: OSTI; NTIS; GPO Dep.

Analysts and organizations have a tendency to lock themselves into specific codes with the obvious consequences of not addressing the real problem and thus reaching the wrong conclusion. This paper discusses the role of the analyst in selecting computer codes. The participation and support of a computation division in modifying the source program, configuration management, and pre- and post-processing of codes are among the subjects discussed. Specific examples illustrating the computer code selection process are described in the following problem areas: soil structure interaction, structural analysis of nuclear reactors, analysis of waste tanks where fluid structure interaction is important, analysis of equipment, structure-structure interaction, analysis of the operation of the superconductor supercollider which includes friction and transient temperature, and 3D analysis of the 10-meter telescope being built in Hawaii. Validation and verification of computer codes and their impact on the selection process are also discussed.

20618 (Y/DW–1094) **The MIG Program: Prioritization of maintenance work requests.** Davenport, C.M.; Hopper, L.E. Oak Ridge Y-12 Plant, TN (United States). Sep 1991. 69p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OS21400. Order Number DE92012107. Source: OSTI; NTIS; GPO Dep.

The Maintenance Importance Generator (MIG) program has been written to automatically prioritize all pending Oak Ridge Y-12 Plant maintenance jobs in conformity with DOE policy and regulatory requirements. The program captures and applies the knowledge and best practices of many experienced maintenance workers. Up to 40,000 work requests are prioritized or updated each week; maintenance foremen receive prioritized work-pending lists. MIG program results were uniformly good; it was implemented in the Metal Prep Division in August 1989 and has been in use for several months in other major production divisions. The program satisfied an Admiral Watkins' Tiger Team Top-10 Problem for Y-12 in 1990: "How to systematically prioritize work." The MIG program uses a weighted-factors method similar to that utilized by commercial, licensed methodologies for decision making. Each box on a Maintenance Work Request (MWR) form represents an importance factor. These factors were ranked relative to each other and were given appropriate weight increments by a consensus of maintenance and customer organization experts. Coordination was by the MIG program developers and included input from DOE and plant policy. The specific entry made by a customer in an MWR form box is read to determine the fraction of the box weight that will be applied to an accumulating priority number. Captured knowledge is used in this step. The straight sum of the weight increments of the individual factors is the final priority number. The weight increments and the captured knowledge represent the judgement of a decision committee that can be reused in a fully automatic process.

20619 (ANL/CP–69894) **A methodology for benchmarking distributed database management systems.** Orji, C.U. Argonne National Lab., IL (United States). [1990]. 24p. Sponsored by Veterans Administration, Washington, DC (United States); Department of Veterans Affairs, Washington, DC (United States). DOE Contract W-31109-ENG-38. (CONF-900875–1: 16. international conference on very large databases; 7. IEEE international conference on data engineering, Brisbane (Australia); Kobe (Japan), 13-16 Aug 1990; 8-12 apr 1991; CONF-9104321–2). Order Number DE90007801. Source: NTIS, PC A03/MF A01 - OSTI; GPO Dep.

A methodology for benchmarking distributed database management systems is proposed. A distributed environment is characterized in terms of the communication costs incurred in data movement between sites, the number of nodes that participate in processing a query and the data distribution scheme used in the network. These are used as a basis for identifying eight query types that capture the query performance characteristics in the network. Finally, an experimental outline is sketched to illustrate the steps in validating the methodology. 4 tabs.

20620 (CONF-920466–4) **Expert system for liquid low-level waste management.** Ferrada, J.J. Oak Ridge National Lab., TN (United States). [1992]. 16p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. From Engineering and technology conference on waste management and environmental restoration; San Juan (Puerto Rico); 9-11 Apr 1992. Order Number DE92011092. Source: OSTI; NTIS; INIS; GPO Dep.

An expert system prototype has been developed to support system analysis activities at the Oak Ridge National Laboratory (ORNL) for waste management tasks. This expert system will aid in prioritizing radioactive waste streams for treatment and disposal by evaluating the severity and treatability of the problem as well as the final waste form. The objectives of the expert system development included: (1) collecting information on process treatment technologies for liquid low-level waste (LLLW) that can be incorporated in the knowledge base of the expert system, and (2) producing a prototype that suggests processes and disposal technologies for the ORNL LLLW system. The concept under which the expert system has been designed is integration of knowledge. There are many sources of knowledge (data bases, text files, simulation programs, etc.) that an expert would regularly consult in order to solve a problem of liquid waste management. The expert would normally know how to extract the information from these different sources of knowledge. The general scope of this project would be to include as much pertinent information as possible within the boundaries of the expert system. As a result, the user, who may not be an expert in every aspect of liquid waste management, may be able to apply the content of the information to a specific waste problem. This paper gives the methodological steps to develop the expert system under this general framework.

20621 (DOE/ER–0533P) **FEDIX: The on-line database retrieval service of government information for colleges, universities, and other organizations: User's guide: Version 4.0/Release 2.0.** USDOE Office of Energy Research, Washington, DC (United States). Spr 1992. 79p. Sponsored by USDOE, Washington, DC (United States). Order Number DE92012384. Source: OSTI; NTIS; GPO Dep.

FEDIX is an on-line information service that links the higher education community and the federal government to facilitate research, education, and services. The system provides accurate and timely federal agency information to colleges, universities, and other research organizations. There are no registration fees and no access charges for using FEDIX. Agencies participating in the FEDIX system include: Department of Energy (DOE), Federal Aviation Administration (FAA), National Aeronautics and Space Administration (NASA), Office of Naval Research (ONR), Air Force Office of Scientific Research (AFOSR), National Science Foundation (NSF), National Security Agency (NSA), Department of Commerce (DOC), Department of Education (DOEd), Department of Housing and Urban Development (HUD), and Agency for International Development (AID). Additional government agencies are expected to join FEDIX in the near future. This guide is intended to help users access and utilize the FEDIX system. Because the system is frequently updated, however, some menus and tables used as examples in this text may not exactly match those displayed on the live system.

20622 (IIEC–92011741) **Technical Information Directory: An international directory of organizations that provide information on high efficiency energy technologies: First edition.** Grund, M.; Gronbeck, C. (comps.). International Inst. for Energy Conservation, Washington, DC (United States). Apr 1992. 108p. Sponsored by International Inst. for Energy Conservation, Washington, DC (United States). Source: OSTI; International Institute for Energy Conservation, 420 C Street, N.E., Washington, DC 20002.

Improved technologies and policy planning have made it possible for many industrialized countries to meet the demand for energy services with fewer energy resources. Many developing countries would like to employ such policies but have difficulty finding information about them. Energy policy planners at all levels invest significant resources researching technological and policy options for improving energy efficiency. The International Institute for Energy Conservation's (IIEC) Technical Information Directory addresses the problem of locating technical information. The directory profiles organizations that provide information on energy saving technologies and highlights useful materials and services they offer. The directory has two principle goals: to help individuals and institutions that do not have intimate knowledge of energy-saving technologies locate those that do, and to encourage the development of an international information sharing system to facilitate the sharing of information energy-saving technologies. The first edition primarily focuses on organizations that provide generic or non-product-specific information on energy-saving technologies. Many of the organizations profiled in these pages pursue additional activities that are beyond the scope of the directory. The Technical Information Directory evaluates only their ability to provide information on energy-saving technologies. All the information presented in the draft was drawn from materials produced by the organizations profiled or conversations with their staffs.

20623 (INIS-mf–13154) **Directory of IAEA databases.** International Atomic Energy Agency, Vienna (Austria). Nov 1991 118p. Order Number DE92628395. Source: OSTI; NTIS (US Sales Only); INIS.

The first edition of the Directory of IAEA Databases is intended to describe the computerized information sources available to IAEA staff members. It contains a listing of all databases produced at the IAEA, together with information on their availability.

20624 (INIS-SU–309/A, pp. 185-190) **Information-retrieval system for in-pile test methods and role of methodic information in planning investigations in the field of reactor materials testing.** Ivanov, V.B. (Nauchno-Issledovatel'skij Inst. Ehlektrofizicheskoj Apparatury, Leningrad (USSR)); Lebedeva, E.E.; Markina, N.V.; Tsykanov, V.A. AN Ukrainskoj SSR, Kharkov (Ukraine). Fiziko-Tekhnicheskij Inst. 1990. 227p. (In Russian). (CONF-9005247–: International conference on radiation material science, Alushta (USSR), 22-25 May 1990). In *Radiation materials science. V. 4.* Order Number DE92001357. Source: OSTI; NTIS (US Sales Only); INIS.

Particular role of methodic information in research planning and automatomization considered. It is shown that availability of methodic information makes it possible to justify the necessity for experimental equipment developing, to compare the possibilities created by different investigation methods and to carry out optimal choice of the experiment fulfilment place. Necessity for developing the information-retrieval system on in-pile test methods and the required set of data based is discussed. The information on the expert system realized on PC AT is presented. Advantages and usefulness of systematization and information acquisition on methodic developments are shown, practical recommendations on their use are given.

20625 (LA-UR–92-653) **Information systems for engineering sustainable development.** Leonard, R.S. Los Alamos National Lab., NM (United States). 27 Feb 1992. 35p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-9203126–1: Workshop on engineering partnerships for sustainable development in conjunction with prep con IV of the United Nations conference on environment and development, New York, NY (United States), 1-3 Mar 1992). Order Number DE92011271. Source: OSTI; NTIS; GPO Dep.

The ability of a country to follow sustainable development paths is determined to a large extent by the capacity or capabilities of its people and its institutions. Specifically, capacity-building in the UNCED terminology encompasses the country's human, scientific, technological, organizational, institutional, and resource capabilities. A fundamental goal of capacity-building is to enhance the ability to pose, evaluate and address crucial questions related to policy choices and methods of implementation among development options. As a result the United Nations Conference on Environment and Development (UNCED) Agenda 21 planning process has identified the need for better methods by which information can be transferred between industrialized nations and developing nations. The reasons for better methods of information transfer include facilitating decisions related to sustainable development and building the capacity of developing nations to better plan their future in both an economical and environmentally sound manner. This paper is a discussion on mechanisms for providing information and technologies available for presenting the information to a variety of cultures and levels of technical literacy. Consideration is given to access to information technology as well as to the cost to the user. One concept discussed includes an "Engineering Partnership" which brings together the talents and resources of private consulting engineers, corporations, non-profit professional organizations, government agencies and funding institution which work in partnership with each other and associates in developing countries. Concepts which are related to information technologies include a hypertext based, user configurable cultural translator and information navigator and the use of multi-media technologies to educate engineers about the concepts of sustainability, and the adaptation of the concept of metabolism to creating industrial systems.

20626 (NUREG–0910-Rev.2) **NRC comprehensive records disposition schedule: Revision 2.** Nuclear Regulatory Commission, Washington, DC (United States). Div. of Information Support Services. Mar 1992. 335p. Sponsored by Nuclear Regulatory Commission, Washington, DC (United States). Source: OSTI; NTIS; INIS; GPO.

Title 44 United States Code, "Public Printing and Documents," regulations cited in the General Services Administration's (GSA) "Federal Information Resources Management Regulations" (FIRMR), Part 201-9, "Creation, Maintenance, and Use of Records," and regulation issued by the National Archives and Records Administration (NARA) in 36 CFR Chapter XII, Subchapter B, "Records Management," require each agency to prepare and issue a comprehensive records disposition schedule that contains the NARA approved records disposition schedules for records unique to the agency and contains the NARA's General Records Schedules for records common to several or all agencies. The approved records disposition schedules specify the appropriate duration of retention and the final disposition for records created or maintained by the NRC. NUREG-0910, Rev. 2, contains "NRC's Comprehensive Records Disposition Schedule," and the original authorized approved citation numbers issued by NARA. Rev. 2 totally reorganizes the records schedules from a functional arrangement to an arrangement by the host office. A subject index and a conversion table have also been developed for the NRC schedules to allow staff to identify the new schedule numbers easily and to improve their ability to locate applicable schedules.

20627 (ORNL/TM–11938, pp. 21-32) **A strategy for the computation of conditional answers.** Demolombe, R. (ONERA/CERT, Toulouse (France)). Oak Ridge National Lab., TN (United States). Sep 1991. (CESAR–91/32;CONF-9110260–: 6. international symposium on methodologies for intelligent systems, Charlotte, NC (United States), 16-19 Oct 1991). In *Proceedings of the sixth international symposium on methodologies for intelligent systems (Poster Session).* 215p. Order Number DE92002382. Source: OSTI; NTIS.

The author considers non-Horn Deductive Data Bases (DDB) represented in a First Order language without function symbols. In this context the DDB is an incomplete description of the world. A first approach to reduce the incompleteness is to add to the DDB some kind of default rules, in order to automatically assume missing information. The second approach , which is adopted in this paper, is to provide to the user the conditions which guarantee the validity of the answer. These conditional answers are generated by standard reasoning, and not by default reasoning. Then the problem is the following: if T represents the DDB and q the query, and if there is no direct answer to q, one wants to derive the more general conditions c such that: $T \vdash q \leftarrow c$. He resents a strategy, GASP, designed for this purpose. It is defined by meta rules, and these meta rules can be used for a least fixpoint operator definition. He shows that the GASP strategy is always more efficient than another usual strategy called GALP. Since in the case of recursive definitions the answers may be infinite GASP has been adapted into GRASP in order to only compute ground conditional answers. He shows that the least fixpoint operator associated to GRASP computes the answer in a finite number of steps, even if the DDB contains recursive definitions.

20628 (ORNL/TM–11938, pp. 179-190) **Bottom-up evaluation in indefinite deductive databases.** Sunderraman, R. (Wichita State Univ. (Kansas)). Oak Ridge National Lab., TN (United States). Sep 1991. (CESAR–91/32;CONF-9110260–: 6. international symposium on methodologies for intelligent systems, Charlotte, NC (United States), 16-19 Oct 1991). In *Proceedings of the sixth international symposium on methodologies for intelligent systems (Poster Session).* 215p. Order Number DE92002382. Source: OSTI; NTIS.

A bottom-up approach to evaluate non-Horn rules in indefinite databases is presented. Tabular structures, called C-tables, are used to represent disjunctive facts. Algebraic operations on C-tables are used to evaluate non-Horn rules. The bottom-up approach computes the fixpoint semantics of disjunctive deductive databases.

20629 (UCRL-CR–110424) **Electronic Commerce user manual.** Lawrence Livermore National Lab., CA (United States). 10 Apr 1992. 293p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. Order Number DE92013067. Source: OSTI; NTIS; GPO Dep.

This User Manual supports the Electronic Commerce Standard System. The Electronic Commerce Standard System is being developed for the Department of Defense of the Technology Information Systems Program at the Lawrence Livermore National Laboratory, operated by the University of California for the Department of Energy. The Electronic Commerce Standard System, or EC as it is known, provides the capability for organizations to conduct business electronically instead of through paper transactions. Electronic Commerce and Computer Aided Acquisition and Logistics Support, are two major projects under the DoD's Corporate Information Management program, whose objective is to make DoD business transactions faster and less costly by using computer networks instead of paper forms and postage. EC runs on computers that use the UNIX operating system and provides a standard set of applications and tools that are bound together by a common command and menu system. These applications and tools may vary according to the requirements of the customer or location and may be customized to meet the specific needs of an organization. Local applications can be integrated into the menu system under the Special Databases & Applications option on the EC main menu. These local applications will be documented in the appendices of this manual. This integration capability provides users with a common environment of standard and customized applications.

20630 (INFO–0213) **Atomic energy control board. History backgrounder.** Atomic Energy Control Board, Ottawa, ON (Canada). Oct 1986. 21p. (In English, French). Order Number DE92628393. Source: OSTI; NTIS (US Sales Only); INIS.

The Atomic Energy Control Board (AECB) is a regulatory agency set up by the Government of Canada under the Atomic Energy Control Act of 1946 to assist the Government in its efforts to make provision for the control and supervision of the development, application and use of atomic energy and to enable Canada to participate effectively in measures of international control of atomic energy. It is also responsible for the administration of the Nuclear Liability Act, including the designation of nuclear installations and the prescription of basic insurance to be carried by the operators of such nuclear installations. An overview is presented of the AECB's evolution in chronological form, its major current activities, and some of the challenges expected in the next decade.

20631 (INIS-mf–13190) **The regulatory process for the decommissioning of nuclear facilities.** Bezpecnost Jadernych Zarizeni. Ceskoslovenska Komise pro Atomovou Energii, Prague (Czechoslovakia). 1991 18p. Translation of an IAEA publication (Safety series No. 105). International Atomic Energy Agency, Vienna 1990. (In Czech). Order Number DE92628386. Source: OSTI; NTIS (US Sales Only); INIS.

The objective of this publication is to provide general guidance to Member States for regulating the decommissioning of nuclear facilities within the established nuclear regulatory framework. The Guide should also be useful to those responsible for, or interested in, the decommissioning of nuclear facilities. The Guide describes in general terms the process to be used in regulating decommissioning and the considerations to be applied in the development of decommissioning regulations and guides. It also delineates the responsibilities of the regulatory body and the licensee in decommissioning. The provisions of this Guide are intended to apply to all facilities within the nuclear fuel cycle and larger industrial installations using long-lived radionuclides. For smaller installations, however, less extensive planning and less complex regulatory control systems should be acceptable. The Guide deals primarily with decommissioning after planned shutdown. Most provisions, however, are also applicable to decommissioning after abnormal event, once cleanup operations have been terminated. The decommissioning planning in this case must take account of the abnormal event. 28 refs., 1 fig.

20632 (UMG-DGEN–92-1) **Investigation and exploitation of the radiation in peaceful uses and its juridical protection mechanism.** Solorzano R, S.A. (Facultad de Ciencias Juridicas y Sociales, Universidad Mariano Galvez de Guatemala, Guatemala City (Guatemala)). Universidad Mariano Galvez de Guatemala, Guatemala City (Guatemala). Facultad de Ciencias Juridicas y Sociales. Oct 1991 95p. (In Spanish). Order Number DE92628384. Source: OSTI; NTIS (US Sales Only); INIS.

In is included in a brief way the radioisotopes and ionizing radiations application in Guatemala; the risk an the radioactive damage from the juridical point of view; the nuclear energy's juridical nature, without any doubt, has its place in the law's world causing several effects which we have to determine the civil responsabilities; we expose the Guatemala's civil order the objective responsability of the nuclear law and its foundation. We had to mention the different international organisms that have relationship between each other in this area, for example: International Atomic Energy Agency (IAEA): Its objetives and functions; Its services and attendance; juridical activities, etc. and as a national institution the general Directorate for the Nuclear Energy that belong to the energy and Mines Ministry, it is the charge of the sutdy, promotion, control, supervision, thechnical vigilance and investigate the use of the nuclear energy In the juridical mechanisms of the radiation applications, we find in Guatemala the "protection an environment improvement law" decree 68-86 of the Republic Congress; "the control, use and application of radioisotopes and ionizing radiation law (nuclear law) law decree 11-86 which is transcribed because it is related with the nuclear energy subject. The rules also emphasize because of the technical aspects requirement concurrence that develop the law's precepts. As a viable juridical mechanism to guarantee the nuclear damage indemnity it is considered in others contracts determined the necessary constitution of the civil responsability insurance of the nuclear damages to guarantee the right indemnity of it. Corporate Author Index

This index lists the corporate authors responsible for issuing the documents in this publication which are identified primarily by report number. The corporate names are entered in standardized forms as defined in ETDE/PUB–3, *International Energy: Research Organizations 1986–1990*. Each entry under a corporate name includes the document title and citation number. Three items of information may appear in parentheses: (1) an abbreviation to identify the document type, such as a report; (2) the country of publication, indicated by International Organization for Standardization (ISO) country code; and (3) the language of the document if non-English (R;CA;In French). Author affiliations are not listed in this index.

A comparison of intramuscularly induced plasma levels of diminazene aceturate (Berenil^{R}), homidium bromide (Ethidium^{R}) and isometamidium chloride (Samorin^{R}) in infected and uninfected cattle, 17:19835 (RA;XA)
A study of factors affecting the persistence of deltamethrin applied to cotton fabric for tsetse fly control, 17:19848 (RA;XA)
Activities of the tsetse control unit, Botswana, 17:19860 (RA;XA)
Animal trypanosomiasis control in Uganda, 17:19861 (RA;XA)
Application of antigen-ELISA for the diagnosis of surra in selected camel herds in Kenya, 17:19832 (RA;XA)
Biosynthesis of lipids in female tsetse flies following matings with radiation-sterilized or normal males, 17:19841 (RA;XA)
Comparative study on the susceptibility of different Glossina species to trypanosoma vivax, T. congolense or T. b. brucei, 17:19842 (RA;XA)
Control of Glossina austeni and cattle trypanosomiasis in Unjuga island by deltamethrin pour-on application to livestock and with stationary targets in cattle-free zones, 17:19857 (RA;XA)
Development of controlled release formulations of pesticides using nuclear techniques for the control of tsetse flies, 17:19851 (RA;XA)
Effect of irradiation on tsetse flies, 17:19876 (RA;XA)
Experienced with odour baited insecticide impregnated targets for control of tsetse flies in Kenya, 17:19849 (RA;XA)
Fat and Haematin contents of male tsetse flies Glossina pallidipes and G. m. morsitans (Diptera: Glossinidae) caught in odour-baited traps and artificial refuges in Zimbabwe, 17:19839 (RA;XA)
Field testing of improved insecticide formulation for control of tsetse using baited targets, 17:19850 (RA;XA)
Genetic studies on Glossina morsitans and Glossina palpalis related to genetic control, 17:19846 (RA;XA)
Integrated tsetse management in Southwestern Ethiopia, 17:19854 (RA;XA)
Interim strategies to control animal trypanosomiasis in two selected villages along the white volta river in the onchocerciasis free zone of Northern Ghana, 17:19855 (RA;XA)
Investigations of intramuscularly induced diminazene aceturate (Berenil^{R}) plasma levels in cattle under high tsetse and trypanosome challenge in the field, 17:19834 (RA;XA)
Laboratory and field observations in relation to the release of sterile Glossina austeni on Unjuga (Zanzibar) island, 17:19858 (RA;XA)
Metabolite studies of isometamidium in cattle, 17:19837 (RA;XA)
Simple creation of controlled release formulations of insecticides by a polymeric spray tank additive, 17:19852 (RA;XA)
Solid phase extraction and reversed-phase high performance liquid chromatography of homidium in animal tissues, 17:19838 (RA;XA)
Sorbent extraction and high performance liquid chromatography (HPLC) of homidium bromide and isometamidium chloride in bovine plasma, 17:19836 (RA;XA)
Study of the vectorial capacity of Glossina palpalis palpalis related to its digestive physiology and rearing conditions, 17:19840 (RA;XA)
Study of tsetse-host immunity relationships with respect to mass rearing and tsetse eradication, 17:19844 (RA;XA)
The development and application of antigen-detection enzyme immunoassays (antigen-ELISA) for diagnosis and control of African trypanosomiasis, 17:19831 (RA;XA)
The durability of pyriproxyfen, a juvenile hormone mimic, for insect control, 17:19845 (RA;XA)
Trypanosomiasis control and eradication of Glossina austeni from Zanzibar using an integrated approach, 17:19856 (RA;XA)
Tsetse and trypanosomiasis at the Ngulia Rhino sanctuary, 17:19863 (RA;XA)
Tsetse and trypanosomiasis control in Zimbabwe, 17:19853 (RA;XA)
Tsetse and trypanosomiasis control for the rural development of Buvuma island, Lake Victoria, Uganda, 17:19862 (RA;XA)
Tsetse fly mass rearing: Colony management, deployment of sterile flies, related research and development, 17:19847 (RA;XA)
Tsetse, trypanosomiasis and cattle raising in southern Anambra state, Nigeria, 17:19859 (RA;XA)

Validation of the ELISA technique for diagnosis of trypanosomiasis in cattle in Uganda, 17:19833 (RA;XA)
Vectorial capacity of Glossina palpalis gambiensis after combined radiation and low temperature treatment during the late pupal stage, 17:19843 (RA;XA)

1/N-expansion and determination of resonance parameters in quantum mechanics, 17:19962 (IA;CS)

A measurement of the deuteron structure functions from deep inelastic muon scattering at high Q^2, 17:20183 (IA;CS)

Abnormally small yield of baryons and antibaryons as signal of quark-gluon plasma formation, 17:20226 (IA;CS)

About decays of light mesons into lepton pairs: three-dimensional theory and phenomenology, 17:20107 (IA;CS)

Absence of strange quarks in nucleons, 17:20149 (IA;CS)

Bound states of relativistic particles and Regge trajectories within the potential approach, 17:20153 (IA;CS)

Characteristics of $dp \to ppp\pi^-$ and $np \to pp\pi^-$reactions and deuteron wave function, 17:20182 (IA;CS)

Constraints, BRST-cohomology and stochastic quantization, 17:20004 (IA;CS)

Dilepton emission from non-perturbative quark-gluon plasma, 17:20232 (IA;CS)

Dynamical and explicit chiral symmetry breaking, 17:20038 (IA;CS)

Elastic scattering and the problem of transparent nucleon, 17:20003 (IA;CS)

Entropy scaling and multifractal analysis of multiplicity distributions, 17:20108 (IA;CS)

Extended BRS-method and gauge-independence of anomalies, 17:20000 (IA;CS)

Fermionic and gauge fields in interaction - a question of anomalies, 17:19999 (IA;CS)

Four-point meson-Green-functions in the strong coupling limit of lattice QCD, 17:20005 (IA;CS)

Global and local fluctuations in ultra-relativistic heavy-ion interactions, 17:20228 (IA;CS)

Hadron gas production in heavy ions collisions, 17:20230 (IA;CS)

Hadron spectra and collective transverse flow in ultrarelativistic nuclear collisions, 17:20103 (IA;CS)

Instantons and EMC-effect for spin-dependent function $g_1{}^p(x)$, 17:20152 (IA;CS)

Intermittent behaviour in the Ising model, 17:20002 (IA;CS)

$K_L \to \pi^0 e^+ e^-$ and CP-violation, 17:20109 (IA;CS)

Kinetic equations for the quark-gluon plasma and their semiclassical expansion, 17:20233 (IA;CS)

Non-trivial dynamical features of parton-parton scattering at the ISR, 17:20040 (IA;CS)

On confining aspects of relativistic configurational space, 17:20155 (IA;CS)

On contribution of instantons to nucleon sum rules, 17:20151 (IA;CS)

Quantum aspects of chiral soliton, 17:20148 (IA;CS)
Quark masses in heavy quarkonia potential models, 17:20154 (IA;CS)
Scalar glueball and coupled channels, 17:20006 (IA;CS)
Self-consistent transport equations and QCD plasma oscillations, 17:20039 (IA;CS)
Semiclassical limit, confinement and field configurations in lattice QCD, 17:20001 (IA;CS)
Shock-wave phenomena in relativistic nuclear collisions, 17:20227 (IA;CS)
Soft leptons and photons - a selective review, 17:20104 (IA;CS)
Strong corrections to thermal dilepton production from a quark-gluon plasma, 17:20231 (IA;CS)
Systematic approach to conserved quantities, 17:19961 (IA;CS)
The concept of J/ψ formation time and the p_T-dependence of J/ψ suppression, 17:20234 (IA;CS)
The decay $\tau \to 3\pi\nu_\tau$ and characteristics of a_1 meson, 17:20106 (IA;CS)
The fractal structure of multihadron production at high energies, 17:20102 (IA;CS)
The new physics on $\gamma\gamma$- and γe-colliders, 17:20105 (IA;CS)
Transverse momenta and energies in J/ψ production, 17:20041 (IA;CS)
Transverse momentum dependent angular distributions with applications to hadron-nucleus collisions, 17:20235 (IA;CS)
Transverse momentum distribution of lepton pairs in hadron-nuclear collisions, 17:20229 (IA;CS)
Vector mesons and chiral symmetry, 17:20037 (IA;CS)
Why the ratio $m_s/m_{aver} \approx 25$ and scale $m_{aver} \approx 5$ Mev are suspect, 17:20150 (IA;CS)
